Lewis R. Speare, a former president of the Bay State Automobile Association, is given at the head of that organization, having been elected at the annual meeting in Boston on Monday, 4th inst., to succeed Eliot C. Lee. Other officers elected were: Vice-president, Harland W. Whipple; treasurer, J. S. ..athaway; secretary, J. Fortescue. The following were elected to the board of directors for 1909: George W. McNear, C. F. Whitney, F. A. Hinchcliffe, Kenneth Blake and Dr. John F. Hovestadt. The board of directors have appointed the following committees for 1909: House committee, George W. McNear, R. W. Daniels, Dr. I. D. Carl, A. P. Underhill, J. Fortescue; entertainment committee, Victor A. Charles, G. Duthie Strachan, C. I. Campbell, N. B. Buxton, F. T. O'Brien, Eugene Selg; touring and contest committee, Kenneth M. Blake, F. E. Wing, Dr. J. F. Hovestadt, F. A. Hinchcliffe, C. J. Bailey, W. G. Schmunk; membership committee, Dr. Julius F. Hovestadt, J. Fortescue, C. F. Whitney; press committee, J. S. Hathaway, C. I. Campbell.

His commercial occupation as advertising manager of the Diamond Rubber Co. has shown its influence in the latest book from the pen of James A. Braden. His new work is titled "The Auto Boys."

WILL TRY "BUMP-THE-BUMPS"

Plan to Avoid Accidents at Crossings to be Tested on Long Island Railroad—Design for "Bumps" Drawn.

"Bump-the-bumps" experiences are to eache motorists the wisdom of slowing down at railroad crossings on Long Island. That the plan was under consideration by the officials of the Long Island Railroad was announced in the Motor World some time ago. Now President Ralph Peters has directed that it be tried experimentally at the eastern end of the island.

Chief Engineer Savage has prepared drawings to scale for the "bumps," which are to be introduced first at some cross-road other than a macadam road in Suffolk county. The "bumps" will be 5½ inches righ, rising and falling within 8 feet. This, Chief Engineer Savage believes, will cause any driver who does not court wreck to slow down or stop. After the first "bumps" are constructed they will be tried by engineers in automobiles.

It is said that no exception will be made in the case of crossings protected by gates or flagmen.

Alfred J. Eno, of Jamaica, president of the Long Island League, who originated the "bump-the-bumps" idea is seeking permission from the city authorities to have "bumps" established on city grade crossings.

Tourists' Foreign Cars Must Pay Duty.

Because of the decision by the United States Court of Appeals, at New York, declaring that automobiles are not personal or household effects within the meaning of the tariff laws, as recorded in the Motor World last week, Assistant Secretary Reynolds, of the Treasury Department at Washington, has addressed instructions to the collectors of customs at the various ports directing that henceforth all automobiles of foreign manufacture brought to the United States shall be assessed at the full 45 per cent. duty regardless of whether or not they have been used abroad by Americans. This order is a complete change from the past practice of the Treasury Department in classifying automobiles as household effects when used abroad by the importing owner for at least one year before being brought into this country.

Suppresses the Dazzling Upward Glare.

License to make the Wridgway "No Glare" shade for automobile lamps has been given to Gray & Davis, Amesbury, Mass. The device keeps the dazzling upward rays from blinding other users of the highway. Lamp fittings of this kind have been given great importance recently through the action of New York City and other municipalities in forbidding the use of lamps that are objectionable by reason of their glare.

Digitized by Google

EVOLUTION OF AMERICAN QUALITY

Early Makers Handicapped by Lack of Proper Materials—Now on Even Terms with European Rivals.

Questions as to the relative supremacy of foreign and American built automobiles have taken on an added quota of interest within the past few weeks owing to the tariff agitation, and the revelations as to the comparative costs of production here and abroad which have followed in its train. Formerly it used to be considered a foregone conclusion that the European-made car was the standard of motor vehicle excellence, and the triumphs of the American makers were judged almost entirely on this standard. More recently, however the old assertion that the American manufacturers were able to produce as good cars as those whose factories were located on foreign soil began to assume less the aspect of a vain boast and to become an accepted reality. That the transition was due quite as much to the mastery of purely constructional difficulties as to any development of skill on the part of the designers, or to careless methods on the part of the builders, is revealed by S. I. Birdsall, whose experience as a designer and builder of American machines, as well as his intimate experience in the handling of the imported product has placed him in a position to judge accurately of conditions obtaining formerly and at the present time.

"In the early days of the automobile industry in the United States little or nothing was known of the properties required in the materials of construction," he remarks. "For example: Aluminum was a novelty; cast-iron and bronze were used for the gear-wheels of the speed-change mechanism; roller bearings having unhardened rolls operated in soft axle-tubes as a bearing for soft steel solid axles; bronze and malleable iron were used for connecting rods; the hardening and grinding of crankshafts and many other parts were unknown; brakes were lined with wood blocks; and yellow metal for bearings was 'bronze', regardless of the composition; hardening meant 'case-hardening' sometimss .001 of an inch deep, sometimes more, but always an indefinite amount.

"Heat treatment, alloy steels and hardening as we know them to-day were practically unknown. Structural steel; bar, plate and rod stock; woods of various kinds; cast iron; brass and bronze of the ordinary 'merchant' shapes and qualities were alone available for the automobile builder.

"In Europe, on the other hand, the requirements of foreign gunmakers, engine builders and others had created a demand for special steels and bronzes. From the beginning of the automobile industry in France the machines were entered in races and other competitions that developed in a few hours weaknesses and shortcomings of design in materials that would have taken months of ordinary use. Finding that increasing the size alone of a weak part to make it strong enough was not always the remedy, or even always feasible, the manufacturers naturally turned to the steel makers for better materials.

"Right here another difference between the United States and Europe should be noted. In the United States the steel makers wanted 'tonnage.' That is, they would not get out a special grade of metal and set up the rolls to shape it unless an order for many thousands of tons was placed. Whereas, in Europe, the steel mills would take an order for a few hundred pounds of a steel of special composition.

"The net result was that the French automobile builders by races that tested the materials and design of construction, by the facility and possibility of procuring proper materials, by cleverness in design and by keen competition, soon distanced all other nations in the production of cars that were reliable, fast and dependable.

"A concrete example of the above is furnished by the actual experience of one of the early American manufacturers who conceived the idea of building in this country an exact copy of a well-known and successful French car. After the first car was built the testing out proved that the American tubing used in the frame had only about one-half the strength and stiffness of the tubing used in the model. The gears would not stand up under the work and the wearing qualities and general durability of the entire machine were far below the French model. A careful investigation showed that the difference was solely due to the quality of the materials used.

"As at that time practically no one here who was available, knew the difference between the materials in the model and the copy, and there were not procurable in this country materials from a constructive and commercial point of view, that would answer the purpose, the manufacture of the car was discontinued.

"Conditions in the American engineering talent and material market have in the last three or four years completely changed. We now know what material to use in each particular place, how to use it, where to get it, and why we use it.

"It is, moreover, a fact that the reverse of the above mentioned case has happened. An American manufacturer in 1899 and 1900 produced a number of 8 horsepower cars, with single cylinder, vertical in front engine. The owner of one of these cars, appeared within the past two months at a New York salesroom and stated that he still used his little 8 horsepower original American car, and that the bearings and all of the parts had stood up wonderfully well. This car must have had excellent material and admirable design. As a matter of fact one of the largest manufacturers in Germany acquired in 1898 exclusive rights to manufacture this same car of American design and on American specifications for material. All the detailed drawings were converted into the metric system and sent to Europe with a model and some parts. The car, though well known and successful in the United States, was not satisfactory when made by the German maker with European material.

"The American industry has grown to such proportions that steel and other material manufacturers seek and cater to the wants of the automobile builder At the present time there is not, and in fact for some time past, there has not been the difference between the foreign and the domestic car that formerly existed. If the American engineer is not satisfied with American materials, all kinds and grades of foreign materials can now be procured in stock in the American market, and at prices commercially practicable.

"The only possible reason for the purchase of a foreign car in this country today is the same one that leads many people to buy English clothes and French hair-dyes. There is an idea very prevalent in some quarters that practicaly all the cars made in France, England, Italy, Germany and Belgium are as good or better that the better grades of cars made in this country, whereas the reverse is really the truth. Some of the foreign cars that have had a large sale and vogue in this country and been accepted without question as being of the highest grade were classed as second-grade at home.

"It is true that there are more builders of high-grade finely finished cars in Europe than in this country. But their combined output is not as great as the combined output of the relatively few similar makers here. On the other hand there are practically no cars built here as 'rotten' as some of the foreign ones."

Automatic Cleaner for Wind Shields.

A device for automatically keeping the transparent surface of wind shields clean and free from dew or sleet has recently been perfected by a resident of Stassfort, Magdeburg, Germany, according to American Consul Frank S. Hannah. The unusual feature of the invention consists in the substitution for the usual stationary window of an endless strip of celluloid, or some other suitable material, which is kept revolving on rollers above and below, and at the same time is pressed against a brush which removes the particles of snow or moisture which obstructs the vision. The power for keeping this strip in motion is derived from the engine.

If a crank case gets unusually hot, it is certain that the piston is letting hot gas past it, and the piston rings should be looked after. Naturally the injunction is particularly important in the case of a two-cycle motor.

The Week's Patents.

901,080. Universal Coupling. Herman Dock, Wyncote, Pa., assignor to Dock Gas Company, New York, N. Y., a Corporation of New Jersey. Filed Oct. 11, 1907. Serial No. 396,884.

1. In a universal coupling; two shaft ends, two sections, one of said sections being hinged to one shaft end the other section having a transverse guide way to receive the first-mentioned section to permit it to move laterally relatively thereto, and an anti-friction device co-operatively connecting both of said sections.

901,365. Valve Controlling Mechanism for Internal-Combustion Engines. Harry M. Neer, Columbus, Ohio. Filed Feb. 13, 1908. Serial No. 415,631.

In an internal combustion engine, the combination with a crank case, a crank shaft therein, connecting rod operating cranks on said crank shaft, piston containing cylinders, exhaust and inlet valve casings, valves in said casings and valve rods extending therefrom into said crank case, and a roller pivoted in each of said valve rods, of a shaft within the crank case rotated by the crank shaft, a pinion carried on said shaft, a gear wheel meshing with said pinion, a cam segment on the upper side of said gear wheel, and a plate supported above said gear wheel and having a depressed portion, said valve rod rollers adapted to bear on said gear wheel and its cam projection and the lower ends of said rods adapted to engage the underside of said plate.

901,371. Exhaust Muffler. John M. Porter, John F. Laird, and Albert H. Geilfuss, Parkersburg, W. Va. Filed Nov. 4, 1907. Serial No. 400,694.

1. A muffler of the character described comprising two plates or sides, a series of cells arranged on each of said plates, each inclosing cell being of a greater height and of a larger diameter than the cell inclosed thereby, means for allowing the exhaust to pass from each inclosed cell to each inclosing cell, and a rod passing through the muffler in engagement with each of said cells for securely tying the same in position upon the said plates, substantially as described.

901,456. Variable Speed Gearing. Achille Loithon, Plaine St. Denis, France. Filed Aug. 7, 1907. Serial No. 387,493.

Variable speed gearing comprising a shaft two series of toothed wheels of progressive diameter, one series being loosely mounted upon the shaft, coupling clutches for coupling the loose toothed wheels with the shaft, forks for operating said clutches having two arms, a pin connecting the ends of the three arms, spiral springs upon said pin between each lateral arm and the guide arm, a connecting rod, connecting the forks of two adjacent clutches being slotted to permit a certain play to the forks and an operating shaft for the forks having guide grooves for the guide arms of said forks substantially as described and shown and for the purpose set forth.

901,493. Automobile. Frank A. Stephens, Dunkirk, N. Y. Filed Dec. 9, 1904. Serial No. 236,148.

1. In an automobile, the combination with the driving axle thereof, of a plurality of engines, a gasolene engine adapted to run at uniform speed, and an atmospheric engine adapted to be driven at differing speeds and connected directly to the driving axle of the automobile, an air pump for supplying compressed air to the atmospheric engine and friction mechanism operatively connecting the air pump to the gasolene engine and comprising a clutch member on the shaft of the gasolene engine, an eccentric loosely mounted on said gasolene engine shaft in proximity to said clutch member, an eccentric rod having one end pivoted to the air pump and its opposite end secured to the strap and a collar forming the other clutch member, substantially as set forth.

901,508. Controlling Mechanism for Power-Driven Vehicles. Charles W. Willette, Tacoma, Wash., assignor of one-half to Julian Clough, Tacoma, Wash. Filed Dec. 27, 1907. Serial No. 408,239.

1. In a power driven vehicle, the combination of a rotating shaft, a movable bearing for the shaft; an outer fixed sleeve for said movable bearing, allowing a longitudinal motion thereof therein; a thrust shoulder on each side of said shaft bearing, whereby said shaft moves along its axis with the bearing; and means for moving said bearing along its axis.

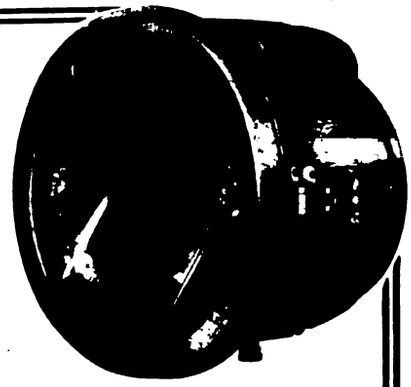
901,518. Planetary Gearing. Alanson P. Brush, Detroit, Mich. Filed July 3, 1907. Serial No. 381,970.

1. In planetary gearing, the combination of a power shaft having a crank pin, an external gear mounted on said crank pin, a driven member, an internal gear fast to said driven member in mesh with said external gear, and means for locking said external gear to the power shaft.

902,551. Tire Jacket for Vehicle Wheels.

Anyone can operate a Westinghouse Mercury Rectifier Battery Charging Outfit.

It is economical and easy to install, requiring only a small floor space. It is exceptionally flexible and reliable in operation and offers a ready means of automatically converting alternating into direct current without the use of any moving machinery.



Exhibited at leading automobile shows this year and for sale by all electrical vehicle manufacturers.

Folder 4105 for particulars.

The Warner Auto-Meter

1909 Style

Guaranteed Absolutely Accurate

is the only speed indicator made on the Magnetic Induction principle. Because of the principle it accurately indicates every range of speed from zero to the maximum.

All other instruments are made on the centrifugal principle. They fail to indicate any speed whatever under 5 to 10 miles per hour.

The Auto-Meter is so durably made that practical tests have shown that it will endure a **MILLION MILES** of riding without perceptible wear, or departing from absolute accuracy more than **10 feet to the mile.**

We invite comparative tests. Before you decide on any Speed Indicator, put the Auto-Meter on one side of your dash and any other indicator at any price on the other. Then use your watch over a measured course. Keep the instrument which **tells** the **truth.** We know which it will be.

MILLER'S Anti-Freeze Compound

DIRECTIONS FOR USE.

The radiator should be thoroughly washed out with hot solution of caustic soda, which will remove any dirt, and then clean water should be put in to see if the radiator leaks any place.

If the radiator is found not to leak, put in the solution. To get a mixture that will not freeze at 15 degrees below zero, Fahrenheit, add ten pounds of the compound to two gallons of water. To get a solution that will not freeze 30 degrees below zero, Fahrenheit, add ten pounds of the compound to every six quarts of water.

The cover on the can should be kept closed tight at all times while it contains any of the compound.

Price, 10-lb. cans..... $1.00 each.

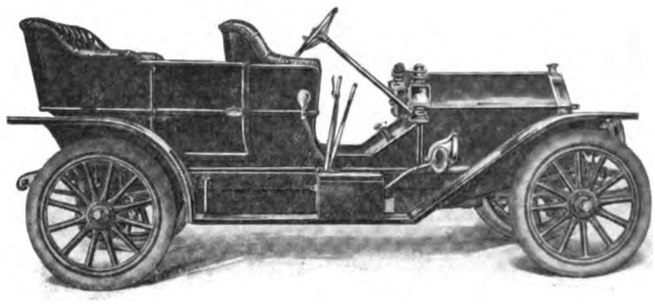
Pan-American Automobile Body Polish

Pan-American Polish was awarded the Bronze Medal ("the only one awarded") at the Louisiana Purchase Exposition at St. Louis, 1904. This polish has been carefully prepared for the Automobile trade. It is also applicable to the carriage trade, or can be used on any varnished furniture or wood-work of any kind. It will remove stains, cover scratches; leaves the automobile with its original new lustre without being sticky or greasy.

It can be used on the leather seats or tops with the very best results. Can be used on any color or kind of varnish from the clearest white to the darkest black. Furnished in eight-ounce bottles.

For sale by all automobile dealers.

Price, 60 cents per 8-oz. bottle. Price, $3.00 per gallon.



Special prices quoted manufacturers, jobbers and dealers. Catalog on request.

The Largest Automobile Supply House in America

INTER-STATE TOURING CAR, $1,750.

The Inter-State

THERE is speed, comfort and safety in every INTER-STATE Car—the permanent, enduring car at a price but little higher than the price of temporary, make-shift cars.

The INTER-STATE motor is of the most efficient type—four-cylinder, 4¼x5—water cooled, with extra large water jacket spaces—cylinders cast in pairs—valves located in pockets on the right side of the motor and all mechanically operated from the same cam shaft. The motor is of 35-40 horsepower and drives the car at from 5 to 60 miles an hour on high speed. Speed enough for anybody.

INTER-STATE comfort is assured by 40-inch full elliptic scroll springs in the rear and 42-inch semi-elliptic springs in front, all of best steel—large whees, 34-inch artillery, fitted with 4-inch tires.

Extremely careful construction and perfect control give the INTER-STATE greatest safety—Frame is pressed from special stock cold rolled steel, thoroughly braced. Front axle, "I" beam drop forged in one piece—Rear Axle, reliable semi-floating type with large axle shafts—Four brakes 12 inches in diameter on rear hubs, internal expanding and external contracting, lined with camel's hair.

The highest standard of quality is maintained in every detail of the INTER-STATE and at $1,750 the INTER-STATE—with Eisemann Magneto—is the biggest value on the 1909 market.

AT THE CHICAGO SHOW—The full line of INTER-STATE Automobiles—Standard Touring Car, Demi-Tonneau, Double Rumble Roadster, Single Rumble Roadster, and Tourabout—will be exhibited at the Coliseum, Chicago, Feb. 6-13.

There Is No Guess Work About Expenses When You Use

AJAX TIRES and TAXIMETERS

You get a 5,000-mile written guarantee with Ajax Tires—a guarantee that assures you of at least 5,000 miles of service from each tire. One that enables you to figure out exactly your tire expense. One that reduces the upkeep cost on taxicabs to the lowest possible figure. Ajax Tires are economic tires because they last longer and do not have to be changed so often. In purchasing them you take nothing for granted, the guarantee does the talking.

After thoroughly testing their merit, we have taken over the exclusive leasing rights for NATIONAL TAXIMETERS, manufactured by the National Taximeter Co. of N. J. They record the tariff from each trip, the baggage charges, daily receipts, number of trips, total number of miles run and distance run when not recording. They have a special means of non-recording for delays occasioned by repairs. Write for our special proposition if cars are equipped with Ajax Tires.

Should be on your car

The Standard of the World

Not an accessory—but a proven necessity. Should be as much a part of your car as its springs or tires.

For argument's sake, suppose that Truffault-Hartford Shock Absorbers had not been an integral part of every car in every great International Road Race, Glidden Tour or Endurance Contest.

Suppose that twenty prominent manufacturers did not make the Truffault-Hartford a part of their standard equipment, then if we showed you letters from men who have used the

TRUFFAULT-HARTFORD SHOCK ABSORBER

and these men told you that broken springs were unknown, that all troubles due to vibration, jar and jolt were eliminated and that their cars ran smoothly at high speed on roads that, without Truffault-Hartford Shock Absorbers would be impossible,—if we did this,—you would equip your car, wouldn't you?

WE CAN DO THIS—we have just such letters and proofs from hundreds of satisfied owners that the Truffault-Hartford Shock Absorber does more than we claim. Then consider that twenty prominent manufacturers do make the Truffault-Hartford **part** of their car,—that's the best proof we know that they should be on <u>your</u> car.

Tell us the make, model and year of your car and let us arrange to equip it with these "life-savers." At any rate, send for our catalogue and other literature, now—today.

Stearns

GOOD design; a careful selection of scientifically tested materials; the exercise of greatest care in the manufacture of component parts; painstaking skill in their assembly, and a system of final inspection so comprehensive and complete that anything under 100 per cent. perfect cannot get through—that's Stearns production.

¶ Our new 15-30 is for those who would have a strictly high quality car at price and of power somewhat under the 30-60 horsepower model.

¶ Catalogued at 15-30 it develops close to 40 horsepower and, while of comparative light weight, is so staunch and sturdy that it will "stand up," as a good car should, even under unusual conditions of service.

¶ And, like our 30-60 (which is accepted as the standard of excellence in America), this new 15-30 model represents extreme high quality in every line and fiber.

¶ It is shaft drive, and designed to accommodate town and touring bodies.

¶ In our 30-60 horsepower model purchasers are given side chain or shaft drive option.

¶ Demonstration by appointment.

Proclamation!

TO TRUCK OWNERS EVERYWHERE

THREE years ago when we applied the first Dual Side-Wire tire in America, we believed that we were introducing the newest and best thing obtainable in the shape of a MOTOR TIRE. And we were—the best thing up to that time. But times change; and we pride ourselves on trying to keep abreast of them. Careful study and observation of the solid tire situation abroad, have firmly convinced us that the side wire tire is now a back number and must graciously step aside for the newer and better product.

WE accordingly beg to announce that we are now manufacturing a NEW tire, which for service, security and resiliency, completely eclipses the side wire type. It is the

Gibney Wireless Motor Tire

CROSS SECTION—DUAL TYPE

THIS is not an untried experiment. These tires have been the standard of Continental Europe for the past five years. They have triumphed abroad; they will make good here.

This Tire Will Give You The Best Service

There may be other tires on the market that probably look from outside appearance to be as good as the G & J, but if you will get sections of the different tires and compare the quality of rubber, its toughness, and the manner in which it is embedded into the meshes of the fabric you will note there is a difference. After making this comparison and also noting carefully the general construction, you will not wonder why so many are specifying G & J Tires.

THE SELDEN CAR

MADE BY

"The Father of Them All"

One Price, $2,000. F. O. B. Rochester.

TOURING OAR, ROADSTER, TOY TONNEAU

A genuinely good car cannot be made and sold for less than $2,000. By this we mean a car like the Selden, containing nothing but the best of materials, workmanship and finish. A car that the manufacturer can stand behind and guarantee for at least a year against any imperfections in workmanship or material.

We buy only the best materials, employ only skilled labor and pay particular attention to details and finish, thereby producing a strictly high-grade car at the lowest possible price.

The up-keep and maintenance of a medium-priced car like the Selden is within the reach of any man of moderate means and the value of the car does not depreciate like that of the lower priced cars. This is the point to be considered by every purchaser.

The Selden Car is a 4-cylinder 28-30 horsepower (developing 37 horsepower) five passenger Touring Car or three passenger Roadster, with 114-inch wheel base, 34-inch wheels, shaft drive, selective control, pressed steel frame, metal body, fully equipped.

Superb riding, roomy tonneau, luxurious upholstery, smooth running, great hill-climber, flexible and easily handled, economical in maintenance and up-keep, fine finish, stylish and attractive.

INTER-STATE TOURING CAR,
$1750

There is speed, comfort and safety in every INTER-STATE Car—the permanent, enduring car at a price but little higher than the price of temporary, make-shift cars.

The Inter-State

THE INTER-STATE motor is of the most **efficient type**—four-cylinder, 4¼ x 5—water cooled, **with extra** large water jacket spaces—cylinders cast **in pairs**—valves located in pockets on the right side of the motor and all mechanically operated from the **same cam shaft.** The motor is of 35-40 horsepower and drives the car at from 5 to 60 miles an hour on high gear. **Speed enough** for anybody.

INTER-STATE comfort is assured by **40-inch full elliptic** scroll springs in the rear and 42-inch semi-elliptic springs in front, all of best steel—large **wheels, 34-inch** artillery, fitted with 4-inch tires.

Extremely careful construction **and perfect control** give the INTER-STATE greatest safety. Frame is pressed from special stock cold rolled **steel, thoroughly braced.** Front axle, "I" beam drop forged in **one piece.** Rear axle, reliable semi-floating type **with large axle shafts.** Four brakes 12 inches in diameter on rear hubs, internal expanding and external contracting, lined **with camel's hair.**

The highest standard of quality is maintained **in every** detail of the INTER-STATE and at $1750 the INTER-STATE complete—with **Eisemann Magneto—is the biggest** value on the 1909 market.

At the Chicago Show—The full line of INTER-STATE Automobiles—Standard Touring Car Demi-Tonneau. Double Rumble Roadster, Single Rumble Roadster, **and** Tourabout—will be exhibited at the Coliseum, Chicago, Feb. 6-13.

You—Who Use Auto Tires

—You—who want the BEST, but are in doubt
—You—who are "from Missouri" and must be shown
—You—who prefer proofs to conversation

LISTEN:

Eight Hundred of the Thousand Taxicabs in New York City—and owned by several competing companies—have contracted for **Goodyear Tires to be used exclusively.**

Because, in actual **mileage shown** by evidence of the Taximeter, and by **minimum of trouble and repairs** as shown by the "trouble sheets"—Goodyear Tires cost **AWAY LESS PER MILE** than any one of the dozens of other makes tested in competition.

—And the same is true of the Taxicabs of all the large Eastern cities. **Eight out of ten** are using Goodyear Tires exclusively.

Now—the Climax

At the A. M. C. M. A. Show were 160 American cars, equipped with the pneumatic tires of 13 different makers.

If evenly distributed, each tire manufacturer would have equipped **8% of the cars.**

Now note this—

16% of these cars were equipped with Goodyear Tires—DOUBLE THE NORMAL PROPORTION.

Why?

Pure, unadulterated **GOODNESS** was responsible—not price—for Goodyear Tires cost a little more than most tires on the market—**for a reason.**

And Still Another Climax

You know all about Quick Detachable Rims—how they make fixing a puncture or changing tires an easy job—if the Rims themselves are **RIGHT** and **STAY SO.**

Goodyear Quick Detachable Rims are simplest, safest, sturdiest—the **only** rims that can be taken off and put back without **special tools.** We have proved this conclusively wherever we could get a motorist to listen.

Here's Further Proof

Goodyear Quick Detachable Rims were used on 51% of the American cars on which Detachable Rims of ANY KIND were used.

Which means that more **Goodyear** Quick Detachable Rims were used than **all other quick detachable rims COMBINED**

* * * *

It goes without saying that this Goodyear Landslide—on both Tires and Quick Detachable Rims—was not **ACCIDENTAL.**

There's an interesting story behind it all—of repair bills reduced—of tires making 15,000 to 20,000 miles each—of tire troubles of all kinds cut down, until those who insist on Goodyear equipment always start on a trip with confidence and return rejoicing.

It's a story you ought to hear in full.

Write for our helpful book, "How to Select an Auto-Tire," or call in at our nearest Branch Store. We'd like to tell the story to you by letter or in person. It will teach you how to save money and trouble.

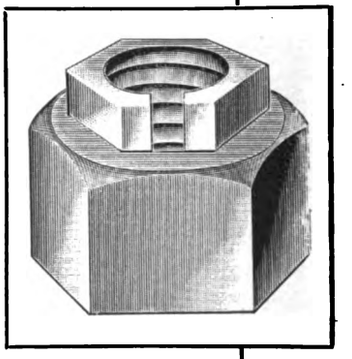
"Locking the door after the pony is stolen"



is a good deal like postponing the use of

Columbia Lock Nuts

Now

for it's only a postponement at best. Why not take a double-twist on the forelock of old Father Time and incorporate the use of Columbia Lock Nuts in your construction BEFORE you have occasion for regrets? Columbia Lock Nuts are in general use and are regarded as a necessity by some of the biggest railroad systems in the country. They ought to be a double necessity on automobiles. They are already used by many prominent makers. They should be used on every automobile everywhere.

¶ Columbia Lock Nuts simply cannot work loose. Vibration, even the constant vibration of solid tires, cannot affect or loosen them. They are automobile insurance of the very best kind and their cost is not a factor. Let us prove our case.

Why The Remy Magneto Is The Highest Grade Ignition System For American Motor Cars

American ingenuity has so simplified the design of ignition Magnetos that the highest grade product obtainable, particularly for American cars, is the American product.

The Remy 1909 High Tension Magneto easily proves this claim. Compare the Remy with any foreign product.

It has larger margins in its construction, electrically and mechanically, and does not have any delicate or sensitively adjusted parts.

It provides for a double ignition system, consisting of both Magneto and battery, in the simplest possible way, not requiring additional wiring of any kind, as do all imported Magnetos where double ignition is used.

What quality for satisfactory results has the imported Magneto that the Remy has not?

On the other hand, the Remy alone has the broad margin so necessary to ignition equipment of a car used in America, for neglect, abuse, oil, water, dirt, etc.

The Remy gives steady, dependable service, where the best of the delicately constructed, sensitively adjusted foreign Magnetos fail.

Simplicity is not only desirable—it is essential in ignition for use on American roads.

Magnetos from over the sea may give service when installed at the foreign factory—when constantly cared for by specially trained mechanicians, thoroughly familiar with their complications—and when used on the fine highways of Europe.

But the big majority of motorists in America cannot have the imported Magneto under any such favorable circumstances.

Remy

See It at The Chicago Show

The American motorist needs an ignition system that he or his chauffeur can understand—a system that doesn't get out of order—one that insures positive firing under any and all conditions—in the muddy country road—the rugged hill climb—the long tour far away from the garage or the protecting care of the expert.

THAT'S THE REMY.

Not a detail is slighted in Remy construction to make it the highest grade and most dependable Magneto equipment possible.

Yet the Remy can be sold for a lower price than foreign Magnetos.

This is due in part to the heavy duty on the imported Magneto. When you buy an imported Magneto, you pay the duty. Our lower price is also due to the better manufacturing methods in America. The highest class of work, and the more rapid work is done here.

More Remy Magnetos than all others—foreign and American combined—are in actual use on American cars.

More Remy Magnetos have been sold for this season than all others combined.

To date more than 20,000 Remy Magnetos have been contracted for on minimum specified deliveries for 1909 cars.

We are the oldest builders of High Tension Magnetos in the world.

The Remy Magnetos are used on the highest priced American cars, and also on the popular small runabouts.

There has never been a failure on the part of the Remy Magneto in a single racing event, hill climbing contest or endurance contest of any kind, to our knowledge.

In the recent Savannah Automobile Races the Remy Magneto took the place of imported Magnetos which had broken down, and gave perfect results.

Write us for illustration and full description of our new High Tension Magneto. We build Magnetos in such large quantities that we can make you very attractive prices.

THE MEASURE OF TIRE QUALITY

is not alone length of service, but also kind of service.

A tire that has to be coaxed by frequent visits to a repair shop is an inferior tire, even tho it may last a total of three, five or seven thousand miles.

MORGAN & WRIGHT TIRES

are long-lived tires, but the length of service is secured in the making of the tires, and and not by frequent doctoring by the users. They stand up as only tires can that are made as Morgan & Wright tires are. And our rigid system of inspection protects you from any and all possible defects.

MORGAN & WRIGHT, Detroit

THE MARMON

"A Mechanical Masterpiece"

The "Thirty-Two" Roadster, $2400

Proven, Not Prophesied

The sterling merit of Marmon construction, the durability of Marmon cars, and the reliability of Marmon service are well known throughout American motordom.

With these vital attributes carefully built in—not left to chance in mere assembling—the Marmon "Thirty-two" presents a notable value to the thoughtful buyer. Light, powerful, and embodying all the known best things in design and equipment, it invites the most critical comparison with anything on wheels at $3,500 or less.

Motor, 4 Cyl. 4½x4½. Water-cooled. 32-40 H. P. Three-point support. Ignition, Bosch H. T. Magneto, dual system. Lubrication, Marmon system of automatic force feed through hollow crankshaft. Drive, straight line shaft. Selective transmission and rear axle one compact unit, very accessible. Large brakes, effective and very durable. Materials, absolutely the best of everything, including Krupp and Chrome Nickel Steels. Hess-Bright imported ball bearings. Tires, Q. D.,34x4. Wheel base, 112 in. Weight, 2100 lbs. Equipment, complete and high-class. Bodies, Sheet Metal. Touring Car seats five; Suburban (detachable tonneau) seats four; Roadster seats two. Also Coupe or Limousine Town Car.

Marmon "Fifty" (Seven Passengers), $3,750.

Nordyke & Marmon Co. (Estab. 1851) Indianapolis, Ind.

Standard Mfrs. A. M. C. M. A.

At Chicago Show, February 6-13.

The Easiest Riding Car In The World

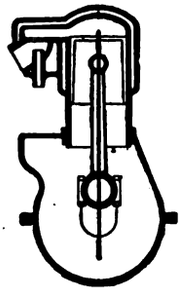
Rambler

The Car with the Offset Crank Shaft

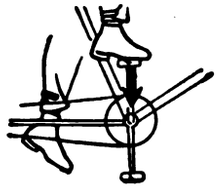
Model Forty-four, 34 H. P., $2,250

Spare Wheel, with inflated tire, brackets, and tools, $74.
Magneto, $150.



Why the Offset Crank-Shaft?

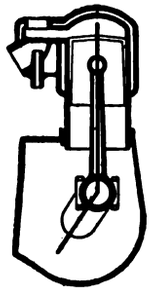
Notice a man about to mount a bicycle. He always adjusts the pedal in that position where it will receive to best advantage his full weight on the first downward stroke. This position for the pedal is just slightly forward of the center of the crank-shaft of the bicycle. If he mounted when the pedal was directly over the center of the crank-shaft, his weight would fall directly on the bearings and the first downward stroke would be retarded and therefore weak.



Now imagine the man's leg as the piston of an automobile engine, the pedal of the bicycle as the crank-pin, and the crank-shaft of the bicycle as the crank-shaft of the engine. In the ordinary engine the crank-pin and piston (the pedal and the man's leg) are directly over the dead center, and until the crank passes the turning point all effort is wasted. Thus when the explosion occurs the greatest force falls upon the bearings.

In the Rambler engine, at the instant the explosion occurs above the piston the crank-pin has moved past the dead center; the crank-shaft is in a position to receive the full pressure and turns without friction. No shock falls on the bearings; there is no side thrust, and wear on the cylinder walls is thus saved.

Because of this feature Rambler Model Forty-four can be operated smoothly and steadily at three miles an hour on high gear



Ordinary Engine. Position of piston at explosion center.

Corresponds to position of piston in ordinary engine at explosion center.

Corresponds to position of piston in Rambler engine at explosion center.

Rambler Offset Crank-Shaft. Position of piston at explosion center.

Seven-passenger model, 45 horsepower, with offset crank-shaft, $2,500. Other models $1,150 to $2,500. A new Rambler catalog has just been issued. It describes and illustrates all distinctive features of new Ramblers--the offset crank-shaft, Spare Wheel, straight-line drive, etc. A copy on request.

THE CAR OF STEADY SERVICE

THE MOTOR WORLD

Volume XIX. New York, U. S. A., Thursday, February 4, 1909. No. 19

RAINIER PLANS FOR NEW START

Buys the Company's Name and Properties at Receivers' Auction—Will Resume Production at Early Date.

John T. Rainier, through his attorney, George C. Comstock, has bought the Rainier Motor Car Co., of New York City and Saginaw, Mich., from the receivers, into whose hands the concern was delivered last November as the result of a petition in bankruptcy. After several unsuccessful efforts on the part of the receivers to obtain what they considered a proper price, the assets of the company were put up at auction sale in New York City on the 26th ult., and Comstock, acting for Rainier and his associates, bid $20,000 for the property in Saginaw not covered by mortgage, the company's equity in the mortgaged property, and all the property in New York, including the firm name and the good will.

"We bought the company as a going concern," explained Rainier, when asked by the Motor World as to the purchase, "and we propose to act promptly and take advantage of the spring trade. It is the intention to have the factory at Saginaw operating as soon as possible and to have the new Rainier models out and on the market at the earliest possible date."

Steps have been taken to arrange an adjustment of all the various difficulties attending the fulfilling of the terms of the bond mortgage on the plant, the claims of the various creditors and the conditions imposed by the merchants' association in Saginaw when the site for the plant was given over to the company originally. It is probable that a slight change in the corporate title may be made necessary when the complete reorganization is effected, but the established value of the Rainier name is to be carefully conserved.

At the factory all the necessary parts for 35 cars are reported to be immediately available, while a large stock of extra parts will assist in the work of prompt production when actual manufacturing is resumed. The Saginaw interests give evidence of a desire to co-operate in the bringing of the plant into activity again and when the necessary court approval and orders have been obtained, work will commence in earnest.

Detroit Company to Move to Elwood.

Through the efforts of a business men's organization in Elwood, Ind., known as the factory fund committee, the Detroit Auto Truck Co., of Detroit, Mich., will move its plant to Elwood and will occupy the west building of the Pittsburg Plate Glass Co., which was bought by the business men's association for $15,000. By the terms of the agreement the plant must be put in productive operation by the first of May.

Seeks to Bar Recharging Gas Tanks.

Action has been brought against George L. Wilkinson, of Manchester, and Noyes B. A. Carrier, of East Hampton, Conn., by the Prest-O-Lite Co., of Indianapolis, Ind., seeking to enjoin them from recharging the company's tanks with acetylene gas. The defendants have been ordered to appear before Judge James P. Platt in the circuit court of the United States, on Wednesday, February 16, at Hartford.

Stearns to Manage Lockport Factory.

W. F. Stearns, who has had wide experience in the tire making field, has become identified with the Lockport Rubber Works, of Lockport, N. Y., in a financial way, and has taken the position of factory manager. He will have full charge of the manufacturing of the Lockport tire and other products.

Brown-Lipe to Add Complete Axles.

Complete axles are to be added to the products of the Brown-Lipe Gear Co., of Syracuse, N. Y., according to information which has recently leaked out. The company is one of the pioneers in the manufacture of differentials, change gear mechanisms, steering outfits and the like.

RECRUITS FROM CARRIAGE TRADE

More Big Makers of Horse Drawn Vehicles Preparing to Adopt the Motor—Plans for Experimental Outputs.

Like jumping sheep flocking to a new pasture, the makers of horse drawn buggies and carriages are hastening to take up the manufacture of motor vehicles, and the firms in the automobile trade who are able to supply motors and parts are being confronted with lines of customers representing in many cases some of the most prominent buggy and carriage concerns in the country. Among the prominent firms of this class that are making experiments with modest preliminary outputs in preparation for larger subsequent production, are the Fuller Buggy Co., of Jackson, Mich., which is planning to turn out 500 machines of the buggy type; the Jackson Buggy Co., of the same city, which is buying parts and materials for 25 cars; the Jewel Carriage Co., of Carthage, O., which has ordered 125 sets of parts for a four cylinder car; and the W. A. Patterson Co., one of the big companies in Flint, Mich., which is getting ready to manufacture motor buggies on a large scale.

Quotations on automobile material are also being asked for by the Flint Wagon Works, Flint, Mich., and by such concerns as the Richmond Mfg. Co., which was formerly the Richmond-Indiana Mfg. Co., of Richmond, Ind.; by the Parry Mfg. Co., Indianapolis, Ind., which is now making automobile wheels; and by the Criterion Motor Car Co., of Kent, O., each representing interests identified with the manufacture of horse drawn vehicles.

All of these concerns are recent converts, to be added to the already extensive list of buggy and carriage makers who have been in the field of motor vehicle manufacture for some time. Supplementing these later important recruits, the smaller experimenters, including blacksmiths and wagon builders,

Digitized by Google

may be numbered by the hundreds. According to the purveyors of automobile parts, the rush of business from the buggy, wagon and carriage trade indicates a movement almost amounting to an invasion or a "landslide," though highly competitive and not at all concerted so far as its individual components are involved.

Presenting the carriage makers' view of the situation, R. D. Nibert, secretary of the Carriage Makers' Club of Cincinnati, told a reporter that according to the reports received by the club, the automobile has made important inroads into the carriage and buggy industry in the East, especially in the case of some of the factories that have been turning out the higher priced, fancy carriages, although the Western market for light, medium priced vehicles had not as yet been seriously affected.

"But I understand," Nibert continued, "that a number of carriage makers are contemplating the reconstruction of their factories into plants for the manufacture of low-priced automobiles. We rather expect the automobile industry to develop and grow along the lines of the bicycle industry. At the outset bicycles were very costly, but in time, as they became more and more popular and the demand for them grew and the factories for their manufacture multiplied, they became so cheap that everybody could have one. The automobile industry is likely to undergo the same stages of evolution. In contemplation of that sort of development, the carriage makers are on the alert, and their plans will unfold logically and reasonably."

France Raises Duty on Carbide.

Because the Bullier patent on the manufacture of calcium carbide expires in France on February 9, the French interests have obtained a raising of the import duty for that country. Hereafter instead of 5 per cent ad valorem, the duty on calcium carbide imported into France will be 6 and 9 francs per 100 kilos. ($1.16 and $1.74 per 220 pounds) under the general and minimum tariffs, respectively. Carbide imports from the United States are subject to duty under the general tariff.

Franklin Stockholders Elect.

At the annual stockholders' meeting of the H. H. Franklin Mfg. Co., Syracuse, N. Y., held January 27, H. H. Franklin was re-elected president and Giles H. Stillwell vice-president, while F. A. Barton was chosen secretary and treasurer. The following were re-elected directors: H. H. Franklin, S. H. Dann John Wilkinson, G. H. Stillwell, A. T. Brown, W. C. Lipe, and F. A. Barton.

Creet to be a Maxwell Manager

R. A. Creet has been appointed manager of the new branch which the Maxwell-Briscoe Motor Co. is to establish in Chicago. The branch will take over the business at present held by a local agent.

IMPORTS STEADILY SLUMPING

Remaining Strength Due to Introduction of Taximeter Cabs—Surprises of the Year's Figures.

Rapid decline in the value of the imports of foreign cars into the United States is shown by the returns for the year ending with December, 1908, and the extent of the slump is most apparent in the comparison of the year's total with that of 1906, the comparison showing a falling off amounting to almost $2,000,000. Oddly enough, the number of foreign cars imported during the past year was greater than in either 1906 or 1907, but so large a proportion of the more recent importations were low priced vehicles for commercial purposes, as to account for the phenomenon.

It is shown that 1,347 cars were brought in during the twelve months of 1908, as against 1,093 in 1907, and 1,295 during 1906. In 1906 the total imports of cars amounted to $4,416,048 and of parts $494,160. The returns for 1907 indicated for cars a total of $3,157,168 and of parts $650,403, while in 1908 the return is only $2,558,819 in cars and $650,563 in parts.

As might be expected, France shows the largest shipments to the United States, followed by Italy. Contrary to general impression, however, the United Kingdom sent more cars and more value in cars to the United States than did Germany at any time during the past three years. These four divisions were the chief sources of the imports, the others being grouped in the official figures as "Other countries."

The record reveals France as having sent over cars in 1906 to the number of 942, having a value of $3,225,507; in 1907 the cars numbered 835, valued at $2,317,843; and in 1908 the cars reached 947 in number but were valued at only $1,708,474.

Italy alone shows a gain in both number and value for the three years. In 1906 its cars brought in numbered 138, valued at $405,587; in 1907 the cars numbered 91, valued at $259,052; and in 1908 the number of cars was 271, valued at $524,653.

The United Kingdom's showing for the three years was 97 cars in 1906, valued at $349,984; in 1907, cars to the number of 91, valued at $298,629; and in 1908 only 77 cars, valued at $167,412. Germany's contribution in 1906 was 74 cars, $318,001; in 1907, cars to the number of 53, valued at $210,756; and but 32 cars in 1908, valued at $99,394. The group known as "Other countries" sent 44 cars, 23 cars and 20 cars in the three years, respectively, of which the values were $116,969 in 1906; $70,888 in 1907; and $58,886 in 1908.

The changed character of the import business is due to the fact that the importation of pleasure cars has dwindled mightily, while the taximeter cab importation has increased, owing to the activities of the operating companies in New York City and elsewhere. The record of the port of New York gives an illuminating analysis of the character of the importations of the year.

Following is a statement of cars imported into New York during the calendar year ending Dec 31, 1908:

	—By Individuals—		—By Dealers—		
Make—	Old. 2d imp.	New. In use.	Trucks.	New.	Total.
Fiat	15	6	..	157	181
Panhard	20	14	3	35	72

Miscellaneous	8	4	..	6	18
Total	151	144	19	533	1,416

For the calendar year of 1908 there entered at the port of New York 1,416 foreign automobiles, of which number:

Pleasure vehicles to dealers	533
Taxicabs	553
Trucks and buses	19
Cars in bond	16
New cars in use imported by individuals	144
Old and second-hand cars reimported.	151
Total	1,416

Imported in bond—Fiat, 3; Renault, 4; Itala, 3; Benz, 4; Del. Bel., 1; Motobloc, 1; total, 16.

Taxicabs imported—Renault, 64; Del. Bel., 1; C. G. V., 3; Clement, 1; Delahaye, 62; De Dion, 1; Darracq, 412; Aries, 1; Argyll, 1; total, 553.

Flames Consume the Comet.

The Comet Motor Co., of Montreal, on January 28 suffered a fire loss of $130,000. The conflagration destroyed the company's factory and warehouse together with forty completed automobiles.

YEAR'S RECORD OF EXPORT TRADE

Almost $5,000,000 in American Cars and Parts Shipped to Foreign Countries—Europe Buys Freely.

With the completion of the year 1908, a view of the export activities for the twelve months is presented which shows shipments of American cars to foreign countries amounting to $4,346,293, which, while not quite as great as during 1907, is in excess of the volume of this business done in 1906. The same holds true of the parts exported, these amounting to $602,301, making with cars, a total exportation to the value of $4,948,594.

Biggest customer of all is the United Kingdom, whose purchases of American cars during the twelve months of 1908 came to $1,728,704, making a favorable comparison with the $1,738,488 in 1907 and the $1,138,264 in 1906. British North America is second on the list, with $1,115,540, as compared with $1,167,355 in 1907, and $878,885 in 1906.

France bought American cars to the value of $560,449 during the year just passed, although this total was not quite as great as during 1907, when the amount was $596,450. It is much larger, however, than the $336,273 of 1906.

Mexico continues as a good customer, being fourth, in spite of the fact that its buying has fallen off over 50 per cent. since 1906. Germany and Italy are not at all self-sufficient, so far as automobile production is concerned and are steady purchasers of the American product. Three of the fourteen divisions show gains for the year, these being Other Asia and Oceanic, Africa, and Other Countries.

Together with France and British North America, these three divisions also represent those who have made a gain for the month of December, the remaining divisions recording various losses. The record in detail follows:

	1907	1908	1906	1907	1908
Automobiles and parts of—					
Automobiles and parts of	.....	.....	*$2,356,110	.....	.....

Issues Handbook of Licensed Cars.

Illustrating and describing the principal models of its members, the sixth annual edition of the handbook of gasolene automobiles issued by the Association of Licensed Automobile Manufacturers is now ready for trade and public distribution. An innovation is a page giving in tabular form the horsepower ratings of the various sized motors according to the A. L. A. M. formula. The handbook is sent from the Association's offices, No. 7 East Forty-second street, New York City on receipt of 6 cents to defray postage.

Overland Opening Western Branches.

With an eye to the rapidly increasing Southwestern trade, the Overland Automobile Co., of Indianapolis, Ind., has opened a distribution branch for Overland cars at Dallas, Tex., to be known as the Overland Automobile Sales Co. It will be in charge of Manager Funk, formerly of the Oklahoma Motor Car Co., Oklahoma City, Okla. The company also is operating a direct factory branch at 1413 Michigan avenue, Chicago under the management of Charles Price, assisted by F. E. Wilson.

Announces a Change of Lines.

The American Distributing Co., of Cleveland, O., has discontinued the sale of the product of the Long-Arm System Co., and will shortly announce a new connection. The sale of the Imperial Wheel Co.'s product has likewise been discontinued, the American company now having control of the output of the Hayes Wheel Co., of Jackson, Mich.

Owen Joins the Fickling Staff.

Wally Owen, one of the best known automobile men in the Metropolis, has joined the staff of Fickling & Co., 304-6 West Forty-ninth street, New York City. He will have charge of the second hand department which is to be opened as a clearing house for various automabile firms in New York.

NEW JERSEY DECLARES THEM DEAD

State Extinguishes the Corporate Life of Many Abandoned Automobile Projects—List of the Defunct.

Once a year the State of New Jersey wipes out a number of corporations which have been created under its laws, but which, by their failure to pay up their annual state taxes for the two years preceding, give evidence of having given up the ghost. The crop of "dead ones" with unpaid taxes for 1906, this year includes many concerns at one time either in or of the automobile trade. Among those to be repealed and concerning which all powers conferred by law have been declared inoperative and void are the following: Adams Storage Battery Co., American Darracq Automobile Co., Austin Automobile Co., Auto Leather Co., Beacon Automobile Co., Breeze Motor Mfg. Co., Century Auto Power Co., Commercial Electric Vehicle Co., Commercial Motor Co., Commercial Motor Vehicle Co., Fischer Motor Vehicle Co., Foye Hub-Motor and Automobile Co., Hub Motor Co., Hyne Motor Co., Inter-City Automobile Speed-Way Co., Manhattan Motor and Launch Co., Motor Construction Co., Moto Tractor Company of America, Prescott Automobile Mfg. Co., Reo Automobile Co., Standard Storage Battery Co., United Motor and Vehicle Co.; United Motor Car Co.

Bartholomew Elects Its Officers.

The annual election of the Bartholomew Co., Peoria, Ill., was held on January 20. It resulted in the re-election of the officers and the board of directors complete. The officers are are follows. J. B. Bartholomew, president; A. Y. Bartholomew, vice-president; O. Y. Bartholomew, treasurer; G. G. Luthy, secretary.

New Tires to Emanate from Newark.

The United and Globe Rubber Manufacturing Co., of Newark, N. J., has entered the field of automobile tire manufacture. Experimental tires of various types have been tried out for some time, and the concern will now begin actual market production.

Stearns and Leahy are Advanced.

E. Roger Stearns, manager of the Buffalo branch of the Ford Motor Co., has been appointed general representative of the company, with headquarters at Detroit. He is succeeded at Buffalo by M. R. Leahy, assistant New York City manager.

Houpt Has a Broadway Location.

Harry S. Houpt has secured quarters in the Rhinelander building, Sixty-eighth street and Broadway, New York City, as salesrooms for the Herreshoff and later for the new Houpt cars. The place will be ready for occupancy by February 15.

THE WEEK'S INCORPORATIONS.

Wyalusing, Pa.—Auto Transit Co, under Pennsylvania laws, with $5,000 capital.

Anderson, Ind.—Speed Changing Pulley Co., under Indiana laws; capital increased from $60,000 to $300,000.

Fort Worth, Tex.—Reid Automobile Co., under Texas laws, with $15,000 capital. Corporators—R. T. Reid, H. H. Hunter et al.

Toledo, O.—Toledo Auto Dealers' Association, under Ohio laws, with $5,000 capital. Corporators—J. G. Swindeman and others.

Cincinnati, O.—American Auto and Sales Co., The, under Ohio laws, with $25,000 capital. Corporators—H. D. Anderson and D. M. Twombley.

Houston, Tex.—Auto Co., of Houston, The, under Texas laws, with $1,000 capital. Corporators—Harvey T. D. Wilson, H. S. Wilson and Van Curtis.

Boston, Mass.—Adams Motor Transfer Co., under Massachusetts laws, with $100,000 capital. Corporators—W. E. Eldridge, president and treasurer, et als.

Brooklyn, N. Y.—Jurinck Auto Company, under New York laws, with $5,000 capital. Corporators—M. F. Jurinck, Leroy R. Smith, Anna Jurinck and Ida Smith.

Minneapolis, Minn.—Minneapolis Automobile Show Association, under Minnesota laws. Corporators—H. E. Pence, Harry E. Wilcox and F. E. Murphy, Minneapolis.

Dubuque, Ia.—Wallis and Culbertson Co., under Iowa laws, with $10,000 capital; automobile business. Corporators—J. M. Culbertson, Jr., J. H. Wallis and J. A Wallis.

St. Louis, Mo.—Doyle-Curran Motor Car Co., under Missouri laws, with $2,000 capital. Corporators—Con P. Curran, Elise Gignoux, Edward M. Doyle, Lulu B. Doyle.

Dover, Del.—American Wagon Co., under Delaware laws, with $100,000 capital; to manufacture taximeter cabs and other vehicles. Corporators—Wilmington fiscal agents.

Cincinnati, O.—Eagle Automobile Co., The, under Ohio laws, with $10,000 capital. Corporators—R. D. H. Anderson, F. R. Flied, F. G. Stutzman, Fred Keife and E D. Woodward.

Fort Smith, Ark.—Ward-Harris Auto Co. of Fort Smith, The, under Arkansas laws, with $25,000 capital. Corporators—J. N. Ward, president; R. P. Harris, F. N. Ward, E. N. Ward.

Bridgeport, Conn.—Fairfield Auto Co., The, under Connecticut laws, with $15,000 capital. Corporators—William P. Hall and H. D. Gates, Bridgeport; Edward R. Hampton, Milford.

Boston, Mass.—Kennedy Ideal Carburetter Co., under Massachusetts laws, with $25,000 capital; to do a general automobile business. Corporators—J. C. Kennedy, W. E. Spear et al.

Far Rockaway, N. Y.—Rockaway Taximeter Cab Co., The, under New York laws, with $1,000 capital. Corporators—Edward Griffen, Patrick Griffen and Peter Murphy, Far Rockaway.

Toledo, O.—Roberts-Toledo Auto Co., The, under Ohio laws, with $10,000 capital. Corporators—Frank L. Mulholland, L. M. Colgan, A. D. Williams, Charles Hartman, C. M. Sherman.

New York City, N. Y.—Weaver-Ebling Automobile Co., under New York laws, with $25,000 capital. Corporators—R. H. Weaver, R. W. Ebling and H. H. Pennock, New York City.

Streator, Ill.—Streator Motor Car Co., under Illinois laws, with $30,000 capital; manufacturing automobiles. Corporators—J. C. Barlow, L. P. Halladay, P. R. Chubbuck, Streator, Ill.

Los Angeles, Cal.—Auto Air-Cushion Wheel Co., under California laws, with $1,000,000 capital. Corporators—G. L. Berger, J. H. Snowden, G. H. Langton, E. E. Powers and H. F. Armour.

Omaha, Neb.—H. E. Frederickson Automobile Co., under Nebraska laws, with $100,000 capital. Corporators—H. E. Frederickson, Sydney L. Edholm, William F. Kemp and Thomas Bromwell.

Los Angeles, Cal.—Los Angeles Vulcanizing Co., under California laws, with $10,000 capital. Corporators—C. A. Bennett, W. J. Bennett, George Bennett J. G. Bennett and C. S. Robinson.

Belleville, Ill.—Western Automobile and Electric Co., The, under Illinois laws, with $2,500 capital. Corporators—John L. Muren, A. L. Muren, H. L. Muren, E. Twenhoefel and Edmund Burke.

Chicago, Ill.—Motor Appliances Co., under Illinois laws, with $2,500 capital; to manufacture automobiles, motors and accessories. Corporators—J. W. Lindgren, E. H. Tillson, A. L. Ringo.

Chicago, Ill.—Skinner & Skinner Co., under Illinois laws, with $2,500 capital; to manufacture automobiles and accessories. Corporators—Stephen G. Skinner, Ada B. Skinner, Franklyn J. Mayo.

Newark, N. J.—National Association of Automobile Owners, under New Jersey laws, with $125,000 capital. Corporators—Thomas H. Ramsdell, J. Frederick Switzer and Frederick M. P. Pearce.

Minneapolis, Minn.—Northwestern Automobile Co., The, under Minnesota laws, with $100,000 capital. Corporators—W. E. Wheeler and William Eggleston, Minneapolis; George Dorr, St. Paul.

Belleville, Ill.—Modern Automobile & Garage Co., under Illinois laws, with $2,000 capital. Corporators—I. H. Wangelin, Joseph Schwarz, Edward L. Schwarz, Ludwig L. Carl, Mrs. Louise W. Wangelin.

Monmouth, N. J.—William McKinley & Co., under New Jersey laws, with $10,000 capital; to deal in farm implements, automobiles, etc. Corporators—William McKinley, James Ralph Firoved, Roscoe William McKinley.

Brooklyn, N. Y.—Kunkel-Lebman Co., under New York laws, with $3,000 capital; to manufacture automobiles. Corporators—Josepr Kunkel, Charles F. Lebman, Katherine K. Kunkel, 269 Clifton place, Brooklyn.

Waterville, Me.—Waterville Motor Co., under Maine laws, with $20,000 capital; to do a general garage and automobile livery business. Corporators—Ira L. Belyea, president; treasurer, John J. Hennings, both of Waterville.

Evansville, Ind.—Traveller Automobile Co., The, under Indiana laws, with $25,000 capital; to manufacture and sell automobiles. Corporators—Harry Stinson, Jacob Haas, Adam Bromm, Fred Bockstage and Paul C. Bietz.

New Haven, Conn.—New Haven Taxicab Co. The, under Connecticut laws, with $25,000 capital; general taxicab, automobile livery and transportation business. Corporators—George G. Nesbit, Peter C. Nesbit, Robert C. Nesbit.

Salt Lake City, Utah—Sharman Automobile Co., under Utah laws, with $2,000 capital; to deal in automobiles. Corporators—Samuel H. Sharman, president and treasurer; Frances A. Sharman, vice-president, and Anna Schneider, secretary.

New York City, N. Y.—Carter Garage Co., under New York laws, with $5,000 capital. Corporators—W. Gibbs Whitney, 27 Williams street, New York; William S. Walsh, 116 Prospect place, Brooklyn; Josephine Caldwell, 487 Tenth street, Brooklyn.

Oklahoma City, Okla.—Citizens Motor Car Co., under Oklahoma laws, with $25,000 capital; to do a general automobile business. Corporators—Weston Atwood, president; Guy Blackwelder, vice president; Ray Colcord, treasurer; A. H. Denham, secretary.

New York City, N. Y.—Bilbro Auto Co., under New York laws, with $20,000 capital; to manufacture automobiles, conduct garage, etc. Corporators—James E. Troy, 412 St. Nicholas avenue, New York; William L. Brown, Westfield, N. J.; Ernest Mayer, 300 East Sixth street, New York.

Patchogue, N. Y.—Bellman Auto Co., under New York laws, with $10,000 capital; garage business and dealing in motors. Corporators—Edmund R. Bellman, Bayport, N. Y.; Charles S. Skinner, 16 West 127th street, New York City, N. Y.; Brockholst K. Miller, Plainfield, N. J.

Brooklyn, N. Y.—Bath Beach Garage & Machine Co., under New York laws, with $2,500 capital; to manufacture and deal in automobiles and maintain garages. Corporators—George E. Reiners and Leonie F. Reiners, 1929 Eighty-sixth street; William H. Geiffin, Twenty-second avenue, corner Bath avenue, Brooklyn, N. Y.

IN THE RETAIL WORLD.

The Howard Automobile Co., Los Angeles, Cal., is among that city's newcomers. It is housed at 1806 South Main street.

C. F. Smith is a new agent in Wichita, Kan. At his garage, 156 North Fmporia avenue, he will handle the Franklin exclusively.

The P. L. Abel Cycle Co., which handles the Franklin in El Paso, Tex., has moved to a new garage. The building is at 324 Texas street.

The Mitchell Automobile Co., 282 Halsey street, Newark, N. J., has changed its name. It will now be known as the Crawford Automobile Co.

E. C. Eads, of Leavenworth, Kan., started a garage and automobile salesroom on February 1. He will have the agency for Rambler, Ford and Mitchell.

The Morristown Motor Co., of Morristown, Tenn., is to build a pretentious garage. Sam Welch, a Ford agent, is the leading spirit in the enterprise.

In Cedar Rapids, Ia., a new automobile concern, known as the Chicago Motor Car Co., has opened for business. It occupies the old Republican building.

Elwood City, Pa., is to have an automobile repair shop and garage. A local machinist by the name of Blackburn is building the establishment on Spring avenue.

The Hamilton Auto Co., of Allentown, Pa., has taken possession of the former Rink property on Hamilton street. William Weaver has charge of the concern.

The Kansas Motor Car Co., of Wichita, Kan., has taken a location at 217 South Main street. D. A. Wallace, of Hutchinson, has been engaged as manager of the garage.

Harry Cunningham has been appointed manager of the Everitt-Metzger-Flanders Co.'s retail branch in Detroit. Previously he had charge of the Ford Motor Co.'s store in the same city.

F. L. Smith, manager of the Waverly and Elmore salesrooms in Cleveland, O., has moved his establishment to new quarters. He is now located at East Nineteenth street and Euclid avenue.

I. Stubley & Sons, of Newburgh, N. Y., have decided to engage in the automobile garage and repair business. A new building for their use is being erected in Broadway, opposite Lander street.

Nevada, Iowa, is to have a new garage, to be erected by a company of which ex-Judge Stevens, of Boone, is a member. The company has secured options on a number of Lynn street frontages.

R. W. Sturges, of Meridian, Miss., is taking a course in automobile instruction and expects to assume the agency of one or two companies in Meridian within a few weeks. The town has never before harbored motor cars.

Lucas & Christenson, of Cleveland, O., have taken new quarters at 2139 East Eighteenth street. A general garage and storage business will be conducted in addition to the sale of Mitchell cars.

The Davis Square Auto Co., of West Somerville, Mass., has been sold by its proprietor, Winsor L. Snow, to Frank C. Tuckey, of Reading. The new owner will take possession in a few days.

R. D. & C. O. Britton have nearly completed the remodeling of their building on Allyn street, Hartford, Conn. It now includes, besides the four-story garage, a large salesroom with show windows.

The Paegel-Allen Co., Minneapolis, Minn., handling the Schacht cars, has secured more commodious quarters, which bring the concern nearer "Automobile Row." It has moved to 1405-7 Hennepin avenue.

The Standard Auto Co., of Rockford, Ill., will inaugurate its business career within a few days, by a reception to local automobile owners. The company's garage is located at Charles and Sixth streets.

C. A. Stotlar, who left the automobile business in which he was engaged at Devils Lake, N. D., to become train dispatcher on the Great Northern Railway, has decided to resume his Devils Lake enterprise.

C. R. Talbott's garage and farm implement store, occupying a three-story brick building in Springfield, Ill., was burned January 2. Five automobiles were destroyed. The loss is placed at $40,000.

The Speedwell Motor Car Co., of Dayton, Ohio, has secured a lease for a term of years of the store and basement at 2002 Broadway, New York City. It will be the New York headquarters for the company.

The Ideal Auto Co., Des Moines, Ia., owned by G. D. Ellyson, has been bought by Dr. Lewis Schooler and his son, Dean Schooler, of Madrid, Ia. The new proprietors were in the banking business until recently.

John N. Taylor has bought the Selby & Figgins garage in Moberly, Mo., in additionto which he will also open a garage in Columbia. Taylor aquired his capital in the music store and furniture business in Huntsville, Mo.

The Great Western Motor Car Co. has opened headquarters at 1326 Michigan avenue, Chicago, under the management of Phillip A. Miller. The concern is to handle the line produced by the Model Automobile Co., of Peru, Ind.

Seeley, Van Zandt & Crackel, 938 South Main street, Los Angeles, Cal., have been added to the list of distributors for the Continental Caoutchouc Co., of New York. They will distribute Continental tires, demountable rims and accessories in lower California.

V. A. Charles, who for several years has been identified with the automobile trade in New England, has taken charge of the automobile department of the S. M. Supplies Company, of Boston. The new Inter-State line of cars will be handled.

Lexington, Ky., is housing another automobile agency, S. E. Drake & Co. having rented a new store and arranged to handle the Oakland and the International in that city. The latter is a high-wheel buggy manufactured by the International Harvester Co.

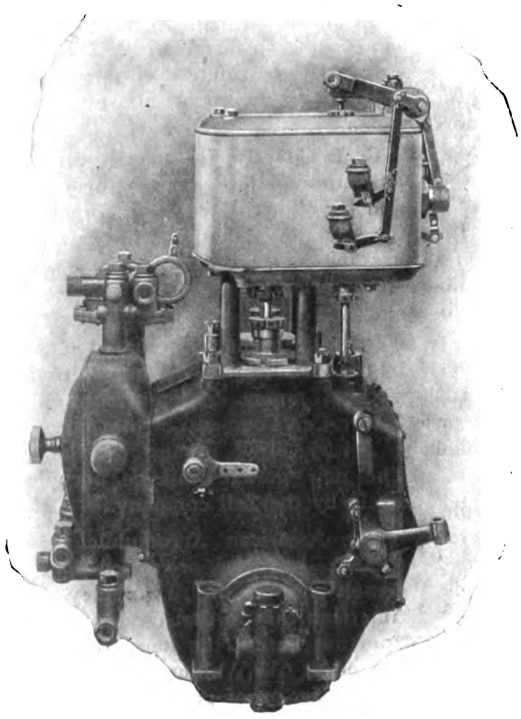
The Continental Caoutchouc Co. has appointed the Columbus Buggy Co., 810-14 Walnut street, Kansas City, Mo., as one of its western distributers. The latter concern will distribute Continental tires and material in western Missouri and Oklahoma.

C. J. Conolly, for many years a bicycle and automobile agent in Rochester, N. Y., and later on the traveling force of the Motor Car Equipment Co., of New York City, has joined the forces of the Mutual Auto Accessories Co. He will cover his old territory.

Having recently purchased a 50x96 foot lot on Mt. Royal avenue, Baltimore, Md., Arthur Stanley Zell, president of the Zell Motor Car Company of that city, will erect a 3-story brick garage on the premises. The new garage will be occupied exclusively by the Zell company.

The American Automobile Co., Cincinnati, O., has been organized by H. D. Anderson and D. M. Twombley, to handle American cars in that city and its vicinity. For the present the new company will be located at 630 Walnut street, but will later erect a fire-proof garage downtown.

The Philadelphia headquarters of A. G. Spalding and Bros. have been moved to 202-204 North Broad street. The building, which has been refitted for the purpose, will be the Quaker City home of the Stevens-Duryea, for which the company has the New York and Philadelphia agency.



The New Brunswick Garage, with J. Weigel as proprietor, has opened for business at 146 Church street, New Brunswick, N. J. In the new fireproof building a general garage and repair business will be conducted when a special apparatus for charging electric cars has been installed.

The Cedar Valley Auto Co. has opened an office in the First National Bank building, Waterloo, Ia., pending the completion of its garage on Sycamore street. The company, of which A. N. Miller, Panora, Ia., is president, and J. W. Place, secretary and manager, will handle the Studebaker lines.

The Indiana Carriage and Automobile Co. is a newly incorporated concern which succeeds the Indiana Carriage Co., of Indianapolis. C. E. Wilson is president, F. R. Bernard secretary and M. G. Beckner, treasurer and general manager. The first floor and basement of the four story building at 27-33 North Capitol avenue, will be devoted to automobiles.

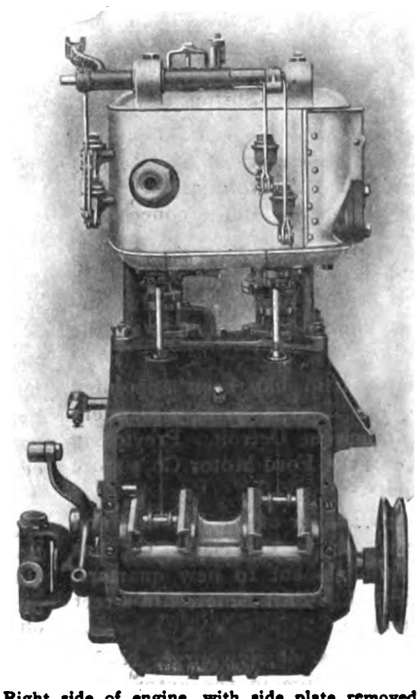
THE SIMPLICITY OF
The White Steam Engine

Rear View of Engine



THE accompanying illustrations show the simplicity of construction of the engines used in the 20 horse-power and in the 40 horse-power White Steamers (the power plants of the two models are identical except as regards size). The White engine is more compact, weighs less and has fewer parts than any other automobile engine of similar power rating.

Each cylinder of the White engine is delivering power all of the time; that is, there is steam pressure back of each piston, pushing it in the direction in which it is going, whether moving up or down. In other words, each of the two cylinders of the White engine is equal to four cylinders of a gasoline engine, as regards continuous application of power.

It will be noted that there is no fly wheel on the White engine and that it is attached positively to the driving shaft without the use of a friction clutch. The engine is reversed simply by changing the tilt of the valve guide, shown in the lower illustration.

The crank-shaft of the White engine is a short one-piece forging with but two main bearings. The valves are driven from the connecting rods, this construction being known as the Joy valve motion. There is but one valve for each of the two cylinders. The valves are of the piston type and, the steam pressure being the same on all sides of them, the power necessary to operate them is negligible.

The White engine is the only automobile engine which develops great power at very low speeds, and even when starting. The driver of a White can operate his car at any rate of speed desired —from a "crawl" to the highest speed of which the car is capable —simply by varying the speeds of the engine. This is done by means of the throttle, the action of which is to vary the amount of steam admitted to the cylinders.

Right side of engine, with side plate removed from crank-case, showing the valve-guide

NEW YORK, FEBRUARY 4, 1909.

Significance of the Chicago Show.

What is generally looked forward to as an epoch-making year in the industry so far as the middle and western sections of the country are concerned at least, is inaugurated by the eighth annual automobile show which opens in Chicago on Saturday of this week. Following a year in which market conditions have been affected only by financal considerations and with the producing sections of the country in a condition of eminent prosperity, the present season has opened with every prospect that the western farmers and townsmen will have plenty of money to supply their needs. More than this, it is significant that to a greater extent than ever before, the automobile makers are going after this particular section of the field, both in the manufacturing and sales ends of the business. Several makers, in fact, are marketing models directly designed for the farmers' needs, while these and others are known to have instituted a most thoroughgoing campaign for the harvesting of any possible trade which may lie afield in the districts whence the real prosperity of the nation is drawn.

The Chicago show figures conspicuously in this connection alike as a convenient rendezvous for the partial and final producers of the industry who are massed to so great an extent in the centre of the continent and for the buying class and their local representatives to whom Chicago represents the ideal of all that a general mart should be. To a much greater extent than is true of either of the other big annual shows, Chicago draws from the surrounding and even from the distant country for its visiting contingent of buyers and possible buyers, and therefore it secures a sort of practical and very characteristic atmosphere which is totally at variance with that of any other show. In fact, to the close observer it is noticeable that the attitude of the average show-goer is of a much more practical sort than is that of the average visitor at the New York shows, and that his questions indicate a far shrewder disposition and a desire to secure his full dollar's worth, which in the other case is sometimes lacking altogether. On this account, quite as much as because it draws from the manufacturing field a large number of makers who for one reason or another seldom or never venture to the coast to exhibit, the National aspect of this great show is a thing to be studied and approved.

Growth of the Foreign Trade.

Rewarded adequately in money profits, no doubt, the manufacturers who have most largely participated in the export trade during the past year have but little need of outside congratulation, gracefully as they might accept it, but the American automobile industry as a whole is to be felicitated on the fact that the year's record shows a splendid "balance of trade" for the United States so far as the interchange of motor cars with other countries is concerned. The imports of cars, exclusive of parts, during 1908 amounted to $2,558,819, while the exports came to $4,346,293, making a cash difference of $1,787,474, a neat little bundle calculated to serve as convincing evidence that the real headquarters of automobile production may now be found on this side of the ocean.

It may be that language uniformity accounts for the greater success which American cars enjoy in the United Kingdom than elsewhere abroad. With the vast continent from the Atlantic to the Pacific speaking the one tongue, Americans have ever been reluctant to undertake the labors of learning the languages of Europe, so that probably the best and most effective export work has been chiefly confined to the English-speaking countries. Further successes in France, Germany, and in other Continental divisions may be expected, however, as larger forces of trained men, linguistically equipped, are directed to these fields.

When a manufacturer is busy with a domestic market big enough to engage all his productive energies, it requires particularly far-seeing qualities on his part to tempt him into the bothersome field of export. Yet there are makers of whom it is known that they could sell in the domestic market every car they make, who nevertheless set aside a portion of their output each year for foreign countries. It broadens the foundations on which their business is built and gives them the security of a wider average of business conditions. As shown by the figures, there are great outside markets for American cars. The fruits of these markets is for the manufacturer who cultivates them.

Influence of the Parts Maker.

Viewed in the important light of consulting engineers to the industry at large, the parts makers begin to assume a degree of prestige which is entirely new to them so far as the general public is concerned. Yet those comprising the better and more successful class of parts makers have earned for themselves just this distinction and are entitled to practically all that it involves. Ever since the appearance of the first all-assembled cars, there has been a general feeling that the parts makers as a class were part and parcel of a tendency to cheapen the automobile product as a whole; that they represented a phase of the process of standardization not wholly to be desired.

Instead it is a fact very much appreciated by many a manufacturer, that the parts makers themselves have been directly responsible for numerous improvements in car construction which have been of a general and sweeping nature, and which have affected not simply the assemblers, but also the proud standbys whose slogan it has been from the very beginning that they produce from 90 to 100 per cent. of their entire product. For the parts maker, in the guise of specialist, is placed in the enviable position of the expert who is able to isolate

Digitized by Google

for his own consideration the particular problem upon which he is engaged and to give it the very best of his concentrated effort. This the manufacturer who is attempting to establish the perfection of his whole product simultaneously or as nearly so as possible, cannot do and the result is that through the entire range of accessories to structural parts, and from tires and springs to radiators and fenders, there are many parts which are commonly regarded as best produced as well as most economically produced by the makers who concentrate upon those lines to the exclusion of all others.

But the influence of the parts maker is even broader than this would indicate. For in the highest development of the class are found makers who see the wisdom of refusing to install their products except under circumstances which they themselves are assured will afford a reasonable guarantee of excellence in performance. In order to determine whether or not the proposed buyer is capable of using their products to the best advantage, they act in a sort of self-constituted advisory capacity, going over the preliminary designs of the assembler, checking up his ideas with their own, getting his viewpoint and incidentally extending their own scope of vision, and finally condescending to sell him only when they are convinced that the use of the parts will redound to their own credit. As a result of this policy, those parts makers who have adhered to it rigorously have come to number among their clients some of the best known and most prosperous makers and have themselves secured an amount of business which is equally enviable in quality and in quantity.

In thus assuming a degree of responsibility for the final product, which at first sight appears to be of an entirely charitable nature, but which on analysis is seen to be of the most interested breed, the parts producers have become the economic mainstay of the American industry. Furthermore, so long as they continue to follow the lines of procedure which characterize the efforts of the most successful of their number, there can be small question of their continued prosperity.

Much is being said just now of the inaccuracy of the common methods of expressing the power of the motor, of the impossibility of securing a close yet simple rating formula, and of how the average motorist is absolutely unable to tell the horsepower output of his machine except by quoting the figures given in the makers' catalogues, these, in turn, being admittedly inexact in very many cases. Granted that all this is so, one who is able to recall experiences with the older motors in the days when every motorist must be his own engineer, is moved to inquire "What's the use?" Whether he knows to the last foot pound what power his motor will develop, or whether he can only approximate it, the fact remains that as a means of vehicular propulsion it performs its expected function in quiet, unostentatious fashion, and it would almost seem that the question of its power, like that of the area of its valves, might now be turned over entirely to the tender mercies of the builder, and with perfect trust and confidence.

Contracts for complete upkeep and maintenance at a fixed sum per month are being tried in the case of both pleasure cars and commercial vehicles, and they appear to have an attraction for the user that is destined to give them no little popularity. The garage proprietor attempting to handle any business on this basis can advantageously take a leaf from the book of the pioneers' experience. This experience shows that the price asked must be fairly high and that correspondingly the service given must be thorough, painstaking and liberal, in order to be profitable on the one side and satisfactory on the other.

One of the New York "auto editors" gravely and with considerable prominence states that novelty will be given to the Florida speed carnival by the employment of "the cylinder displacement" formula in certain handicap events. When they begin to displace the cylinders, or when the cylinders begin to displace anything the novelty certainly will be so great as to command the attention of the civilized world. It is hoped that the details of the marvelous formula will not be too long withheld.

In discussing the appropriation for the purchase of automobiles for the incoming President, Congress almost has measured up to the standard of a board of aldermen. The narrow-gauge opinions expressed by some of the opposing "statesmen" make it easier to understand the conditions prevailing and the lack of progress of those portions of the country which they represent.

COMING EVENTS

February 6-13, Chicago, Ill.—National Association of Automobile Manufacturers' show, Coliseum and First Regiment Armory.

February 15, Detroit, Mich.—Detroit Automobile Dealers Association's show, Wayne Pavilion.

February 15-20, St. Louis, Mo.—Automobile Manufacturers and Dealers Association's annual show.

February 15-20, Bangor, Me.—Eastern Maine automobile show, Auditorium.

February 16-18, Denver, Co.—Denver Motor Club's first annual show, Auditorium.

February 17-20, San Jose, Cal.—Automobile show, Auditorium Rink.

February 20, 21, 22, New Orleans, La.—New Orleans Automobile Club's Mardi Gras carnival 3 days race meet.

February 20-27, Newark, N. J.—New Jersey Automobile Trade Association's show.

February 20-27, Hartford, Conn.—Automobile Dealers Association's show.

February 22, Omaha, Neb.—Omaha and Council Bluffs dealers' show, Auditorium.

February 22, Cleveland, O.—Cleveland Automobile Dealers Company's show, Central Armory.

February 22-27, Portland, Me.—Automobile show.

February 24-27, Baltimore, Md.—Automobile Club of Maryland's show, Fifth Regiment Armory.

March 1-6, Buffalo, N. Y.—Buffalo Automobile Club's 7th annual show, Convention Hall.

March 1-6, Providence, R. I.—Automobile show.

March 2-6, Rochester, N. Y.—Automobile and Motor Trades Association of Rochester show, Convention Hall.

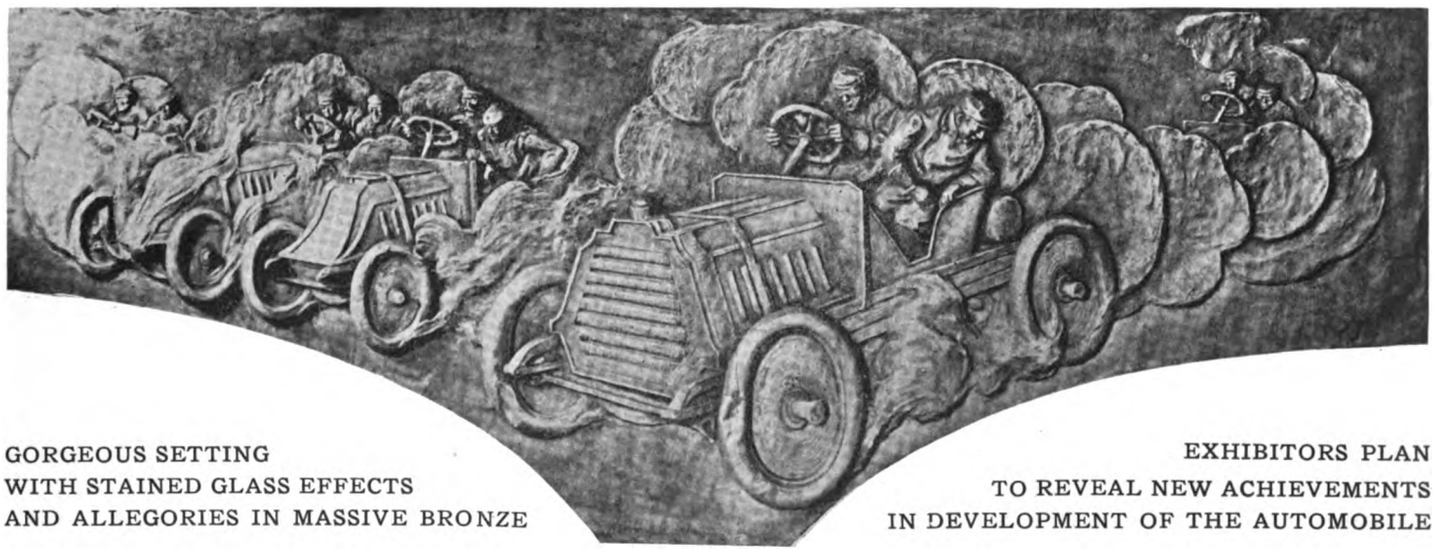
March 6-13, Boston, Mass.—Boston Automobile Dealers Association (Inc.) seventh annual show, Mechanics Building.

March 8-13, Kansas City, Mo.—Kansas City Automobile Dealers Association's show, Convention Hall.

March 8-13, Portland, Ore.—Portland Automobile Club's show.

March 10-13, Memphis, Tenn.—Automobile show, Auditorium building.

March 13-20, Minneapolis, Minn.—Minneapolis Automobile Show Association's show, National Guard Armory.



March 15-20, Rochester, N. Y.—Rochester Automobile Dealers Association's show, Convention Hall.

March 27-April 3, Pittsburg, Pa.—Automobile Dealers Association's show, Duquesne Garden.

April 15-17, Louisville, Ky.—Louisville Automobile Association's show, Coliseum.

CHICAGO PROMISES GREATEST SHOW

GORGEOUS SETTING
WITH STAINED GLASS EFFECTS
AND ALLEGORIES IN MASSIVE BRONZE

EXHIBITORS PLAN
TO REVEAL NEW ACHIEVEMENTS
IN DEVELOPMENT OF THE AUTOMOBILE

Despite its traditional, breezy and—at show time—usually frigid atmosphere, Chicago always manages to accord a welcome to those who visit its show, which is in no way tempered by conditions of climate, but is wholesome and hearty. The reasons for this are manifold. But outside the purely temperamental one of the cordiality, which is due to its geographical location, the principle reason probably is that Chicago is proud of her boast that she harbors the only truly national automobile show. The Chicago show, as is observed from year to year, is of more nearly national character than any other, first, because it is free from the factional tenencies of the exhibitions which are conducted by one or the other of the two great opposing associations of manufacturers, and second, because its central location affords it an advantage to the possible buyer who is anxious to learn what the market holds for him personally, and so is in many respects an even more attractive proposition to the maker than either of the New York displays.

The show which opens in the Coliseum on Saturday afternoon of this week will be no exception to the rule. In fact, it will be, if anything, more national in character than any which has preceded it, because of the generous attendance of many of the smaller makers of the Middle West who have not before exhibited this year. It will differ from last year's show in that there will be no separate exhibition of commercial vehicles, and thereby the visitor will be in a measure encouraged. For it means that his travels up and down the booths of the exhibitors will be confined to the Coliseum and the First Regiment Armory, which is but a step off, and that he will not be forced to pioneer his weary way through several blocks of desolation to the ancient Tattersalls wherein the commercial section was displayed a year ago. Nevertheless, the commercial element of the industry will not be dormant so far as the show is concerned, as many of those who produce commercial as well as pleasure cars have arranged to place samples of this portion of their product on the stands with their other cars. The number of those displaying commercial cars exclusively, however, will be reduced to 2.

In preparation for this, the eighth national show, to be held under the auspices of the National Association, which, by the way, is the eleventh which has been held in Chicago under one management or another, due attention has been paid to the important matter of decorations. Last year, the element of staff work was introduced liberally into the decorative scheme with good effect, and this year its use is to be increased, but with the material addition here and there of an element to show decorations in the shape of stained glass panels. These, it is hinted by the management, are to be tried out in an experimental way, in order to determine their full value with an eye to future shows. For it is the custom of show managements to study their decorations as far in advance as possible.

For the main floor of the Coliseum much the same general plan as that adopted for last year will be employed. That is to say, the booths will be divided by elevated arches supported on more or less ornamental columns, the effect being to break up the barrenness of the floor area, thus affording a background for each of the individual exhibits. Instead of the whitened or tinted tone of the staff, as was used last year, liberal use will be made of bronzing with the result that the entire ornamentation of the show will bear an aspect of metallic stability entirely different from anything before attempted.

The floor will be divided into four main groups with aisles of equal size forming a cross. Down the centre of each island will be a main dividing structure, whose pillars, rising to the height of 15 feet, will bear representations of the various phases of automobiling—sport, utility and commerce—bronze statuary in different heights and varying motives furnishing the medium. At the centre of each group of a huge wheel, some six feet in diameter, will be represented, and below it the representation of a man of heroic stature, bent in the effort of giving it impetus. Stretching to the right and left an outwardly curving arch will afford a backing for two paintings of automobile scenes, and four stained glass windows, two on either side, one pair being rectangular and the other round. The remainder of the structure will be backed with green silk and gold trimmings.

The lettering of the exhibitors' names will be in white and gold with raised characters mounted on a red silk background. The signs will run along the top of the sections, while above them will be a row of flower boxes filled with real ferns and flowers.

The principle of uniformity in decorations, of course, will be carried out in all parts of the show. The walls are to be concealed by wooden panels, raised to a height of 10 feet from the floor, and in Mission finish, while in the arena of the Coliseum the balcony fronts will be treated in panelling of lighter shades. The same effect will be carried over the entire roof. For illumination, generous use will be made of flaming arc lights, while the usual profusion of incandescent bulbs—some concealed, some of large size and placed more with regard to their illuminating value than their ornamental effect, will serve to dispel the gloom from the otherwise obscure corners.

The complete roster of exhibitors, corrected to date, includes a grand total of 252 displays. Of these no less than 92 will be devoted to the exhibition of complete cars. Twenty-one booths will be given over to the display of motorcycles, while the ex-

Digitized by Google

hibitors of parts, accessories, materials and supplies of various sorts, will occupy no less than 130 booths, with a prospect of an additional number squeezed into odd corners sub-let from those whose names regularly appear on the list.

Having seen a great proportion of the cars, as of the other exhibits, at one or the other of the New York shows, the eastern visitor always is tempted to the belief that Chicago will present little that is really new to his eyes. And in this he is as constantly disappointed. For it is the habit of many automobile makers to bring out new body mountings especially for the Chicago exhibit—sometimes even new models as well—while occasionally exhibits which have been completed too late to appear in New York appear there. Furthermore, the flood tide of accessory novelty never lets up, and invariably there are a number of surprises ready to be disclosed when the doors open—even among those who have exhibits at the Palace or Garden. In this respect the forthcoming show promises to be in no wise behind its predecessors.

In the matter of cars produced by makers who have not shown before this season, the visitor will find ample opportunity for investigation in studying the construction of the 23 different types of vehicle on view for the first time this year. In fact no less than 11 of them have not been shown before in Chicago, and if at all, only in purely local shows. The makers of these new cars are as follows:

American Locomotive Co., Auburn Automobile Co., Bartholomew Co., Bendix Co., The: Berliet Import Co., Buick Motor Car Co., Chicago Coach & Carriage Co., Clark-Hatfield Auto Co., Columbus Buggy Co., Dorris Motor Car Co., Fort Pitt Motor Mfg. Co., Jeffery & Co., T. B.; Meteor Motor Car Co., Mier Carriage & Buggy Co., Model Automobile Co., Olds Motor Works, Randolf Motor Car Co., Ricketts Auto Works, Rider-Lewis Motor Car Co., Staver Carriage Co., Streator Motor Car Co., Owen Thomas Motor Car Co., Zimmerman Mfg. Co.

As being essentially a product of the central portion of the country, the high wheeled motor buggy in all its phases will be displayed to particularly good advantage. There will be on view the products of no less than 10 makers devoted exclusively to this field. Furthermore, 6 of them will be of particular interest as being included in the list of those who have not exhibited previous to the Chicago show.

In this connection it is noteworthy that the list of newcomers is by no means confined to any particular class or type of vehicle, however. Among the cars staged for the first time will be found examples of practically every type of motor vehicle in common use from the light high wheeled vehicle up to and including the rather elaborate six cylinder machine. Nor will these cars be found lacking in the elements of novelty and originality which constitute the spice of the show study. Several of them, in fact, embody details of construction which are more or less remarkable in their construction or operation.

It has been observed frequently enough that the period of noticeable and noteworthy trends in the industry is long past. Matters of detailed construction no longer possess the fascination for the average showgoer that they used to have. Nevertheless, if one marked tendency is to be observed, it may be set down as residing in the quarters occupied by the cars of medium power

DECORATIVE DETAIL IN STAINED GLASS

and price. These middle-class vehicles are fast assuming the proportions of a majority in the industry just now, and their presence at the two New York shows constituted their most remarkable feature in many respects. Chicago, as the Mecca for makers catering to the demand of the masses, however, seems likely to prove an even more important revelation in the matter of the growing production and the growing popularity of these vehicles of the so-called popular type.

The Cars Not Shown in New York.

A. L. Co.	Halladay
Auburn	Meteor
Bendix	Mier
Berliet	Oldsmobile
Buick	Owen Thomas
Clark-Hatfield	Pittsburg Six
Columbus Electric	Randolf
Dorris	Ricketts
Duer	Rambler
Emancipator	Rider-Lewis
Glide	Staver
Great Western	Zimmerman.

It has been observed that the accessory sections will be in no wise lacking in novel features, even among those exhibitors who already have shown in New York. In addition to these, however, there will be a substantial contribution of new things shown by makers who are exhibiting for the first time this season, and who will be present to the number of 35. They are as follows:

Eugene Arnstein, Bower Roller Bearing Co., S. Breakstone, Central Rubber Co., Chicago Pottery Co., Chicago Recometre Co., Commercial Battery Electric Co., Duplex Coil Co., Fellock Auto Mfg. Co., Fok Metallic Tire Belt Co., Fulton & Zinke, Emancipator Automobile Co., Goshen Rubber Works, Hancock Mfg. Co., Imperial Brass Mfg. Co., C. P. Kimball & Co., Limousine Carriage Mfg. Co., Lougdin-Brugger Co., Long Mfg. Co., London Auto Supply Co., McCanna Mfg. Co., Edward Neeley & Co., Pfanstiehl Electrical Laboratory, Rochester Safety Lock Co., Ross Gear & Tool Co., Fred Smith, F. E. Sparks, Standard Varnish Works, Twentieth Century Motor Car Co., Triple Action Spring Co., Universal Tire Protector Co., Vehicle Top & Supply Co., Vivax Storage Battery Co., Westinghouse Co., Whiteley Steel Co.

The official list of exhibitors at the Coliseum and Armory, their locations and the wares which they will display, corrected to date, is as follows:

AUTOMOBILES.

Coliseum—Main Floor.

American Locomotive Co., New York, F-1—Locomotive gasolene cars.

Apperson Bros. Automobile Co., Kokomo, Ind., E-1—Apperson gasolene cars.

Apperson-Toledo Motor Co., Toledo, O., E-4—Toledo gasolene cars.

Babcock Electric Carriage Co., Buffalo, N. Y., B-3—Babcock electric cars.

Baker Motor Vehicle Co., Cleveland, O., B-4—Baker electric cars.

Bartholomew Co., The, Peoria, Ill., H-1—Glide gasolene cars.

Buick Motor Co., Flint, Mich., E-2—Buick gasolene cars.

Cadillac Motor Car Co., Detroit, Mich., D-3—Cadillac gasolene cars.

Corbin Motor Vehicle Corporation, New Britain, Conn., F-4—Corbin gasolene cars.

Dayton Motor Car Co., Dayton, O., D-2—Stoddard-Dayton gasolene cars.

De Luxe Motor Car Co., Detroit, Mich., J-1—De Luxe gasolene cars.

Elmore Mfg. Co., Clyde, O., A-6—Elmore 2 cycle gasolene cars.

Everitt-Metzger-Flanders Co., Detroit, Mich., C-2—E-M-F gasolene cars.

Franklin Mfg. Co., H. H., Syracuse, N. Y., D-6—Franklin gasolene cars.

Haynes Automobile Co., Kokomo, Ind. C-6—Haynes gasolene cars.

Holsman Automobile Co., Chicago, Ill., E-3—Holsman motor buggies.

Jeffery & Co., Thomas B., Kenosha, Wis., B-2—Rambler gasolene cars.

Knox Automobile Co., Springfield, Mass., G-2—Knox gasolene cars.

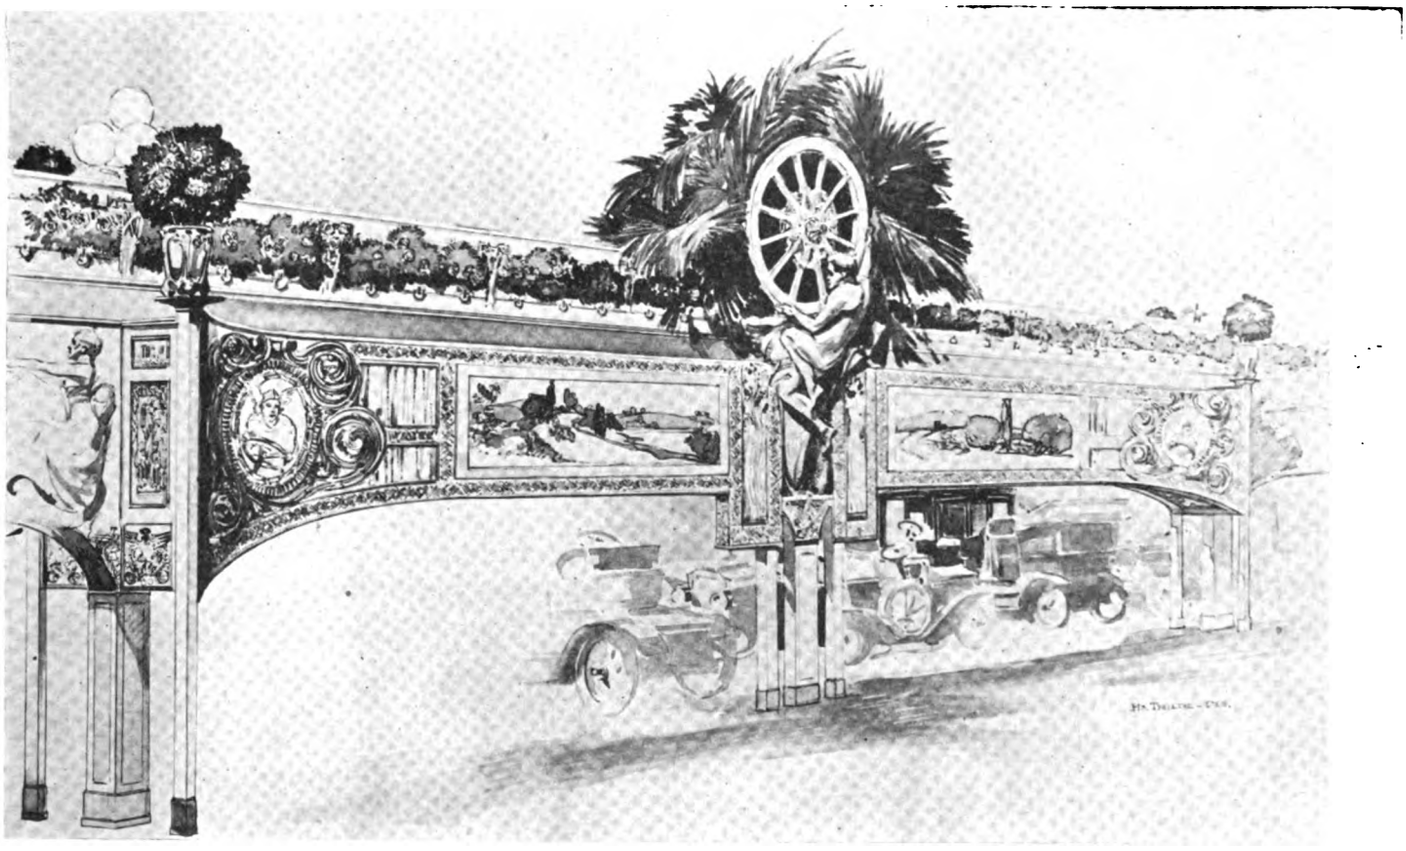
Locomobile Co. of America, Bridgeport, Conn., D-5—Locomobile gasolene cars.

Lozier Motor Co., New York City, H-2—Lozier gasolene cars.

Matheson Motor Car Co., Wilkes-Barre, Pa., G-1—Matheson gasolene cars.

Maxwell-Briscoe Motor Co., Tarrytown, N. Y., D-4—Maxwell gasolene cars.

Mitchell Motor Car Co., Racine, Wis., K-1—Mitchell gasolene cars.



National Motor Vehicle Co., Indianapolis, Ind., C-5—National gasolene cars.

Olds Motor Works, Lansing, Mich., F-3—Oldsmobile gasolene cars.

Packard Motor Car Co., Detroit, Mich., C-1—Packard gasolene cars.

Peerless Motor Car Co., Cleveland, O., A-5—Peerless gasolene cars.

Digitized by Google

SCHEME OF THE DECORATIVE ARCHES WHICH WILL DIVIDE THE EXHIBITS

Pierce Co., George N., Buffalo, N. Y., F-2—Pierce gasolene cars.

Pope Mfg. Co., Hartford, Conn., A-2—Pope-Hartford gasolene cars.

Premier Motor Mfg. Co., Indianapolis, Ind., C-3—Premier gasolene cars.

Reo Motor Car Co., Lansing, Mich., B-6—Reo gasolene cars.

Ricketts Auto Works, South Bend, Ind., L-1—Ricketts gasolene cars.

Stearns Co., F. B., Cleveland, O., B-5—Stearns gasolene cars.

Stevens-Duryea Co., Chicopee Falls, Mass., A-4—Stevens-Duryea gasolene cars.

Studebaker Automobile Co., South Bend, Ind., C-4—Studebaker gasolene cars.

Thomas Motor Co., E. R., Buffalo, N. Y., A-3—Thomas gasolene cars.

White Company, The, Cleveland, O., D-1—White steam cars.

Winton Motor Carriage Co., Cleveland, O., A-1—Winton gasolene cars.

Woods Motor Vehicle Co., Chicago, Ill., B-1—Woods gasolene and electric cars.

Coliseum Annex—First Floor.

Austin Automobile Co., Grand Rapids, Mich., O-2—Austin gasolene cars.

Chalmers-Detroit Motor Co., Detroit, Mich., M-1—Chalmers-Detroit gasolene cars.

Midland Motor Co., Moline, Ill., Q-2—Midland gasolene cars.

Oakland Motor Car Co., Pontiac, Mich., P-1—Oakland gasolene cars.

Pennsylvantia Auto-Motor Co., Bryn Mawr, Pa., Q-1—Pennsylvania gasolene cars.

Simplex Motor Car Co., Michawaka, Ind., N-1—Simplex 2-cycle gasolene cars.

Welch Motor Car Co., Pontiac, Mich., Q-3—Welch gasolene cars.

York Motor Car Co., York, Pa., O-1—York Pullman gasolene cars.

Coliseum—Basement.

Bendix Co., The, Chicago, Ill., 32—Bendix motor buggies.

Cameron Car Co., Beverley, Mass., 58—Cameron gasolene cars.

Clark-Hatfield Auto Co., Oshkosh, Wis., 51—Motor buggies.

Emancipator Automobile Co., Chicago, Ill., 15—Emancipator gasolene cars.

Grabowsky Power Wagon Co., Detroit, Mich., 40—Grabowsky commercial trucks.

Interstate Automobile Co., Muncie, Ind., 30—Interstate gasolene cars.

Mier Carriage & Buggy Co., Ligonier, Ind., 57—Motor buggies.

Randolph Motor Car Co., Chicago, Ill., 20—Gasolene cars.

Rider-Lewis Motor Car Co., Muncie, Ind., 24—"Excellent Six" gasolene cars.

Schacht Mfg. Co., Cincinnati, O., 16—Schacht motor buggies.

Thomas Motor Co., E. R., Buffalo, N. Y. 34—Thomas gasolene cars.

Thomas Motor Car Co., Owen, Janesville, Wis., 35—Owen Thomas gasolene cars.

Zimmerman Mfg. Co., Auburn, Ind., 1—Zimmermann motor buggies.

First Regiment Armory—Main Floor.

Anderson Carriage Co., Detroit, Mich., F-1—Detroit electric cars.

Anderson Carriage Mfg. Co., Anderson, Ind., E-1-1½—Anderson motor buggies.

Atlas Motor Car Co., Springfield, Mass., B-3—Atlas 2-cycle gasolene cars.

Auburn Automobile Co., Auburn, Ind., D-4—Auburn gasolene cars.

Berliet Import Co., Chicago, Ill., G-4—Berliet gasolene cars.

Black Mfg. Co., Chicago, Ill., E-4—Black motor buggies.

Buckeye Mfg. Co., Anderson, Ind., A-3—Lambert gasolene cars.

Brush Runabout Co., Detroit, Mich., H-1—Brush gasolene cars.

Cartercar Co., Pontiac, Mich., C-2—Cartercar gasolene cars.

Columbus Buggy Co., Columbus, O., B-1—Columbus electric cars.

Dorris Motor Car Co., St. Louis, Mo., B-4—Dorris gasolene cars.

Fiat Automobile Co., New York City, G-1—Fiat gasolene cars.

Fort Pitt Motor Mfg. Co., New Kensington, Pa., W-½—Pittsburg "Six" gasolene cars.

Gaeth Automobile Co., Cleveland, O., G-3—Gaeth gasolene cars.

Jackson Automobile Co., Jackson, Mich., A-4—Jackson gasolene cars.

Kimball & Co., C. P., Chicago, Ill., G-6—Bodies.

Kissel Motor Car Co., Hartford, Wis., A-1 Kisselkar gasolene cars.

McIntyre Co., W. H., Auburn, Ind., C-4—McIntyre gasolene cars.

Meteor Motor Car Co., Bettendorf, Ia., E-5—Meteor gasolene cars.

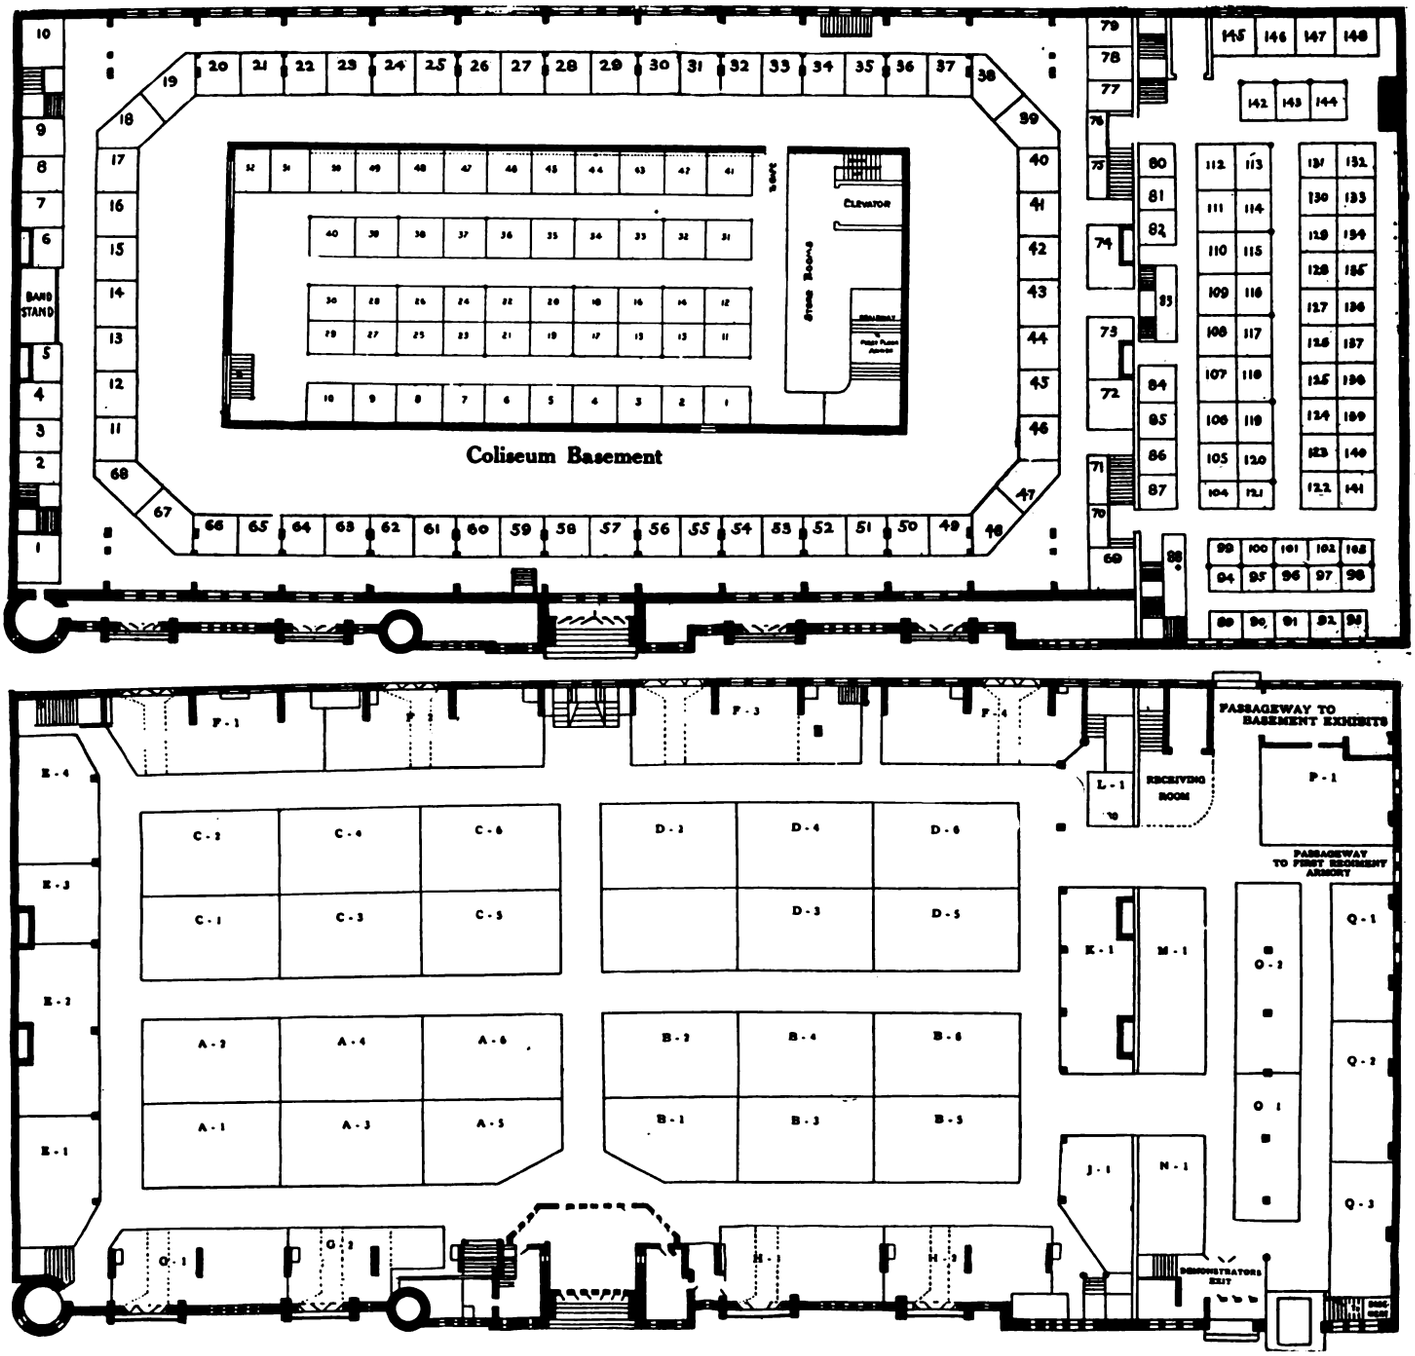
Model Automobile Co., Peru, Ind., F-2—Great Western gasolene cars.

Moline Automobile Co., East Moline, Ill., D-3—Moline gasolene cars.

Moon Motor Car Co., St. Louis, Mo., B-2—Moon gasolene cars.

Mora Motor Car Co., Newark, N. Y., D-1—Mora gasolene cars.

Nordyke & Marmon Co., Indianapolis, Ind., D-2—Marmon gasolene cars.



Overland Automobile Co., Indianapolis, Ind., C-1—Overland gasolene cars.

Rapid Motor Vehicle Co., Pontiac, Mich., E-3—Rapid gasolene trucks.

Rausch & Lang Carriage Co., Cleveland, O., G-5—Rausch & Lang electric cars.

Speedwell Motor Car Co., Dayton, O., A-2—Speedwell gasolene cars.

The Season of Local Shows.

The season of local shows now being well under way, announcements of these small reproductions of the great national events are constantly coming to notice. Among recent show datings are those of Portland, Ore., and Portland, Me., March 8-13 and February 22-27, being the days set; Baltimore, Md., February 24-27; Providence, R. I., March 1-6; Bangor, Me., February 15-20; San Jose, Cal., February 17-20, and Rochester, N. Y., March 2-6.

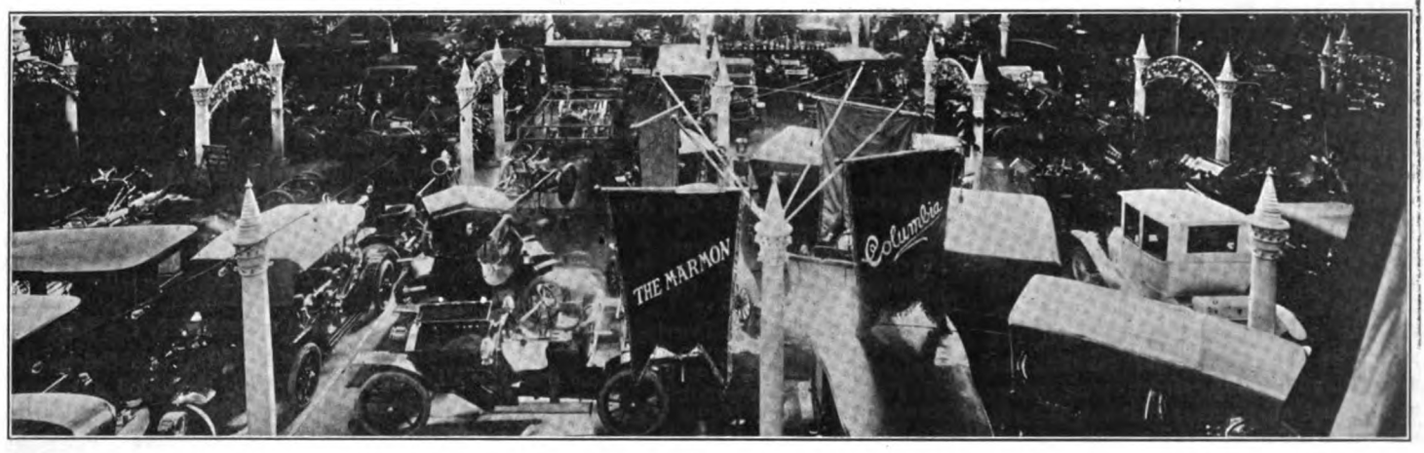
SHOW DAZZLES PHILADELPHIA



Picturesque Setting the Chief Novelty of the Big Display—Exhibits Include 150 Cars and Many Accessories.

An altogether unprecedented degree of prosperity marked the passage of Philadelphia's eighth annual show, which under the able handling of Manager Beck and his associates ran from Wednesday to Wednesday, Jan. 27th to Feb. 3d. Unusual in its mid-week commencement and ending, staged in a novel manner in a new location and with the additional floor space which the quarters in the Second Regiment Armory made available more than filled, it was a local show which its management well might be proud of. It was not without its embarrassments, however, as was discovered early in the season, when the many eager visitors who had "lotted" on seeing the moving pictures of the Vanderbilt and other famous contests, learned that they were to be deprived of the spectacle. It all came about through the efforts of the management to utilize all the space which the armory provided, for the purposes of the show proper. In consequence of this laudable desire, an adjoining vacant lot was requisitioned for the picture show and a huge circus tent erected. The first difficulty encountered was that of heating the extemporized auditorium to a degree commensurate with the demands of public comfort. The second arose when a high wind wrecked the tent on Tuesday night previous to the opening of the show. When it was found that it would be impossible to secure another which would be guaranteed to withstand the exigencies of winter weather, the idea of a supplementary entertainment under canvas was abandoned.

The circus tent effect was by no means lacking to the show despite this curtailing of its ambitious scheme. Indeed for the purposes of exhibition the interior of the armory itself was given the full semblance of a huge tent by the great masses of bunting which were festooned from the walls to the ceiling, where they were gathered up at the centre in a peak ornamented with a huge sunburst electrolier from which radiated strings of incandescent lamps. The color scheme of cerise and Nile green was effective—to say the least. The vivid background which it formed was somewhat toned down by the detail of the floor setting, however. This consisted in the marking off of the main aisle with a series of white pillars connected by arches over whch the golden grapes in plenty trailed in theatrical profusion, while at the posts which marked the separation between the various booths were other white posts, from which radiated light staves as from the ordinary back-yard variety of clothes pole. In this particular instance, the "wash" hung out to air comprised a series of very ornamental banners bearing in letters plain the names of the exhibitors.

VIEWS SHOWING THE NOVEL ADORNMENT OF THE SECOND REGIMENT ARMORY FOR THE PHILADELPHIA SHOW

As a show, there was practically nothing on view not already seen at one or the other of the two great shows of the season held in New York. Even the brilliant array of prize cups and other trophies, which figured at the Palace and Garden, were not lacking, and they made their mark with the visitors too. The floor space was divided into 39 spaces, while other exhibits were ranged about the walls and in the various ante-rooms of the building. The 60 different exhibits included no less than 150 cars, some 40 or more being gasolene, 5 steam and 2 electric. A dozen accessories stands were tucked away in convenient locations, while a lively corner of the show was given over to the display of motorcycles.

SHOW WEEK STIRS LOS ANGELES

Historical Pageant Precedes Opening—Nearly 100 Cars Brilliantly Staged Amid Elaborate Decorations.

Preceded by a lengthy parade which took twenty minutes to pass a given point, one which was supposed to denote the progress of transportation methods in America, Los Angeles's second annual automobile show was inaugurated with considerable pomp on Saturday evening, 23d ult. The doors of the big Hamburger building, where this year's exhibition held forth, did not open until the evening, the gigantic parade being the afternoon's "curtain raiser." The show continued all the week.

Headed by Show Manager Ferris, the procession traversed the principal streets of the city, and its novelty was such that it was little wonder that the show was crowded soon after the doors opened Saturday night. First in the line of march was a brass band, followed by a tribe of Indians on horseback to denote the method of transportation employed by the aboriginal tribes of North America. Next in the line of procession came an old canvas topped prairie schooner, followed by the historic Banning stagecoach, and an interesting array of old-time surreys, "democrats" and other early forms of horse-drawn vehicles. Several bicycles intervened between the horse vehicles and the section of automobiles, both of old and modern types, a presentation of an important phase in the evolution of the horseless vehicle which was fully appreciated by those who watched the pageant.

The show proper opened with the usual speech by Mayor Harper. Although in beauty and in the magnitude of exhibits this year's Los Angeles show far surpasses the exhibition of a year ago, the basement of the Hamburger building, at Broadway and Eighth street, was inadequate to house all the cars that might have been shown. Because they could not secure sufficient space several agencies held private shows in their salesrooms, among them being the Schwaebe-Atkinson Motor Co., with the Premier; the Big Four Automobile Co., representatives of the Marmon, Regal and Rapid, and the Renton Motor Car Co., agents for the Overland and Great Smith.

The decorating scheme was upon a far more elaborate scale than last year and completely disguised all evidence of the fact that the exhibition was held in the basement of the Hamburger building. The walls were lined with stucco work, embossed in winged automobile wheels, chauffeurs and chauffeuses in costume, automobiles and other appropriate designs, while white pillars, topped with large frosted globes, and festooned with natural greens divided the large hall into exhibition spaces. The floor was carpeted in green, while 12,000 frosted incandescent bulbs were deftly concealed in the ceiling and among the greenery. A great shell supported by urns was over the entrance to the facade, and over the latter an immense conchoidal, the interior of which was finished to represent the interior of an abalone shell, studded with vari-colored lights. At the foot of the stairs leading into the exhibition hall was an electric fountain, a lighting arrangement beneath a glass pyramid, giving the water the appearance of being on fire.

Of the 99 cars shown 92 were fully equipped for the road, the remainder being chassis. Of the total number 90 were gasolene cars; seven had electric power, and two—the White—use steam as the motive power. Accessories as shown by local agents and jobbers were in the usual generous proportions. The exhibitors of complete cars were as follows:

Auto Vehicle Co., Tourists, Reo and Kissel Kar.
Thomas Motor Car Co., Thomas Flyer.
H. O. Harrison, Peerless, Oldsmobile and Apperson.
Western Motor Car Co., Packard, Stevens-Duryea and Chalmers-Detroit.
W. F. Bush, Pierce-Arrow.
Buick Motor Car Co., Buick.
White Garage, White.
Maxwell-Briscoe Motor Co., Maxwell.
Standard Motor Car Co., Ford.
American Berliet Locomotive Co., American Locomotive.
Lord Motor Car Co., Studebaker and E-M-F.
Woodill Automobile Co., Haynes and Oakland.
Lee Motor Car Co., Cadillac.
W. R. Ruess Motor Car Co., Pope-Hartford.
W. K. Cowan, Rambler.
Lozier Motor Car Co., Lozier.
American Motor Car Co., American Traveler.
Duro Mfg. Co., Durocar.
Gregory Automobile Co., Moline.
Elmore Motor Car Co., Elmore and Baker.
William Bosbyshell, Dorris.
Roy Forsythe, Auburn.
Ralph C. Hamlin, Franklin.
R. H. Leavitt, Locomobile.
Stoddard-Dayton Motor Car Co., Stoddard-Dayton.
Charles H. Thompson, Jackson.
Greer-Robbins Co., Mitchell.

Private Shows in Chicago Auditorium.

Space limitations in connection with the allotment of locations to those desiring to exhibit at Chicago, have resulted this year as in the past, in the crowding out of one or two late applicants, with the result that they have had recourse to the establishment of "private" shows of their own. In this particular instance the hospitality of the Auditorium has been called upon to house two of them, and the many visitors at the show in the Coliseum who also patronize that spacious hostelry, will have ample opportunity to study the construction of the Columbia and Palmer & Singer cars, which thus will be displayed under exceptionally favorable circumstances.

CINCINNATI FLOCKS TO THE SHOW

Second Annual Exhibition Proves a Social Magnet—Many Well Known Cars Amid White and Gold Settings.

Cincinnati's second annual automobile show, which closed in the First Regiment armory Saturday last 30th ult. was responsible for many wearwell smiles that graced the streets of the Queen City this week. In fact, this year's show made last year's record of both actual and prospective sales appear insignificant in comparison. The Cincinnati Automobile Dealers' Association, under whose auspices the exhibition was held had decorated the immense drill hall lavishly, white and gold being the color scheme, and the armory was made the rendezvous for society, besides the object of attraction for many out-of-town dealers, with whom considerable business was transacted. Among the exhibitors were the following:

White Steamer Co., White; Jungclas Automobile Co., Mitchell; Cincinnati Automobile Co., Peerless, Pope-Hartford and Winton; Croethers Automobile Co. Royal Tourist and Elmore; George C. Miller Sons' Co., Stevens-Duryea; Hanauer Auto Co., Locomobile, Pierce Great Arrow and Corbin; J. H. Ratliffe Automobile Co., Chalmers-Detroit; Oldsmobile Co., Oldsmobile; Merchants' Garage Co.; Queen City Auto Co.; Stevens Automobile Co. Sid Black Automobile Co., Thomas, Franklin, Detroit, Electric and E-M-F.; Evanston Automobile Co.; Miami Vulcanizing Co.; American Motor Car Co.; Churcher Electric Co.; Coughlin-Davis Co.; Dealers Auto Supply Co.; F. J. Engert, and Special Motor Vehicle Co., Premier, Marion, Atlas and Maxwell.

Paris Salon a Possibility for 1909.

There may be a 1909 Paris Salon after all, despite the widely heralded agreement between a number of the more prominent French makers to the contrary. According to press despatches received this week, it appears that the notorious agreement, which was supposed to carry a heavy penalty for any party to it who should venture to display his product at the French capital before July, 1910, contained a joker clause in the shape of a proviso to the effect that it could be abrogated in case the English manufacturers could not be induced to follow suit. It is further understood that the committee of the Automobile Club of France is going ahead in expectation of holding the Salon next year as usual. All of which being so, it would further appear that the French manufacturers have succeeded in placing themselves in the enviable position of being able to show or not as they may see fit when it comes case in hand, and of standing on their dignity or as much of it as they can command, in either event.

THE PARTS MAKER

His Influence and the Responsibilities It Involves

Standardization, duplication, specialization. These three elements in the development of production are the stepping stones which lead to the goal of the excellent, low-priced and popular product. Because any single part of a machine can be produced better and more economically if made in quantities than if evolved by individual labor, and because these advantages accrue with the increasing adoption of automatic mechanical processes, the tendency of any industry is to concentrate upon the assemblage of interchangeable units which are applicable to a wide variety of purposes. Because the limits of specialization cannot be accomplished with the highest degree of success by the producer of the finished article, the tendency to concentration in time gives rise to the specialist in the production of components who forms an added link in the chain which stretches between the raw material and the finished product.

In any industry, these parts specialists constitute a powerful factor of industrial economy. But the danger that their function may be abused constitutes a huge menace to prosperity and to progress. According to circumstances, they exert either an elevating or a depressing influence on the industry. More truly than is generally appreciated, they exercise a guiding function in shaping the strength of the business to which they are allied.

Position of the Parts Maker.

Because of the complex nature of the automobile, the position of the parts maker has become particularly strong in this industry. Not only this, but the extremely rapid and impulsive growth which has characterized it has created a demand for finished components which is much greater, relatively speaking, than that of other lines. In consequence, the parts maker is to-day, one of the mightiest elements in the business of motor car production.

Upon the parts maker rests the burden of choosing whther his product shall be disposed of merely as so much stock merchandise, to be utilized by the purchaser as he may see fit, or whether it shall be employed in such a way as to insure reliability to itself and to the aggregation of which it is an integer. His responsibilities may be considered to go further than the details attendant upon the fabrication of the parts and the development of uniform quality and quantity adequate to the demand. They may be held to reach out into the shops of the assembler—the final producer—and require the placing of parts that are not simply up to the standard of uniform production, but which are suitable in every way for the purpose to which they are to be devoted.

This principle, of course, applies not merely to complete organs like axles, change speed gears, motors and ignition apparatus, but also to the smaller parts, such as bolts, rods, fittings, and minor attachments. Where simplicity and universality of application have made possible the acceptance of a general system of standardization, as is true in general of the smaller units as the test, the only opportunity of affecting the quality of the finished product lies in the choice of materials and, occasionally, in the thoroughness with which heat treatment may be carried out. But in the more complicated parts, such as the complete units, it is not sufficient to produce a good part, well designed, thoroughly built and properly put together. It must be assembled only in machines of such size that it is certain to be suitable for the work assigned to it.

Aspects of Quantity Product.

Whatever the origin or class of the parts maker, the tendency always is to quantity production, not only because big volumes mean extended profits, but because production costs are reduced as the turnover is increased. The successful parts maker is not simply a specialist in design, he is a specialist in construction. Beginning with a leverage on the market which may depend upon proprietary rights or upon geographical or mechanical advantage, continued experience develops a special aptitude in the performance of the limited series of operations which are involved in producing a small number of similar articles. The greater the number of parts produced, the better they may be made and also, the lower their actual cost.

Many familiar examples in plain arithmatic teach that where the tool cost on a certain job is $10,000, the pro rata charge on each of 100 pieces is $100; on each 1,000 it is $10; on each of 10,000, it is $1.

Thus with the increase in the number of duplicate parts produced, the only important variable item in the producing cost is proportionately sub-divided, and it goes on being spread out thinner and thinner to the ultimate limiting point, which is the life of the tools. Under ordinary circumstances, however, this is prolonged sufficiently so that the manufacturing cost continues to be reduced just as long as there is a demand for a given model. The attractions which a growing market for his wares holds out to the parts maker are thus very great, and the temptation to adopt the policy of building on a quantity basis alone, tremendous. Furthermore, as increases in quantity involve reduction in costs, the producer of large outputs is enabled to improve the quality of his product in precision as well as in general uniformity by the installation of improved machinery and tools.

It does not invariably follow, however, that the maker is willing to take advantage of the opportunity offered by a growing market to increase its quality or—what is of equal importance—to assure himself of its suitability for the work for which it is employed. Quantity production means cheapening the processes of manufacture. Cheapening in one direction, may, however, tempt him to cheapen in others; to reducing the quality of the materials employed, reducing weight, eliminating steps in the process of manufacture which may appear to be non-essential and finally in increasing the scope of the product's use without fortifying it properly to meet the additional requirements.

While thoretically multiplying the product may tend to improve it, it may, on the contrary, open the door to shoddy work and degeneration to a state of absolute unreliability. This is the great danger against which the thoughtful parts maker guards as against his own ruin. But perhaps a greater danger is that of attempting to accomplish too much with a single design. This danger is all the greater because the use of the parts is not entirely in his control, and because of the temptation to dispose of his product on a catalogue rating, leaving it to the assembler to determine how closely it fits his own requirements, and how well suited it is for his purposes.

Dangers of Multiplied Product.

A stock rear axle, for example, may be rated for horsepower up to 30, and may be of excellent design. In making the rating, the assumption is that the assembler will not design his car in such a way as to throw an excessive amount of weight on the rear, simply because that would throw more work upon the motor than it could comfortably handle. In the hands of experienced designers, therefore, the stock article is fairly safe with even so general a rating as this. But in the hands of a new maker, it may be overloaded, or equipped with improper spring suspension, or abused in any one of a number of other possible ways. The inevitable result of such treatment must be more or less unsatisfactory performance, and this, in turn, must reflect discreditably not simply on the faulty con-

Digitized by Google

struction of that particular machine and upon its maker, but also upon the entire product of the parts maker himself. As a result of improper installation in a single type of car, the reputation of that particular part may be jeopardized for all purposes and for all machines, even though in itself it may be well suited to the restricted purpose for which it was originally calculated.

The danger from improper use of otherwise valuable parts, however, is not confined to the careless or ignorant assembler. The advantages of multiple production appeal so strongly to the parts maker, that he is tempted strongly at times to increase the scope of his product by broadening its application. While with suitable methods of standardization this may be possible to a very wide degree, the over-eager parts maker may be led into the error of vending parts for uses to which he may be reasonably certain they will never properly apply. The careless parts maker is thus as great a menace to the industry at large as is the careless assembler to the parts maker. It is possible to double the output on a certain part by increasing the range of its nominal applicability. At the same time, unless the material is capable of withstanding all the stresses which it is possible to foresee, the advantages of the increased income from extra sales are liable to be offset by a corresponding loss in prestige when the product shall have seen a season or so of actual service.

The Maintenance of Prestige.

This evil, it lies within the power of the parts maker himself to forefend. With close attention to the field and a systematic method of administration in the sales department, it is possible to safeguard the product from abuse at the hands of the assembler, and this a number of stronger and better-equipped firms in the industry are now doing. Furthermore, that this method of handling the parts business has its own reward in upbuilding a solid reputation for the product is well illustrated in a number of typical instances where the maker is at some pains to watch the manner in which the product is handled after leaving his factory.

To take a remote instance, it is comparatively well known that the fame of the Lemoine axles which have figured for so long in French motor car practice, is attributable to the fact of their extreme reliability in service. That that reliability is due almost as much to the fact that the makers refuse to sell their parts without knowing exactly where and under what circumstances they are to be mounted, as to the excellence of the material employed, is not so generally appreciated. As a matter of fact, however, the would-be purchaser of these parts must assure the maker that his specifications are such as to suit the requirements of the product, before his order is accepted.

Similarly, a well-known American firm which caters exclusively to the assembling trade, producing no finished vehicles itself, issues a blank form of specification on request for quotations, which none but a competent engineer can fill satisfactorily. Furthermore, it is only upon receipt of these complete specifications of the machine including such apparently insignificant points as the sizes and types of the tires to be employed, the rates of vehicle speed contemplated and the general mechanical details of the chassis, that prices are issued. Then quotations are given for a certain equipment which is guaranteed satisfactory, only when employed under the conditions originally laid down.

In another instance, the importer and manufacturer of a line of fittings which enjoy wide use, insists upon seeing blue prints of the installation before coming to terms of sale, and further checks up all load strains and himself determines upon the sizes of his parts which are to be used before permitting a single shipment to be made.

Advantageous to all Concerned.

The advantages of such methods require no exposition. When the purchaser in addition to receiving a product whose maker he knows will stand back of it at all times, has the benefit of his advice in consultation, obtains his broad criticism of design, and finally is assured of as careful supervision in the production of the parts as is exercised in their sale, he gains a degree of confidence in his own product, be it wholly or only partially assembled, which enables him to do much more with it than if it were put together under slipshod and careless methods. Indeed, the very service of parts makers of this stamp to the assembler are well worth the high price which sometimes is asked by them for the partial product.

The term assembler is here used advisedly as applying alike to the maker who builds little or nothing of his car, or to him who actually produces 80 or 90 per cent. of it, but reasons that there is economy in buying certain components direct from a specialist. This latter class may be made to include practically all of the better known makers of high grade cars, and because of their success, the use of the term should carry no reproach. That the influence of the parts maker thus is felt in practically every automobile factory in the country is apparent. That it works no discredit to the finished car where both partial and final producer are actuated by a desire to follow only the lines of the best practice, is only sufficient evidence that the parts industry may be used to the upbuilding of the industry as a whole if properly guided.

Parts Maker's Influence Broad.

Indeed there is not a single branch of the industry which is not under dominion of the parts maker, and subject to his influence, be it good or band. In those instances where parts are sold on the open plan of a stock rating by power or weight of car for which they are adapted, the responsibility for their use, of course, rests solely with the purchaser. It is not the fault of the producer if the parts fail to come up to the expected requirements, when misused or misapplied. At the same time, the parts producer who continues to manufacture components, knowing that they may be subject to abuse at the hands of the purchaser, is working his own undoing. Even the machinist who builds merely to the specification of the car maker has it in his power to govern the use and in some cases even the design of the component to a certain extent and thus is a factor in the shaping of the final product.

The extent of this influence is not limited by the mere strength and suitability of the mechanical parts of the machine, but reaches out into the moulding of even the externals of the cars to a surprising degree. Trends observable from year to year in the changing shapes of mud guards, radiators, springs, tops and equipment in general are traceable directly to the activities of the specialists in those lines. The mystery of how a dozen makers may hit upon practically the same pattern in any of these particulars at practically the same time, becomes no mystery at all, but merely an example of creditable enterprise on the part of the manufacturers of components, when it is seen that these as well as other parts are purchased ready-made. Nor is the fact any reflection on the enterprise of the makers of the cars, since in many cases the result is even more successful and attractive than if the details had been wrought out by the factory designer. It is a happy circumstance that the parts maker, from his intimate knowledge of the problems affecting that particular part and his association with a large number of car manufacturers, acquires a breadth of appreciation which could be attained by no man compelled to cover the entire field of car design from his limited coign of vantage behind a drawing bench.

Some Present Tendencies.

Always, the parts makers are the exponents of progress in the industry, as of economy in its administration. Always their influence is manifest in practically all its ramifications, and always it works toward the advancement or retardation of the product from the standpoint of serviceability, according to whether the parts industry is governed by motives of straightforward business acumen or simple indifference to results. Just now its influence is particularly strong, as the production of low and medium priced cars is increasing, and with it the requirement of parts production on a large and economical scale. On this account the outlook for the producer of components is particularly bright, but his opportunity for influencing the quality as well as the quantity of the total output of cars is equally important.

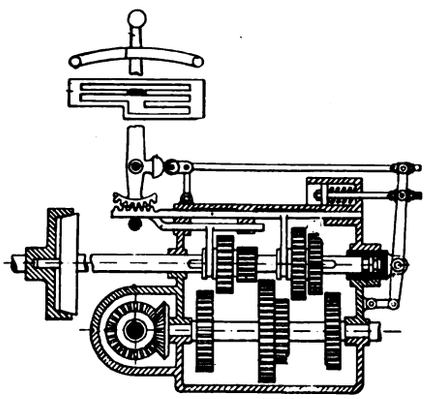
DEVELOPMENT IN CHANGE GEARS



Perhaps because the average motorist regards what is popularly known as the gear box as the transmission, and all the transmission there is in his car, he is unable to appreciate the difficulties attendant upon transmission design nor to recognize the advances which have been made in that puzzling subdivision of the evolution of the motor car. Frequently though the attempt has been made, it appears to be a practical impossibility to teach the man in the street that the term transmission includes the entire mechanism which connects the motor and the driving wheels, and all that is in any way involved in the communication of power between the source and its point of application. Nevertheless thus is the transmission defined, and when so considered, the crudest devices in present use are made to appear wonderfully successful, more especially when it is understood that they are called upon to perform a most intricate and trying function.

From the very earliest attempts at mechanizing the road vehicle, the question of varying the speed of the driving wheels at the absolute option of the operator was recognized as of almost as great importance as that of starting and stopping ability. With the steam-driven vehicle, this problem worked itself out readily enough. Where the internal combustion motor was involved, however, it was a very different matter. Consequently the problem then, as it does even in the present advanced stages of the art, presented one of the most difficult studies the designer has had to face.

The most elementary form of transmission mechanism available to the early constructors was the plain belt running over a pair of pulleys and tensioned by means of an idler held against the slack side by means of an arm. Varying the position of the arm, naturally varied the speed of the driven pulley within limits, because of the alteration in the belt tension. Releasing the tension to its limits, naturally provided means for stopping the vehicle whenever that might be required.

In the early Benz vehicles this plan was utilized, refinements adopted in these and their successors of other makes, including the use of stepped pulleys and so of varying ratios; numerous intricate systems of control, and finally, as the use of the belt alone began to be more or less deplored, even the use of spur and bevel gears arranged to be clutched or clashed together to produce varying speeds, but still with a belt as the main driving connector.

It must be borne in mind that the transmission change speed gear was clearly an innovation brought about by the adoption of the internal combustion engine. Cugno's steam vehicle—the earliest motor car of which there is authentic record—was driven directly, and others of the steam type also had more or less direct, but always inflexible connections between the prime mover and the wheels. On this account its development proceeded pretty closely along

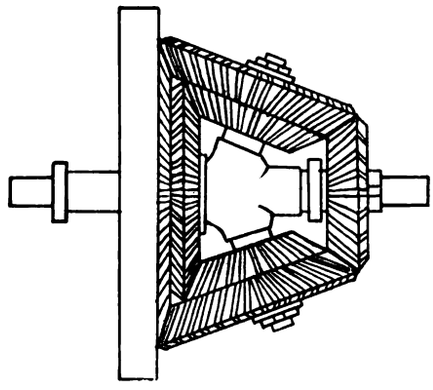
EARLY DAIMLER PATTERN

the lines of that of the gas engine as applied to automobile construction. In the early days, no divisional units were recognized and every part of each machine was built directly into the machine itself. Furthermore, as the pioneer constructors worked quite independently at first, there were as many different transmission systems on the early cars as there were motors, and as many different types of motor as there were cars.

It should here be noted that Gottlieb Daimler, whose success in building the first really successful type of high speed motor in connection with his experiments in automobile construction, also was indirectly responsible for the evolution of the first known example of the type of change gear to follow the general lines now accepted as common practice. Indeed, the early Cannstadt-Daimler transmission went a step further than to do the transmissions of the day in that it permitted absolute, single lever control together with selective operation of the gearset.

The general arrangement of the gearset, which is shown in the accompanying illustration, was that of a plain cone clutch driving a splined shaft on which were mounted two sliding sets of two gears each. The gears on the lay shaft below were fixed, and drove the countershaft through bevel pinions. Final transmission was through side chains after the fashion which later became universal. The method of actuating the gears was peculiar in that the movement of the gear shifting lever caused the clutch to be unseated whenever the lever was brought into the central or neutral position, the movement being brought about by means of a cam fixed to the lever and actuating a rod through which a rocker arm was made to pull the entire clutch shaft backward bodily and away from the fly wheel. By moving the lever transversely and drawing it into one or another of the three slots in the segment, a rack on the lower end of the lever was made to select the proper pull-out rod in order to mesh the desired sets of gears.

The method of clutch construction was the same as that later employed on the Panhard-Levassor cars, and continued up to within a very few years. As in the Daimler gearset, this system involved the use of the plain cone clutch, the lay shaft being below the driving shaft and transmitting movement directly to the countershaft. The Panhard type, however, instead of employing the two sliding sets, was progressive. That is to say four gears were grouped in a single unit, their diameters being so contrived that they meshed successively with their mates as the group was moved along its shaft. In this, then, the prototype of the second type of change gear in present use was developed.

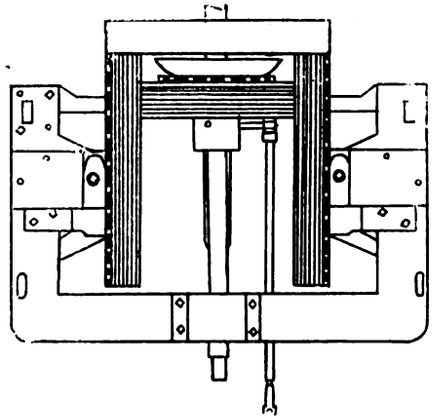


The line of evolution to the present day systems was not as direct as might be imagained from this superficial review, however. It has been observed that each of the early constructors worked pretty much alone. Therefore the automobile had long ceased to have been an experiment in the fullest sense of the word, before the process of borrowing ideas which in polite language is called standardization began to gather

Digitized by Google

headway. From the primitive belt, designers branched off in every conceivable direction, and to attempt to follow their eccentricities would in no sense be a means of tracing the development of transmission systems, however diverting it might prove. With a very few exceptions the earlier forms came to be merged in one of the two types already outlined. But here and there an idea cropped up which later became embodied in these same types and which led directly toward the styles in present use.

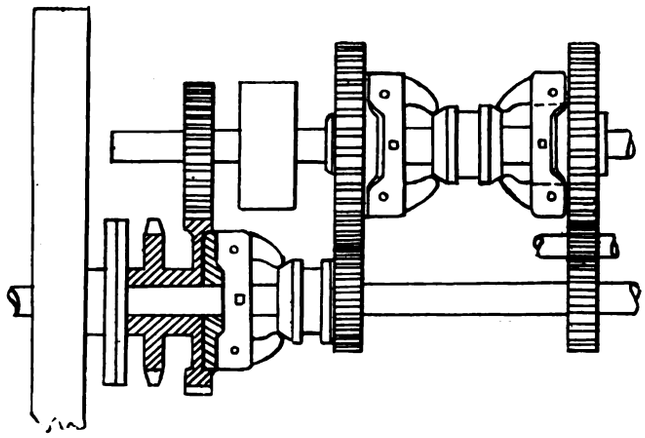
Thus as far back as 1898 appeared the Humpage epicycloidal gear in which a nest of bevel gears mounted on a central carrier member, were made to revolve about the axis common to two sets of bevels which faced one another but were mounted on the ends of independent shafts. The aggregation resembled the present form of bevel differential gear except that the floating pinions were not mounted at right angles to the main line of shafting. By applying a brake to a floating ring which was driven by the bevel pinions the nest was made to rotate about its axis, while the revolution of the pinions themselves caused the driven shaft to be actuated at a different rate of speed from that taken by the driver. Thus was conceived and put into operation the first recognizable type of planetary gear. Its development since that period has resulted in the use of spur instead of bevel members, and in a multitude of minor refinements which have not in the least altered the principle which was in the vision of the original inventor.



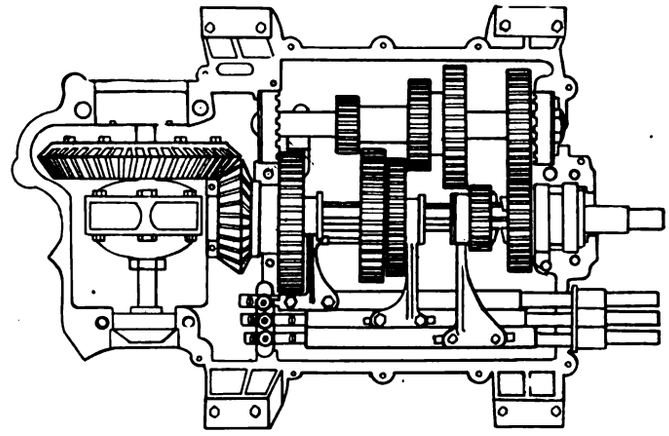
Another land mark in the late 90's was the construction of the DeDion voiturette, in which the single cylinder vertical engine was mounted under the rear seat while transmission was accomplished through short shafts running, one to either rear wheel and coupled through two universal joints. In this machine, crude as it was, appeared the first properly constituted rear axle drive of the floating type, and also the first system in which the change speed gear was incorporated directly in the driving mechanism at that point. Though the principle of the floating drive was here put into successful operation, it was not until some years later that the first of the true live axle constructions came into vogue, and

HUMPAGE EPICYCLOIDAL

then in the form of the revolving axle which was only superceded by the semi-floating methods of drive in the later developments which have taken its place during the past decade.



Another principle utilized in the early De-Dions which later found considerable favor with designers abroad, and also in America,



FRICTION DISC TYPE

was that of the individual clutch. The clutches employed in the type in question were of the expanding ring type, actuated by worm connections. This form, together with the plain cone, were most in use up to 1900, when other developments began to appear. With the beginning of the discussion of the relative merits of single and multiple clutches which later waxed so strong, the study of the clutch problem received an amount of attention which none of the designers had had liesure to give it up to that time.

In the early Haynes models which were the most successful of their immediate period were a series of stepped gears, each gear in one of the two intermeshing banks containing a clutch operated by means of a sliding key telescoped within the shaft. In the Winton car, however, which was in successful use for many years, another principle appeared as applied to the high speed member, in which two flat surfaces were pressed together with great force through the medium of toggle joints, the resulting friction effecting the desired driving relation. In this system may be discerned a logical forerunner of the plate clutch, and also of the multiple disc type, although the latter system was of foreign origin and is of later growth.

WINTON INDIVIDUAL CLUTCH

MODERN SELECTIVE TYPE

The sliding pinion method of change gear having been firmly established, and clutch design having been pretty well standardized, methods of mounting in the frame and of connecting the change gear group to the driving wheels began to be considered more seriously than before. The true shaft drive did not make its appearance until 1901 or 1902 and is therefore a comparatively recent development. As was the case with so many other systems which have since become crystalized into current practice, it was a foreign innovation and a legitimate successor of other systems—notably that of the old, belt-driven DeDietrich, in which a sliding change gear and bevel drive with shaft connection had been used for each of the driving wheels.

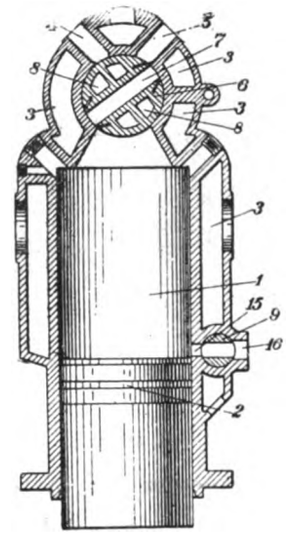
Change gear mechanisms in the early cars were found in almost every conceivable place from the fore part of the vehicle to the very rear where, as in the case of the DeDietrich system just referred to, the entire mechanism was mounted on an over-

Digitized by Google

hanging support at the rear of the car. With the beginning of the period of standardization, however, the central mounting came into favor, following the lead of the Panhard and Daimler builders, and with it the use of the sub frame for carrying engine and change gear groups became prevalent. In order to secure a proper length of driving chain, the position of the countershaft with respect to the back axle was relatively fixed, so that in machines of very long wheel base, it was sometimes necessary to separate the change gear and differential mechanisms. In other cases the same effect was secured by placing the entire group well to the rear and neatly concealing it under the body.

The introduction of the three-point suspension principle followed rapidly upon the conviction taking root that it was impossible to safeguard the entire chassis against weaving when in service, and with this, the idea of the unit mounting for the plant rapidly came into vogue. First the engine and change gear groups were kept independent and mounted on a sub frame which was distinctly intended to yield to frame movements without straining the parts which it carried. Later the principle of the complete unit was evolved.

Paralleling this development, and of a degree of importance which is unquestionable, came the introduction into general use of the axle-mounted change gear which was first successfully employed in this country during the year 1903, or thereabouts, and which has since been granted a continually increasing use in this country, though abroad it is still but little known save on American cars.



On the supposition that mechanical development of any sort must lead to a single ultimate conclusion where a given purpose is to be served, it appears that the development of the automobile tranmission must proceed further along one of four lines, or upon all of them, should it come to be considered that no single system is applicable to every type of motor vehicle. The four systems which may be considered as still in rivalry are the side chain and shaft drives; and the engine mounted and axle mounted change gear. In each case, cars are to be found which are built according to the best accepted practice in all other respects.

Still another system, which though successful in the products of a few makers is regarded with more or less suspicion by others, is the friction type, in which use is made of pure rolling contact instead of tooth contact as in the more familiar patterns. This is an altogether recent development along ideal lines, which has been questioned because, like all other mechanical novelties, it presents a host of unforeseen difficulties. As yet, its acceptance has not become sufficiently general to warrant its classification as a rival of the geared systems, though in many quarters it is regarded as likely to supplant them in time.

EVOLVING THE ROTARY ENGINE

Application of the Principle in the Frayer-Howard System of Valve Construction —The Patent Specifications.

It is a remarkable fact that despite the great amount of attention which already has been given the subject no thoroughly practical type of internal combustion motor having rotary valve construction has yet been put upon the market. Nevertheless, numerous efforts have been made in this direction, and it is known that more than one motor car builder has his eye upon designs which he is eager to put before the public

FRAYER-HOWARD ROTARY VALVES

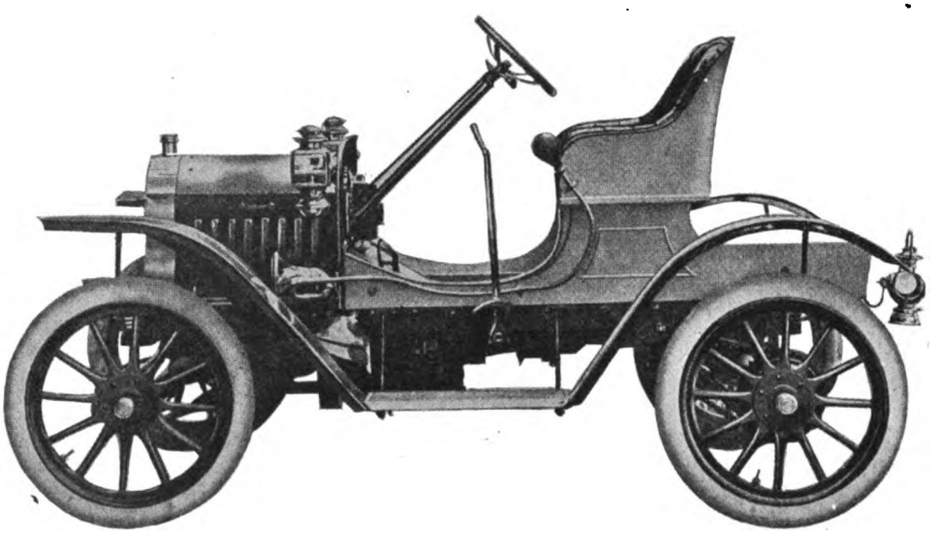
so soon as they shall have been proven practicable in the ordinary run of test practice. In this connection it is noteworthy that patents have been granted recently on a rotary valve construction which embodies at once a combined inlet and exhaust member operating in the cylinder head, and a supplementary exhaust port in the cylinder wall at the lower end of the piston stroke, regulation of the opening of this port also being accomplished by means of a rotary valve. The fact that the patents have been issued to Lee A. Frayer and Charles O. Howard, of Columbus O., gives some inkling as to what direction may be looked toward in expectation of possible future developments in this line

The construction involved is made plain by the accompanying illustration taken from the patent specifications and showing the arrangement called for in the second of the two patents mentioned, in which the principle of the rotary auxiliary exhaust valve is protected. The arrangement of the head end and ports is practically the same as in the first patent, and the principle of distribution involved is precisely the same. As will be observed from the picture the valve member forms a complete obstruction for both intake and exhaust ports, a diametrical port in the rotary part being arranged to register in turn with the cylinder head and one of the ports, a bridge between them and the other of the ports successively, in the course of each half revolution. The ports being arranged at an angle to the axis of the cylinder, it follows that the amount of angular movement of the valve in order to accomplish the distribution involved in the complete cycle is very small. Thus, 1 is the cylinder. 2 the piston, 3 the water jacket, 4 the intake port, 5 the exhaust port, 6 the valve proper having the open diametrical port, 7, and the cooling spaces, 8, for which provision is made in one of the claims allowed. The auxiliary outlet for the exhaust gases is provided at 15. where the valve 9 is made to register with the opening in the port twice for each revolution thus permitting the discharge of the waste products of combustion through the outlet 16, as shown.

While complete details of the method of safe-guarding against the escape of the gases at the ends of the valve are not given, it is specified that the valve is journaled adjacent to its ends in such a manner that it is kept out of contact with the walls of the valve chamber. It is further provided that suitable packing rings be mounted on the valve adjacent to the port for the prevention of leakage.

The patents, which are numbered 908,656 and 908,657, respectively, were filed September 12, 1907, and August 31, 1908, and were assigned, the former fully and the latter in one-third amount, to Moses W. Kouns, of Columbus. They were issued simultaneously under date of January 5, 1909.

The rotary principle always has been looked upon as the simplest conceivable method of controlling both inlet and exhaust movements of the cylinder gases with a single valve member. As presenting a simplification of the valve mechanism with but slight increase in the complication of the cylinder casting, it is a development very much to be desired were it possible to obtain it in practical form. Against the advantages which it brings, however, the designer must wrestle with the two problems of preventing leakage of the gases without at the same time imposing an undue amount of friction on the valve mechanism, and of providing adequate cooling means so that the valve shall not tend to clog itself under the influence of the high temperature in which it is forced to work. Hitherto these difficulties have proved more than the practical manufacturer cared to undertake in a design which was to be put into the hands of careless and inexperienced users



---

For remedying leaks in stuffing boxes of water pumps, asbestos string well coated with black lead will give excellent results. It will remain water tight longer than any other packing, insuring freedom from a leaking pump, and frequent renewal of the stuffing box packing.

Brush Runabout

$500——$550

The excellence of a car lies in how well it runs.

How well it runs is determined by *its design* and *the way it is made.*

The Brush is *well designed.* Brush did it. All of Brush's work has not only been successful, but has been particularly remarkable for durability and simplicity. That Brush in designing this car was two years ahead of the times is now shown by the fact that most of the biggest and most reliable French makers are this year showing models that look like plagiarism from the Brush Runabout, only less graceful in appearance and less thoroughly worked out.

The Brush is *well made.* For liberality of bearings, excellence of materials, fineness of limits and general carefulness in both work and material, we doubt that any car made excels the Brush.

Because of all these things, *the Brush Runabout runs well.*

That it *does run well* is learned not only from such things as the transcontinental trip, but more especially from the testimony of owners. Ask them.

One town of 1200 inhabitants has taken 22 cars since August. A western dealer who contracted for 100 cars in September for the coming year has already taken 51 of them. Another dealer who contracted for 200 cars in August has so far had 85.

From the standpoint of both owner and dealer, isn't this the kind of car to tie up to?

SMITH CONQUERS SNOW AND ICE

Marvelous Performance by Sole Survivor of Hartford-Pittsfield-Hartford Run—Four Daring Rivals Fail to Finish.

It is not likely that there will be any protest over the award of two cups to Ben Smith for covering 156 miles of snow and ice covered roads in Connecticut and Massachusetts on Thursday last, 28th ult., in a Mitchell roadster. Smith was the sole survivor of the endurance run from Hartford to Pittsfield and return via Springfield, promoted by a local newspaper with apparent small regard for human life. That every driver in the race was not killed or maimed was neither the fault of the promotors nor of the treacherous roads. Despite the fact that it was one of the most fatuous mid-winter contest ever promoted it does not, however, detract from the glory of Smith and his mechanician for guiding their sturdy car over well nigh impassable roads with death traps lurking at every turn. That any of the five starters managed to finish is marvelous.

Five drivers, in charge of as many cars, dabbled with death by starting from Hartford at 7 o'clock Thursday morning last, 28th inst. They were Lieutenant Herbert S. King, Maxwell; J. F. Humphreys, Holsman; F. L. Mills, Mitchell; J. F. MacDonald, Maxwell, and Ben Smith, Mitchell. Two test cars containing officials started but were soon put out of the running by mishaps.

The first leg of the course was to Canton, the next checking station being at Winsted, and Mills's Mitchell met with a mishap before reaching the latter place Mills had taken the wrong road out of Hartford and when he discovered his mistake returned to the starting point and tried to melt the snow in an effort to overtake the other competitors. An interfering tree caused a broken wheel, and after this was replaced it was so late that the car returned to Hartford after reaching Collinsville.

The entire run was a succession of accidents and hairbreadth escapes. Lieutenant King's car went out early on Avon mountain when it skidded into a ditch, and the other Maxwell, driven by MacDonald, first had axle trouble at New Hartford, and finally went out of commission, when it skidded, ran into a tree and broke a wheel at West Becket, Mass. It remained there over night and finally completed the course, but one day late and therefore out of the running for either of the cups offered. Morally it finished second, as the beautiful simplicity of the rules provided a minimum time limit of about eight hours and a maximum time limit from the start until doomsday. Humphreys was laid up with a mishap within a few miles of Pittsfield. One of the official cars jammed in the bridge just beyond Sheffield, while the other turned turtle near Stockbridge, throwing out the driver and referee of the contest.

Nor was the winning Mitchell without its share of thrilling incidents. Soon after leaving Hartford Smith got into trouble. He negotiated the slippery road up Avon mountain without accident, but in going down the other side the car ran onto a patch of ice that was obscured by snow. An uncontrollable skid and a telegraph pole beguiled fate and before they knew it Smith and his mechanic of the same name were lying in the road, the latter being wedged in between the car and the ground. F. A. Law came along in a big car and helped right the car, when it was found that the front axle was bent badly and the running board smashed to smithereens. Despite the dangerous wobbling of the front wheels Smith proceeded until he came to one of the official cars, jammed into a bridge near Sheffield. Smith hooked his Mitchell to the disabled car and tried to extricate it, but was unsuccessful and finally had to make a detour through the mountains into Great Barrington, for a loss of 15 miles. He reached Great Barrington at 10:23 a. m., and rolled into Pittsfield at 11:20, having covered about 90 miles in 4 hours 20 minutes. As his mechanician was slightly injured Smith stopped in Pittsfield long enough to have his helper fixed up and to eat dinner.

At Pittsfield Smith was urged to take the route over Peru mountain instead of attempting the dangerous ascent of Jacob's Ladder which, at its best in summer, is a heart-breaker in more respects than one. Smith, however, would not listen to counsel of the natives and said that he would take his car over the prescribed route or "bust." The ascent was a perilous one on low gear and several times the engine had to be cooled with snow, as the rear wheels spun around without resistance. Fortunately the ascent was made without accident and then began the descent, which was accomplished by binding rope to the rear wheels. From Chester to Westfield the run was over ties, on the road and through the snowbanks thrown up by the trolley sweepers, but Smith and his brave mechanic managed to reach Springfield at 5:10 p. m., where they were accorded an ovation. The homestretch run from Springfield to Hartford was made without incident, the latter place being reached at 6:52 p. m., Smith having been on the road 11 hours 52 minutes.

Automobiles Prompt at Fire Call.

The value of automobile fire apparatus was demonstrated to the satisfaction of the salvage corps in Newark, N. J., during the storm of Saturday night, 16th ult. Within a period of less than two hours the automobile of the corps responded to four alarms of fire, and proved its great superiority over horse drawn apparatus.

QUAKER CITY CONTEST CONTINUES

Three-Cornered Squabble Over Award—The Promoting Club Appeals from Decision of A. A. A. Contest Committee.

If ever was a muddled affair the three-cornered controversy now going on between the contest board of the American Automobile Association, the Quaker City Motor Club and the Premier Motor Mfg. Co., is entitled to the laurel wreath for being the most complicated. It all is over the result of the two days' endurance run promoted by the Quaker City Motor Club from Philadelphia to Wilkes-Barre and return, January 1st and 2d. The Premier company, on advice of the Quaker City Club which refused to entertain its protest, turned to the contest board with its petition for a reversal of the award. This was granted as was told in last week's Motor World, and the result is so distasteful to the members of the Philadelphia organization that an appeal has been taken to the executive committee of the A. A. A., claiming that the contest board was without jurisdiction.

In the protest of the Premier representatives it was pointed out that during the evening prior to the run a meeting was called to explain the rules to the contestants, and that R. G. Johnston, Philadelphia agent for the Premier, and McNamara, the driver, asked Dr. Overpeck if it would be permissible without penalty to unload passengers if it were necessary to secure traction. It is stated that Dr. Overpeck said this would be allowable, which statement, so far as is known has not been contradicted by the Philadelphia club.

It was during the second day of the run that the alleged infraction of the rules by the Premier car occurred. Before the Premier car began the climb up Giant's Despair a blockade of cars occurred. One of the blockading cars, according to the testimony, slipped one of its non-skid chains and started to skid down hill, so that McNamara for protection had to back his car down. Some of the passengers became frightened and got out of the car. McNamara then drove around the blockade and stopped as soon as he thought it safe, which was 25 feet beyond the last car. The passengers got in the car and it proceeded up the hill without trouble.

The protest of the Premier people came before the contest committee of the American Automobile Association on January 21st, and there seems to be considerable mystery surrounding this meeting. Those present were Chairman Frank B Hower, Frank G. Webb, E. P Chalfant, Alfred Reeves, appearing in the capacity of an advisory board. S. A. Miles, also a member, was unable to be present on account of illness. Others present were H. O. Smith with a lawyer, representing the Premier in-

Digitized by Google

terests; G. Douglass Bartlett, counsel for the Quaker City Motor Club, and Richard Sellers, chairman of the club's contest committee. The decision of the Philadelphians was reversed and the Premier car declared entitled to the trophy. It is not known whether this ruling was made by the contest board of the A. A. A., or whether it was Chairman Hower's individual ruling.

Although it refused to accept the protest of the Premier people and advised them to file a protest with the American Automobile Association, the Quaker City Motor Club refuses to abide by the decision of the contest board—or of Chairman Hower—claiming that the contest board of the American Automobile Association has no jurisdiction whatever over the interpretation and enforcement of rules for the government of the endurance run promoted by the Quaker City Motor Club.

The petition presented to the executive committee of the A. A. A. recited that the Quaker City Motor Club, as an affiliated club of the American Automobile Association, always has conducted its events in accordance with the rules of the racing board, which gave the affiliated clubs promoting endurance contests the right to make rules to govern them. That on or about December 3d, 1908, the Quaker City Motor Club had received notification from Secretary Elliott that the racing board had been abolished and its function vested in the contest board, but before receiving this notification the rules for the Philadelphia-Wilkes-Barre endurance run already had been formulated. No new rules for the conduct of endurance runs had been sent it by the contest board, and therefore it did not know that the latter had any jurisdiction whatever over endurance runs, but following a letter from Chairman Hower it applied for a sanction, which was granted.

The petition alleges that when the hearing was held in New York City Chairman Hower refused to hear argument on the question of jurisdiction of the contest board to reverse the decision made by the contest committee of the Quaker City Motor Club. Three days before the New York hearing was held the Quaker City Motor Club received a letter from Chairman Hower, the following portion of which is quoted in the petition to the executive committee: "If, however your club takes the stand that it cannot err in judgment and will not abide by the judgment of the contest board of the A. A A., there is no use of our going further into the matter, and to so state to the contestant protesting." It was after receiving this letter that the Philadelphia people decided to argue the question of jurisdiction but claim that their representatives were not allowed to bring up the point at the meeting. The latest reports from the City of Brotherly Love are to the effect that unless the executive committee of the American Automobile Association clears things up it will be less one large club.

ECONOMY TEST FOR GLIDDEN TOUR

Addition of a Fourth Trophy to Prize List —Best Showing in Fuel Consumption to Determine the Award.

For the first time in the history of the Glidden tour the feature of economy will enter into this year's contest, to be held next July, a cup having been offered by the Chicago Motor Club to the car making the best showing in the matter of fuel consumption. Heretofore it has been sufficient for competitors in the contest to make the controls on time and not to use any of the spare parts, and the introduction of economy will be a valuable as well as interesting phase of the forthcoming contest.

The idea of offering a cup for the car showing the best fuel consumption originated with David Beecroft, chairman of the technical board of the Chicago Motor Club and while in New York he held a conference with the Glidden tour officials, with the result that his plan was accepted. Thus fortified Beecroft returned to Chicago and brought the matter before the board of directors of the Windy City organization, which gave him authority to carry out his plans.

The trophy will be in the form of a cup, for which the members are now subscribing, and will make the fourth prize to be contested for in the 1909 Glidden tour, the other prizes being the Glidden trophy for touring cars; the Hower trophy for runabouts, and a trophy for miniature tonneau and double rumble cars, which is a new one, the name of the donor being withheld.

No formal rules have been adopted by the American Automobile Association to govern competition for the Chicago Motor Club trophy, but it is understood the plan to be operated will be the one successfully used by the Chicago Motor Club's 1,000 miles reliability run last year. The formula employed considered the weight of the car with load in pounds divided by the fuel consumption in ounces, which proved to be a satisfactory test in that it did not permit the carburetter to be adjusted for unusually close economy and at the same time allow the car to be able to maintain a close schedule.

Advocates Penalizing Tire Troubles.

In casting the rules for the forthcoming contest for the Glidden and Hower trophies, exception has been made of tire troubles in providing the list of penalizations. In the past it has been generally conceded that such an omission was justified since tire troubles, like poor roads, belonged to a class of evil to which all motorists fall heir with equal impartiality. The idea is gaining ground in some quarters, however, that the design of the car has more to do with the rate of tire wear than used to be imagined. Taking this view, H. H. Franklin, voices the opinion that the Glidden rules for 1909 ought to include penalizations for tire as well as other difficulties. For, as he points out, "tire troubles are the cause of 90 per cent. of the road stops of the average car."

"The man who is interested in automobiles and automobiling wants to know how much trouble he is likely to have with his tires as he does with any other part of the automobile," says Mr. Franklin. "In fact, he needs to be more certain of the tires, for when he is out on a run the first thing he knows he finds himself stranded with a flat tire, and he must wait for repairs.

"In contests like the Glidden tour penalties should be imposed for tire troubles. They are to a considerable extent the result of heavy construction, and poor material accounts for more. They should be judged like any other part of a motor car. For the endurance and reliability of the vehicle are dependent just as much or more, upon them as upon the various parts concerning which penalizations are scheduled.

"It might be a good plan to farther extend the scope of the list of penalties and make it cover batteries As in the case of the tires there is no reason for overlooking battery defects and failures while the perfection that endurance and reliability contests are intended to demonstrate is required of all other parts. Batteries are on the wane, magnetos taking their place, but if they are used they should be made to stand the test.

"The Glidden tour is a reliability test and an important one, and it is intended to demonstrate accurately how much trouble of any and every kind the motor cars entered have. If it fails to do this in any degree it fails to that extent short of its purpose.

"Those in charge of endurance tests have of late been working toward greater rigidity of requirements. They have been sending the contestants over hard roads, purposely chosen to secure the weeding out of as many entries as possible before the technical committee is asked to give a ruling. The time is not far distant when in competitions like this the whole structure of the automobile will have to show that it can stand the strain or a penalty be imposed for its defects."

Automobiles Again May Cross Frontier.

Automobiles from the United States may now get into Canada in the vicinity of Niagara Falls and baby carriages may do likewise, but horse-drawn vehicles will not be permitted to cross the border for some months to come. Last summer, on account of an epidemic of hoof and mouth disease among cattle and horses, an embargo was established by the Canadian authorities at the Niagara port, barring all vehicles and the order included automobiles. On January 4, however, that portion of the restriction relating to motor cars was removed.

INVITE CRITICISM OF TERRY BILL

Commissioners on Uniform Law Holding Series of Conferences—Objections to Absence of Speed Limit.

Far distant as the time may be when a majority of the important states will have uniform automobile laws, the efforts in this direction are being made with persistence, the campaign at present having its center in the sessions of the New York, New Jersey and Connecticut commissioners of uniform State laws who are meeting about once a week in an endeavor to reach a final agreement as to the exact provisions in the proposed law which they are to present to their respective legislatures. Last Saturday, 30th ult., another conference of this sort was held in New York City at the office of Charles Thaddeus Terry, who is chairman both of the New York board of commissioners on uniform state laws and of the legislative committee of the American Automobile Association. The lawyers participating in the conference were Frank Bergen, Woodrow Wilson and John R. Hardin, commissioners from New Jersey; Talcott H. Russell, Walter E. Coe and Erliss P. Arvine, commissioners from Connecticut; and William H. Hotchkiss and Francis M. Burdick, who together with Terry, represent New York State.

The basis of the deliberations was the bill drafted by Terry as the result of some two years experience in fighting for uniform automobile laws, the provisions of which were printed in last week's Motor World. While the features of the bill met with the general approval of the conferees, there was some discussion as to the provision abolishing "miles-per-hour" specification for city and country, respectively, some of the commissioners favoring limits of 12 miles per hour in the city and 25 miles per hour elsewhere, to meet the demands of legislators who insist upon definite speed limits. The bill as it stands at present provides that "No person shall operate a motor vehicle upon the public highways of this State recklessly or at a rate of speed greater than is reasonable and proper having regard to width, traffic and use of the highway, or so as to endanger property or the life or limb of any person."

"We are receiving and welcoming suggestions from every possible source," said Terry, after the conference, "and so far as we can judge public opinion from the many letters we get, the bill as it stands is almost ideal. When the commissioners agree definitely on its final form, it will be presented to their respective legislatures, and their duties as state officers will bind them to follow it up vigorously and try and secure its passage, a task which will be made easier through their official positions and the backing of their governors. Where the complete bill cannot be put through, such modifications in the existing law as will make the latter more nearly conform to it will be insisted upon.

"It will probably be necessary for us to hold several more conferences," he continued, "before we can all agree on the exact form the bill will take, but once we have reached such an agreement, the fight will be waged before the legislatures of the three states with all possible vigor. Meanwhile, we shall be glad to receive any criticisms of the bill that anybody may care to make. These criticisms may either be sent to my office, 100 Broadway, New York City, or to any of the other commissioners."

Proposed Exclusion Laws in Maine.

Maine legislators were called upon yesterday to consider the question of whether or not automobiles should be excluded from the precincts of Bar Harbor—sacred to the summer boarder—by the terms of a bill which has been filed at Augusta and upon which a public hearing was held. This is the first time the long fight between the wealthy summer residents of Bar Harbor, Southwest Harbor and Tremont and the automobile enthusiasts has been brought before the legislature. For four years, local restrictions have prevented the use of motor cars on three-quarters of the highways on Mount Desert Island, and also have prevented the entrance of machines from the main land. The present bill would exclude them etirely. Similar bills are being promulgated in two other instances—one in the case of Sullivan, which would isolate the summer resort of Sorento from the automobile nuisance, as it is locally regarded; and the other in the case of Solon, a little town in Sumerset county, well inland, which would exclude machines from the town except on three days a week.

Mellen Wants Automatic Speed Checks.

Massachusetts is wrestling with the old problem of the feasibility of regulating the speed of motor cars by means of automatic self-stopping regulators. A bill providing for such restriction, but not specifying exactly how it shall be brought about, has been introduced in the House by Representative Mellen, of Worcester, upon his own petition. The bill provides that when such an attachment shall have been approved by the board of highway commissioners, all automobiles shall be equipped with it at the owner's expense.

Bill to Authorize Insurance of Automobiles.

A bill at present before the Maine legislature is intended to extend the privileges accorded to insurance companies authorized to do business within the state and enable them to insure automobiles. It authorizes them to insure automobiles under such form of policy as may be agreed upon between them and parties insured.

OVERHAULING FRELINGHUYSEN LAW

Three Bills Embodying Radical Amendments Before the New Jersey Legislature—Scope of Proposed Changes.

After a prolonged preliminary campaign lasting over many weeks, the fight of the New Jersey motoring interests for less drastic legislation, reached a climax when, on Tuesday of this week, February 2d, Col. Austin Colgate, personal aid on the staff of Governor Fort, introduced in the House of the Assembly the amendments to the odious Frelinghuysen law, as drawn up and approved by the New Jersey Automobile Trade Association and the Associated Automobile Clubs of New Jersey, and endorsed by the Newark Board of Trade. The measures are embodied in three separate bills.

One of the propositions is for a ten day privilege to automobilists from other States without a local license. This, however, will be amended in deference to the wishes of Senator Frelinghuysen by making a nominal license fee of $1. Another bill makes it a misdemeanor for any person to operate an automobile while intoxicated or in wilful violation of the automobile registration laws, and a third fixes a penalty of $10 for failure to display a white light at night visible in all directions at least 250 feet.

A general synopsis of the proposed legislation reveals amendments to the present law to the effect that every motor vehicle must have a plainly audible signal trumpet; must carry exhaust pipes directly parallel to the ground or turning slightly upward; that the commissioner of motor vehicles shall receive all complaints for violation of the speed laws, the same to be in writing and verified.

Such complaints shall be investigated within 30 days from receipt, and if in his judgment a case is made out, he shall cause a warrant to be issued and placed in the hands of the officer to execute. The party so summoned shall be brought before a justice of the peace in the municipality in which the violation occurred.

It further forbids the use of a muffler cut out in cities or towns or within 500 feet of another vehicle; changes the speed limit to thirty miles per hour, and exempts drivers from penalties regarding maximum speed limit unless the excessive speed shall be proved to have been made for one full mile.

The proposed legislation provides that any person driving a motor vehicle without the positive consent of the owner, or while in an intoxicated condition, or for any debt or wager, or for the purpose of breaking any speed record, or after his license has been revoked, or failing to display his registration number, shall be guilty of a misdemeanor.

TIMKEN PRODUCTS

were represented at the Madison Square Garden Show, New York, by over **70%** of the exhibits of the American Gasoline Pleasure Car Builders, and by EIGHT of the NINE Commercial Car Exhibits. AN ENVIABLE RECORD.

Timken New One-Piece Pressed Steel Power Axle

561 A—Fixed Hub Type. Front View

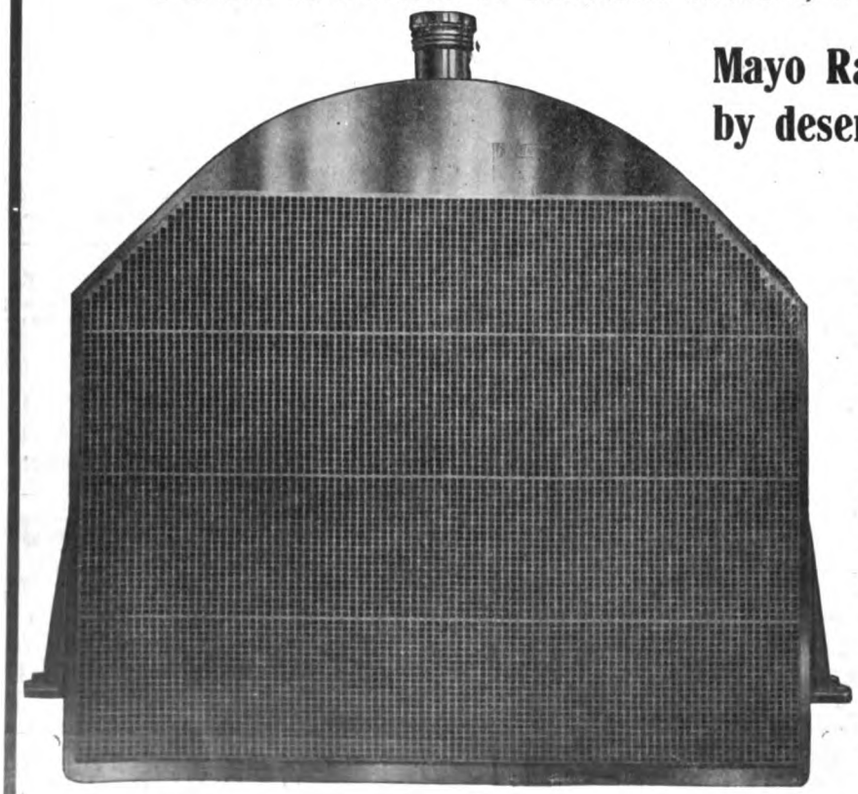
561 B—Fixed Hub Type. Rear View

as shown in the illustration herewith, is a one-pieced, pressed steel form, shaped to give better than truss resistance to load, end thrust and breaking strains, and eliminate the vibration common to cast steel or forged axles of the built-up type.

562—Floating Hub Type. Top View

The entire housing is a load bearing and gear-encasing member in a single unit, clear and smooth, without angles or protruding parts, supports or braces, with nothing to vibrate, nothing to rattle, nothing to work loose, nothing to catch mud and easy to clean.

The power unit (differential bearings and adjustments for same, pinion shaft and bearings, drive and pinion gears) is a compact unit that can be removed bodily from the axle case or housing without taking down the axles or disturbing brake equipments, springs, hubs or bearings.



The Axle complete with differential gear carrier, brakes and spring seats is made in both clutch and fixed type hub for cars weighing from 1,500 to 3,000 pounds empty, and 45 h. p. or less. See these new Axles at the Timken Exhibit at the Shows, or write direct for illustrated descriptive matter.

TIMKEN PRODUCTS will be exhibited at the Chicago Show, February 6th to 13th.

THE TIMKEN ROLLER BEARING AXLE CO., Canton, O., U.S.A.

BRANCHES—10 E. 31st St., New York. 429 Wabash Ave., Chicago.

'Tis not in mortals to command success, but we'll do more—deserve it.

Mayo Radiators have achieved success by deserving it, and in no other way.

¶ Therefore that success is presumably of the permanent and abiding kind.

¶ Price is the cause of the absence of MAYO RADIATORS from cheap cars.

¶ Quality is the reason for the presence of MAYO RADIATORS on most of the good cars.

¶ The only argument against MAYO RADIATORS is their price.

¶ Every other consideration dictates their use.

¶ MAYO RADIATORS combine sound mechanical principles, exact design, construction and workmanship, together with graceful appearance and perfect finish; in short, all the good qualities that go to make the ideal radiator.

¶ MAYO RADIATORS are stamped with the hallmark of class.

¶ MAYO RADIATORS are really the thoroughbreds of the radiator world.

¶ MAYO RADIATORS are made in the kind of a factory that befits them and by the MAYO RADIATOR COMPANY, at New Haven, Connecticut.

Solar

The Value of Perfect Lighting Equipment

cannot be overestimated. When touring at night, it becomes the most important part of your entire equipment. The comfort, pleasure and actual safety of every motorist depends on the efficiency of his lamps.

SOLAR LAMPS

are without question the best lamps made. They are absolutely correct in design. No solder is used in their manufacture. They are constructed of the best material money can buy in the largest lamp factory in the world. From every standpoint they represent perfection in motor car lamps!

Unless your car is equipped with Solars you do not possess perfect lighting equipment!

Interesting Information for you, Mr. Dealer

We have formulated a proposition which will enable you to represent us as agents for the Break Circuit Auto Lock, with practically no investment on your part.

If you are in the Accessories or Automobile business write us on your own letter head and we will send you full information which will be extremely valuable to you. Every automobilist wants a Break Circuit Auto-Lock and there is no reason why your house should not furnish him with what he wants.

ENDED

No more trouble operating the Gabriel Horn. The single tube Horn has always worked perfectly; some users, however, have heretofore experienced some trouble with the valve which operated the Horn. This is all changed in our new 1909 Valve. It works perfectly, warranted to never get out of order. Each operation removes all carbon deposit. Will not stick under any conditions. The valve can also be used for cut-out purposes by removing disc in main channel, thereby relieving back pressure from muffler.

The 1909 Gabriel Horn

still retains its supremacy as an Automobile signal. Many improvements in latest model.

Write for booklet describing products.

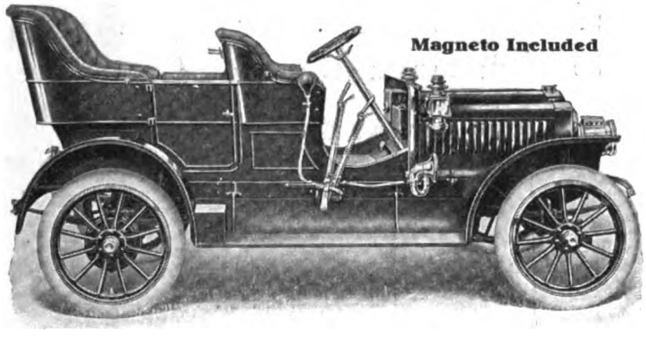
Five Were MAXWELLS Out of the Entire Field of Ten Cars—Think of What This Means—

In the Women's Endurance Run to Philadelphia and return, January 11th and 12th, the Maxwell entries **alone,** totalled up to as many cars as **all** other competing makes combined. Of course, every Maxwell finished — but that's not the point.

Why is it that the

"Maxwell"



Perfectly Simple—Simply Perfect

so far outnumbered all others.

It is simply because, "What Every Woman Knows" who drives a Maxwell—that her's is a car upon which absolute dependence can be placed—so simple and easy to handle that it is the logical car for the woman, and the man too, who wants motoring with the trouble left out.

Today 12,000 Maxwell owners prove our claims -- that though moderate in price, Maxwell cars are made of as high grade material and workmanship, under as rigid inspection and are as durable as should be the best, high priced car.

Our catalogue explains the Maxwell features that have built Maxwell success. May we send you this and other literature?

Matheson

At the CHICAGO SHOW

examine the duplicates of the three winning 4-cylinder Matheson cars which finished in FIRST, SECOND and THIRD time places, against a field of 32 CONTESTANTS in the severest ENDURANCE CONTEST ever held in America, over the ice and snow covered mountain roads from Philadelphia to Wilkesbarre and return, 300 MILES, January 1 and 2, 1909.

These three Matheson cars have been driven by their owners 7,000, 12,000 and 18,000 miles respectively, before entering this contest.

"The most difficult, hazardous, even dangerous endurance run ever held in America." — *Philadelphia Public Ledger.*

THE ART OF THE SPECIALIST

finds its fullest expression in the new

Baldwin Improved Detachable Chain

Absolutely correct mechanically, it is made exactly to scale and can be depended on under all conditions of service.

The detachable feature of the Baldwin Chain is an improvement of note. It may be run at the highest rates of speed without the separating of the clips shown at "B." These clips can be removed and replaced without injury, and as easily as the cotter pin. We furnish with each chain a tool shown in "C" for removing the clips, which, while not absolutely necessary, facilitates removal and replacement.

Pat. Oct. 27, '08.

DISTRIBUTORS THE SIMPLEX.

The Warner Auto-Meter

1909 Style

Guaranteed
Absolutely Accurate

is the only speed indicator made on the Magnetic Induction principle. Because of the principle it accurately indicates every range of speed from zero to the maximum.

All other instruments are made on the centrifugal principle. They fail to indicate any speed whatever under 5 to 10 miles per hour.

The Auto-Meter is so durably made that practical tests have shown that it will endure a **MILLION MILES** of riding without perceptible wear, or departing from absolute accuracy more than **10 feet to the mile.**

We invite comparative tests. Before you decide on any Speed Indicator, put the Auto-Meter on one side of your dash and any other indicator at any price on the other. Then use your watch over a measured course. Keep the instrument which **tells the truth.** We know which it will be.

SUPPLEMENTARY SPIRAL SPRINGS

¶ If every driver had to ride in his own tonneau, every car would be quickly equipped with Supplementary Spiral Springs. Owners are not intentionally selfish—many of them just thoughtless. Usually driving or sitting beside the driver, the riding qualities of the tonneau are to them practically unknown.

¶ Not so with the passengers. Rear springs must be strong enough to resist severe shocks under a full load. That means stiff springs under ordinary loads, with the shocks and jars transmitted to the passengers—guests whose comfort ought to be a first consideration.

¶ SUPPLEMENTARY SPIRAL SPRINGS take up all the average bumps and road inequalities and come into real action with the jolts and jars encountered at speed.

¶ With the S. S. S., your springs never whip or touch. They prevent breakage and are the most economical and useful accessory ever provided for a car. Every live dealer carries them and their attachment is a matter of a few hours' time. Do it NOW.

SUPPLEMENTARY SPIRAL SPRING CO.

Motor Mart, New York — 4555 Delmar Ave., St. Louis, Mo.

Full 18-20-Horse Power

For Speed—Dependability—Economy Under all Conditions of Weather—Hills—Mud and Sand—With no Experience necessary YOU CAN BANK ON THIS CAR.

Stearns

GOOD design; a careful selection of scientifically tested materials; the exercise of greatest care in the manufacture of component parts; painstaking skill in their assembly, and a system of final inspection so comprehensive and complete that anything under 100 per cent. perfect cannot get through—that's Stearns production.

¶ Our new 15-30 is for those who would have a strictly high quality car at price and of power somewhat under the 30-60 horsepower model.

¶ Catalogued at 15-30 it develops close to 40 horsepower and, while of comparative light weight, is so staunch and sturdy that it will "stand up," as a good car should, even under unusual conditions of service.

¶ And, like our 30-60 (which is accepted as the standard of excellence in America), this new 15-30 model represents extreme high quality in every line and fiber.

¶ It is shaft drive, and designed to accommodate town and touring bodies.

¶ In our 30-60 horsepower model purchasers are given side chain or shaft drive option.

¶ Demonstration by appointment.

This Tire Will Give You The Best Service

There may be other tires on the market that probably look from outside appearance to be as good as the G & J, but if you will get sections of the different tires and compare the quality of rubber, its toughness, and the manner in which it is embedded into the meshes of the fabric you will note there is a difference. After making this comparison and also noting carefully the general construction, you will not wonder why so many are specifying G & J Tires.

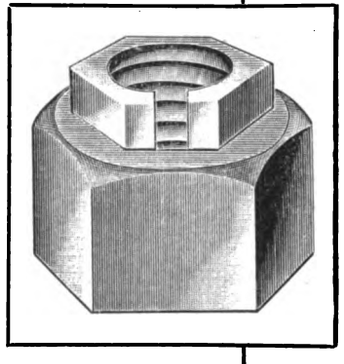
"Locking the door after the pony is stolen"



is a good deal like postponing the use of

Columbia Lock Nuts

Now

for it's only a postponement at best. Why not take a double-twist on the forelock of old Father Time and incorporate the use of Columbia Lock Nuts in your construction BEFORE you have occasion for regrets? Columbia Lock Nuts are in general use and are regarded as a necessity by some of the biggest railroad systems in the country. They ought to be a double necessity on automobiles. They are already used by many prominent makers. They should be used on every automobile everywhere.

¶ Columbia Lock Nuts simply cannot work loose. Vibration, even the constant vibration of solid tires, cannot affect or loosen them. They are automobile insurance of the very best kind and their cost is not a factor. Let us prove our case.

THE SELDEN CAR

MADE BY

"The Father of Them All"

One Price, $2,000. F. O. B. Rochester.

TOURING CAR, ROADSTER, TOY TONNEAU

A genuinely good car cannot be made and sold for less than $2,000. By this we mean a car like the Selden, containing nothing but the best of materials, workmanship and finish. A car that the manufacturer can stand behind and guarantee for at least a year against any imperfections in workmanship or material.

We buy only the best materials, employ only skilled labor and pay particular attention to details and finish, thereby producing a strictly high-grade car at the lowest possible price.

The up-keep and maintenance of a medium-priced car like the Selden is within the reach of any man of moderate means and the value of the car does not depreciate like that of the lower priced cars. This is the point to be considered by every purchaser.

The Selden Car is a 4-cylinder 28-30 horsepower (developing 37 horsepower) five passenger Touring Car or three passenger Roadster, with 114-inch wheel base, 34-inch wheels, shaft drive, selective control, pressed steel frame, metal body, fully equipped.

Superb riding, roomy tonneau, luxurious upholstery, smooth running, great hill-climber, flexible and easily handled, economical in maintenance and up-keep, fine finish, stylish and attractive.

THE MEASURE OF TIRE QUALITY

is not alone length of service, but also kind of service.

A tire that has to be coaxed by frequent visits to a repair shop is an inferior tire, even tho it may last a total of three, five or seven thousand miles.

MORGAN & WRIGHT TIRES

are long-lived tires, but the length of service is secured in the making of the tires, and and not by frequent doctoring by the users. They stand up as only tires can that are made as Morgan & Wright tires are. And our rigid system of inspection protects you from any and all possible defects.

Barthel & Daly,
42 Broadway,
New York, N.Y.

Gentlemen:-

Early last Spring we received from you a partial set consisting of two #315, and #306 and one #308 Schafer Annular bearings.

These bearings were used on the writer's six-cylinder car, #315 bearings being used carrying the load on the rear axle, and one #306 and one #306 being used in one of the front wheels.

They were run about 1800 miles in the car above mentioned, and were afterward put in the Premier Company's Hower entry which received a perfect score in the Glidden Tour, this car being driven by the writer. This Tour included the drive back to Indianapolis, giving us 2400 miles additional.

On returning from the Glidden, these bearings were again put into the writer's personal car for further test.

They were recently taken out and examined after having had a total mileage of about 7000 miles and were found in thoroughly good condition.

We have looked well into the question of material and workmanship of the Schafer bearings, and this in addition to the larger number of balls than are used in the average annular bearing probably has a great deal to do with the very excellent showing which these bearings have made.

Yours very truly,

PREMIER MOTOR MFG. CO.

$1,500 For A Car

Embodying $11,000,000 Worth of Experience!

There are two kinds of cars:

One is made merely to sell at a low price. The other is made to give service; is mechanically correct; is constructed of the best material, and is sold at a modest percentage of profit over the cost. That is the Mitchell $1,500 car.

The manufacturer's experience; his reputation, and a large plant can alone guarantee a good car at a low price.

We buy and make on a large scale. We can turn out a car at a figure wholly prohibitive to the small maker.

$11,000,000 worth of Mitchell cars have been giving complete satisfaction for eight years.

Our plant is now four times as large as it was when we started to make these cars.

Our $1,500 car is perfect all the way through, down to the smallest details. We wouldn't use more care or better material in its construction if we asked twice as much for it. In it is crystallized all our eight years' experience.

Mitchell

New Model 30 (1909 model) including High-Grade Magneto—32x4 in. tires—assuring freedom from tire troubles and $300 worth of actual extra Automobile value which you can get in no other car of its price. Touring Car or Roadster—price,

$1,500

A big, roomy, luxurious 5-passenger touring car, with 4 cylinders, 28-30 horse power engine and capable of doing 50 miles an hour. This is our Model 30 which we offer you for $1,500.

We even go further than this. We include $300 worth of actual automobile value which with any other $1,500 car you would have to buy extra.

For instance our price includes a high grade magneto in addition to the regular battery ignition system.

It includes 32-inch wheels and 4-inch tires—all other $1,500 cars use 3½-inch tires. Our tires cost us $50 more per set than the 3½-inch tires.

It includes a dozen other features which you would expect to find only in cars selling for $5,000 or more.

Our transmission is of the best selective, sliding gear type—the kind that is used in all of the well known, high-priced cars.

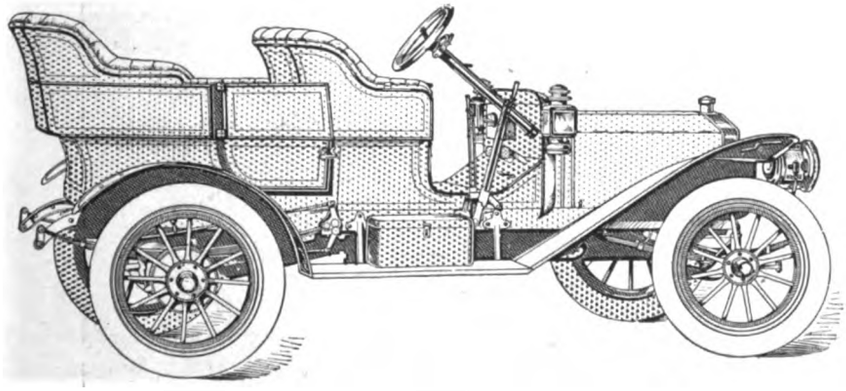
Our cylinders are cast separately.

We use as much vanadium or nickel steel as the most expensive cars on the market.

We use aluminum castings wherever possible and we strengthen them with bronze.

Our tonneau is detachable, and you have your choice of three styles of body.

Two complete ignition systems—Magneto and the ordinary battery system.



The lubricating system is the best we have found in our eight years' experience.

If we were not equipped to turn out ten cars to the other makers' one, this Mitchell "30" would certainly cost you $2,000 to $2,500.

Remember that we do not buy parts from separate makers and simply assemble them. Such cars are experiments—each individual car is an experiment.

But we are able to machine our parts to the accuracy of ~~10000~~ part of an inch. So our car is in harmony at every point. It is silent and smooth and reliable. Don't take our word for these facts. Examine the car yourself; ride in it, give it the hardest try-out you know. Then, if it doesn't "make good," don't buy it.

Full particulars upon request.

MITCHELL MOTOR CAR CO.

THE MARMON

"A Mechanical Masterpiece"

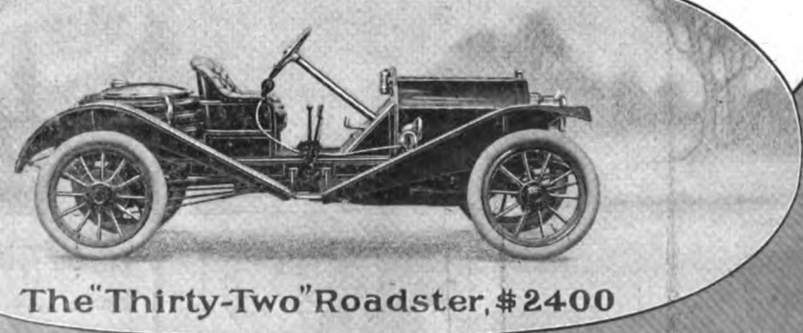
The "Thirty-Two" Suburban, $2400

Certainty, Not Supposition

A man's record can't be written at his birth. Neither can you correctly judge the durability and value of any make of car except by reviewing its past.

The Marmon cars sold by us in the early days of the automobile industry are still giving splendid service. Time has wrought many refinements in design. But the vital elements of durability and reliability have never been lacking in a Marmon car.

The "Thirty-two," manufactured entirely by us, and unsparingly equipped, has a character and a value which no thoughtful buyer can ignore.



Motor, 4 Cyl. 4½x4½. Water cooled. 32-40 H.P. Three point support. **Ignition,** Bosch H. T. Magneto, dual system. **Lubrication,** Marmon system of automatic force feed through hollow crankshaft. **Drive,** straight line shaft. Selective transmission and rear axle one compact unit, very accessible. **Large** brakes, effective and very durable. **Materials,** absolutely the best of everything, including Krupp and Chrome Nickel Steels. Hess-Bright imported ball bearings. **Tires,** Q. D., 34x4. **Wheel Base,** 112 in. **Weight,** 2,100 lbs. **Equipment,** complete and high-class. **Bodies,** Sheet Metal. Touring Car seats five; Suburban (detachable tonneau) seats four; Roadster seats two. Also furnished as Coupe or Limousine Town Car.

Marmon "Fifty" (Seven-Passengers), $3750

TIMKEN PRODUCTS

were represented at the Madison Square Garden Show, New York, by over **70 per cent.** of the exhibits of the American gasoline pleasure car builders, and by EIGHT of the NINE commercial car exhibits. AN ENVIABLE RECORD.

TIMKEN

New One-Piece Pressed Steel Power Axle

Fixed Hub Type—Front View

Fixed Hub Type

Brake

Fixed Hub Type—Rear View

Floating Hub Type—Top View

as shown in the illustrations herewith, is a one pieced, pressed steel form, shaped to give better than truss resistance to load, end thrust and breaking strains, and eliminate the vibration common to cast steel or forged axles of the built-up type.

The entire housing is a load-bearing and gear-encasing member in a single unit, clear and smooth, without angles or protruding parts, supports or braces, with nothing to vibrate, nothing to rattle, nothing to work loose, nothing to catch mud, and easy to clean.

The power unit (differential bearings and adjustments for same, pinion shaft and bearings, drive and pinion gears) is a compact unit that can be removed bodily from the axle case or housing without taking down the axles or disturbing brake equipments, springs, hubs, or bearings.

The axle complete with differential gear carrier, brakes and spring seats, is made in both clutch and fixed type hub for cars weighing from 1,500 to 3,000 pounds empty, and 45 h. p. or less. See these new Axles at the Timken exhibit at the Shows, or write direct for illustrated descriptive matter.

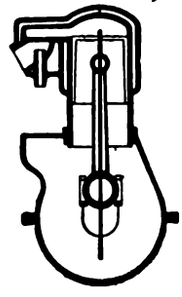
Rambler

The Car with the Offset Crank Shaft

Model Forty-four, 34 H. P., $2,250

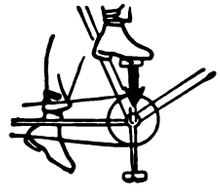
Spare Wheel, with inflated tire, brackets, and tools, $74.

Magneto, $150.



Why the Offset Crank-Shaft?

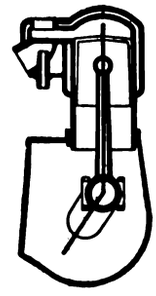
Notice a man about to mount a bicycle. He always adjusts the pedal in that position where it will receive to best advantage his full weight on the first downward stroke. This position for the pedal is just slightly forward of the center of the crank-shaft of the bicycle. If he mounted when the pedal was directly over the center of the crank-shaft, his weight would fall directly on the bearings and the first downward stroke would be retarded and therefore weak.



Now imagine the man's leg as the piston of an automobile engine, the pedal of the bicycle as the crank-pin, and the crank-shaft of the bicycle as the crank-shaft of the engine. In the ordinary engine the crank-pin and piston (the pedal and the man's leg) are directly over the dead center, and until the crank passes the turning point all effort is wasted. Thus when the explosion occurs the greatest force falls upon the bearings.

In the Rambler engine, at the instant the explosion occurs above the piston the crank-pin has moved past the dead center; the crank-shaft is in a position to receive the full pressure and turns without friction. No shock falls on the bearings; there is no side thrust, and wear on the cylinder walls is thus saved.

Because of this feature Rambler Model Forty-four can be operated smoothly and steadily at three miles an hour on high gear



Ordinary Engine. Position of piston at explosion center.

Corresponds to position of piston in ordinary engine at explosion center.

Corresponds to position of piston in Rambler engine at explosion center.

Rambler Offset Crank-Shaft. Position of piston at explosion center.

Seven-passenger model, 45 horsepower, with offset crank-shaft, $2,500. Other models $1,150 to $2,500. A new Rambler catalog has just been issued. It describes and illustrates all distinctive features of new Ramblers--the offset crank-shaft, Spare Wheel, straight-line drive, etc. A copy on request.

THE MOTOR WORLD

Volume XIX. New York, U. S. A., Thursday, February 11, 1909. No. 20

MAKERS ELECT A NEW PRESIDENT

Smith Chosen to Succeed Briscoe at Annual Meeting of A. M. C. M. A.—Standard Warranty Adopted.

In the First Regiment Armory, Chicago, the annual meeting of the American Motor Car Manufacturers Association was held on Tuesday, 9th inst., resulting in the election of Harold O. Smith, president of the Premier Motor Mfg. Co., as chairman for 1909. The other officers elected were: Vice-chairman, C. G. Stoddard, the Dayton Motor Car Co.; treasurer, S. H. Mora, Mora Motor Car Co.; secretary, G. Vernon Rogers, Mitchell Motor Car Co.; and auditor, W. H. Vandervoort, Moline Automobile Co. The three members of the committee of management whose terms expired were re-elected. These are Charles Lewis, Jackson Automobile Co.; W. C. Marmon, Nordyke & Marmon Co.; and W. H. Vandervoort, Moline Automobile Co. Alfred Reeves continues as general manager of the association.

After serving for two terms as chairman of the Association, Benjamin Briscoe declined the honor for 1909, but will remain a member of the committee of management. He was given a rising vote of thanks for the excellent administration of affairs during his term of office, and a committee was appointed to secure some suitable testimonial token to be presented to him in appreciation of his leadership. The same committee was also empowered to make similar presentations to James Couzens, of the Ford Motor Co., who was the first chairman of the association, and to the members of the show committee, consisting of H. C. Smith, S. H. Mora and R. M. Owen, as a compliment to their success in conducting the last Grand Central Palace show.

A standard form of guarantee, to be known as the "A. M. C. M. A. warranty" was adopted, and legislative, racing and patent matters were made the subject of general discussion. In recognition of the importance of the attendance of dealers at the automobile shows, a resolution was adopted asking that the Chicago show management present to all automobile dealers offering proper credentials, a complimentary badge for the show period.

New Company Absorbs Wray Pump.

The Wray Pump and Register Co., of Rochester, N. Y., has been merged into a new company which will be known as the Kellogg Mfg. Co. In addition to pumps and registers, the new concern will manufacture a number of other specialties, including timers, all of them being the inventions of George W. Kellogg, the president. J. F. Weller is vice-president and secretary, and M. R. Anstice treasurer, while A. Byron Schuyler will supervise the manufacturing end.

More Recruits from Carriage Makers.

In addition to the Jewel Carriage Co. and other Cincinnati carriage concerns already announced as engaging in the automobile business, two new recruits have been added to the ranks. The Frank J. Enger Carriage Co. has embarked in the manufacture of high wheeled motor vehicles while the Haberer Carriage Co. has undertaken to make machines of the more conventional type. This part of the Haberer business is named the Cincinnati Automobile Co.

Mitchell Now a $1,000,000 Corporation.

A raise in capitalization has been made by the Mitchell Motor Car Co., of Racine, Wis., the increase being from $500,000 to $1,000,000. It is the intention of the company to make large improvements in its plant during the coming year. All of the wooden buildings in connection with the big factory are to be replaced with concrete structures.

Maxwell-Briscoe Adds a Factory.

The Maxwell-Briscoe Motor Co. has leased the Ingersoll-Rand Drill Works, at Tarrytown, N. Y. It is being equipped as an addition to the present Maxwell factories.

MUST PAY FOR USING TIRE MOLDS

Owners of Patent Notify Tire Makers to Secure Licenses—Prosecution for Infringement the Alternative.

While manufacturers of tires heretofore have had to do chiefly with litigation or rumors of litigation involving the principles of their wares, a number of them at least have received a departure from the usual course in the form of notification that they must either change the method by which their tires are made marketable or secure a license for continuance of such method.

This situation has been brought about by patent No. 822,561, issued June 5, 1906, to Peter D. Thropp, which is claimed to cover the manufacture of molds for curing tires in open steam. The De Laski and Thropp Woven Tire Co., of Trenton, N. J., is the owner of the patent No. 822,561, as they are the people who are serving the notices of infringement. They are, of course, acting under the authority of the exclusive licensee for the manufacture of the molds under the patent, John E. Thropp's Sons Co., of Trenton.

So strong are the tire company's representations that after some negotiations five rubber companies already have taken out licenses for the manufacture of tires by the use of these molds. Licenses to other companies will not be withheld, provided the same conditions are complied with as in the case of the present licensees, but warnings have been issued that all concerns making, using or selling the molds without license will be prosecuted.

Hardy Opens a Chicago Branch.

The R. E. Hardy Co., of New York, has opened a branch office in the Fisher building, Chicago, Ill., in connection with the Motor Parts Co., New York, of which Hardy is president. The sales of Sta-Rite plugs and automobile accessories will be handled in the West from Chicago.

Digitized by Google

In the Retail World.

The Woods Motor Vehicle Co. has opened a new garage at 1508-10 Benson avenue, Evanston, Ill.

The Belleville Auto Co. has opened an establishment at 228 West Main street, Belleville, Ill. G. G. Behrens is in charge.

Fire in the garage of the Canada Cycle and Motor Co., Ottawa, destroyed five automobiles. The loss is estimated at $30,000.

Nash & Fenimore have started in business in Los Angeles, Cal., and will handle Loziers. A garage location has been taken at 2414 West Seventh street.

A. C. Burton & Co. is a new firm in Houston, Tex. Its garage will be located at 812 Fannin street, and the concern, in addition to carrying a full line of supplies, will have the Chalmers-Detroit agency

Sperling & Triplett took possession of the Medsen garage, 327 West Broadway, Council Bluffs, Iowa, on January 1. They will handle the Detroit Electric, Jackson and International cars and deal in supplies.

James Matthews, of Alva, Okla., retired hardware merchant, will shortly open a temporary garage. He has started the construction of a cement stone building on Choctaw street, which will become his permanent headquarters upon completion.

The Chester Car Motor Co., of Nashville, Tenn., has taken over the business of the Southern Automobile Co., of the same city. The latter company was founded in 1904, with Duncan F. Kenner at its head John W. Chester is president of the new concern.

The Ottawa Motor and Cycle Company, Ottawa, Ill., will soon replace its present quarters in that city with a two-story concrete block structure. Samuel and E. K. Bonnefoy, proprietors of the concern, will branch out into the automobile business more extensively.

J. P. Schneider opened his new garage at Woodward and Bagg streets, Detroit, Mich., with social ceremonies on the afternoons and evenings of the 29th and 30th ult. There were floral adornments, vocal and instrumental music, and a great gathering of prominent people.

Saul Levy, formerly with the Philadelphia Auto Tire Repair Co., has become the manager of the Philadelphia Rubber Tire Co., with headquarters at 680 North Broad street, in the Quaker City. The sole agency for Trojan clincher and solid tires has been obtained, and the company has installed a first class shop for tire repairs.

The Peck estate interest in the firm of Peck & White, carriage and automobile dealers in Taunton and Fall River, Mass., hasbeen sold to Robert Powers, for fifteen years the manager of the firm s Fall River house. The deal involves ownership in all lands, buildings, stock, etc., held by the firm in both cities and also the automobile agencies.

Pierce Arrow cars, which have not been represented in Cleveland, O., for the past season, are to be handled in that city by a newly formed company, the Western Reserve Motor Car Co., having headquarters at 5017 Euclid avenue. The officers of the concern are C. J. Whipple, president and general manager, and John H. Price, secretary.

The Heaney Automobile Co. is to open in Aberdeen, S. D., about March 1, with one of the most complete salesrooms and garages in the territory. In addition to a local agency, the concern plans to distribute machines through the State. Its organizers are A. P. Heaney and O. A. Palmlund, of Olivia, Minn., and A. J. McMichael, of Minneapolis.

H. E. Fredrickson, Sidney L. Edholm, William F. Kemp and Thomas Bromwell have filed articles of incorporation of the H. E. Fredrickson Automobile Co., of Omaha, Neb., which is to have a capital stock of $100,000. Fredrickson, who has executed a $100,000 bill of sale conveying all his personal interest in the business, is president, while Edholm is secretary and treasurer.

Robbins Brothers, proprietors of the Oxford automobile stables in Lynn, Mass., now located at 197 Broad street, will move to a new building which is to be put up for them on property just bought by L. D. Robbins at 156 Broad street. The structure as planned, will be three stories high, of fire proof construction, and wil contain elevators, turntables and a double set of entrances and exits.

President James A. Ratcliff, of the Auto Motor Car Co., Cincinnati, O., has filed suit on behalf of himself and other minority stockholders asking an accounting and the appointment of a receiver. He alleges that Reuben S. and John Payne, as majority stockholders, have sold the company to the Sid Black Automobile Co., in which he is of the opinion they hold stock, and that the sale is to the disadvantage of the minority interests.

On the first of the vear the Powell Automobile Co., of Omaha, Neb., changed its name to the Powell Supply Co and on that date moved from 2010 Farnam street, where it had been for the past year, to 2020-22 Farnam street, where it has three times as much floor space. The old name was regarded as a misnomer, as the company went into the automobile supply jobbing business exclusively over a year ago, and is not handling cars of any make.

The Inter-Mountain Automobile Co., recently formed at Boise, Idaho, with a capital of $25,000, has elected the following officers: President and general manager, J. D. Moore; secretary and treasurer, George Green, cashier of the Bank of Commerce; vice-president, C. W. Wayland. These officers, with J. D. Lamb, of Walla Walla, and J. A. Fennell, of Boise, constitute the board of directors. The company soon will open a garage on Tenth street.

The Week's Incorporations.

Detroit, Mich.—Michigan Auto Parts Co., under Michigan laws, with $50,000 capital.

Racine, Wis.—Mitchell Motor Car Co. increases capital from $500,000 to $1,000,000.

Chicago, Ill.—Standard Automobile Supply Co., The, under Illinois laws; increase of capital from $10,000 to $30,000.

Newark, N. J.—Auto Renting Co., under New Jersey laws, with $25,000 capital. Corporators—R. C. Best, J. S. Kinsey and O. E. Jackson.

Chicago, Ill.—Roos Automobile Co., under Illinois laws, with $5,000 capital. Corporators—H. D. Roos, F. E. Matthews and H. C. Bangs.

Ayer, Mass.—Reliable Auto Co., under Massachusetts laws, with $25,000 capital. Corporators—E. O. Proctor, president; W. L. Preble, secretary.

Chicago, Ill.—Emery Motor Livery Co., under Illinois laws, with $50,000 capital. Corporators—W. W. Dixon, Adolph Lindholm, W. S. Jameson.

Dallas, Tex.—Buick Automobile Co., of Dallas, under Texas laws, with $50,000 capital. Corporators—W. J. Mead, F. W. A. Vesper and Oscar Morris.

Albany, N. Y.—Interborough Auto 'Bus Co., The, under New York laws, with $15,000 capital. Corporators—J. A. Oaks, Joseph M. Oaks and Daniel T. Casey.

Philadelphia, Pa.—Dependable Auto Tire Co., under Delaware laws, with $1,000,000 capital. Corporators—F. R. Hansell, G. H. B. Martin, S. C. Seymour, Philadelphia.

Cleveland, O.—Motor Improvement Co., under Ohio laws, with $70,000 capital. Corporators—C. D. Chamberlain, Albert L. Talcott, Warren C. Platt, W. C. Lytle and F. W. Baltz.

Chicago, Ill.—Merchants' Automobile Co., under Illinois laws, with $50,000 capital; to manufacture or sell automobiles. Corporators—John C. Sumpner, John W. Wikgrin and Andrew J. Burkman.

New York City, N. Y.—Barnes-Curtiss Co., Inc., under New York laws, with $25,000 capital; to manufacture, rent and repair automobiles. Corporafors—H. B. Barnes; H. B. Barnes, Jr., and A. L. Curtiss.

Fort Wayne, Ind.—Fort Wayne Automobile Co., under Indiana laws, with $10,000 capital; to buy and sell automobiles and supplies. Corporators—Cecil E. Gibson, Chester W. Warren and Newell H. Motsinger.

Rochester, N. Y.—Kellogg Manufacturing Co., under New York laws, with $25,000 capital; to manufacture tire pumps, gauges and specialties. Corporators—G. W. Kellogg, J. F. Weller, M. R. Anstice, Rochester.

Buffalo, N. Y.—Auto-Car Manufacturing Co., The, under New York laws, with $50,000 capital; to manufacture motor vehicles. Corporators—John B. Pierce, Chicago; George W. Atterbury, George D. Pratt, Edward B. Green, George H. Frost, Buffalo.

GERMANY AS A POSSIBLE MARKET

Some Conditions that Conspire Against the American Car—How It Might Obtain Better Recognition There.

As an outlet for American automobiles Germany is neither awaiting expectantly and eagerly for them, nor, on the other hand, is it indifferent and unresponsive if given the necessary business attention, according to Robert P. Skinner, consul-general at Hamburg. In his report as to the conditions under which American cars would have to compete in Germany, he gives informing data of the prevailing system of handling cars.

"The general reduction in the retail price of cars," he says, "has brought many buyers into the market, and nearly all good makes are represented. A few American automobiles have been sold from time to time, but as the manufacturers have made no persistent effort to sell their machines, they cannot be said to occupy any recognized position in this market. The reproach is constantly made that extra parts cannot be obtained readily, and as there are 7,000 separate elements in an automobile, that carries weight with a customer. Besides, local dealers in automobiles state that American cars are in disadvantage against those of European make in so far as the latter arrive here by rail entirely mounted —that is to say, the "chassis," whereas the body (carrosserie) is generally supplied by a local carriage builder. Automobiles from America, however, generally arrive here knocked down, and all the many single parts are carefully packed in crates and boxes, so that it requires several days' labor to mount the car. To secure a proper hold in Hamburg it will be necessary for American firms to establish a department where a full line of extra parts can be obtained at all times, to advertise extensively, and to prepare for two or three years of preliminary work before expecting much in the way of results.

"American automobiles were the first to appeal to the public on the ground of cheapness At present competition is severe, and all the famous makers are turning out attractive and serious cars at low prices, while high-priced cars have fallen generally in price.

"Retail agents in Hamburg and vicinity get a manufacturer's commission of 15 per cent., and sign a contract not to cut prices. A list of automobile dealers in Hamburg, which the consul-general states are reliable, may be obtained by the motor trade from the Bureau of Manufactures at Washington."

Friedenstein's English Company Fails.

Liquidation proceedings have been brought against the South British Trading Co., London, of which Joseph Friedenstein was the principal stockholder and managing director, and which handled several American accounts. Friedenstein was at one time in business in New York. Associated with him in the British enterprise was W. H. Wells, formerly of Brooklyn. The assets of the company now in the hands of the liquidator are estimated at £4,663 and the liabilities at £10,745.

Brown-Lipe Not to Make Axles.

Absolute and unqualified denial is made by the Brown-Lipe Gear Co., of Syracuse, N. Y., that the company is to engage in the manufacture of complete automobile axles. The report is declared by Manager H. W. Chapin to be entirely wrong, it being stated that the concern has no intention of going into competition with the axle manufacturers, but will content itself with its well established lines of equalizing, steering and transmission gears for motor cars, and special gears and sprockets.

Gabriel Horn Abandons Direct Sales.

H. Nelson Dunbar, the new sales manager of the Gabriel Horn Mfg. Co., Cleveland, O., is carrying out important changes in the sales methods governing the Gabriel horns and shock absorbers. Sales direct to the consumer will no longer be made, except in rare instances, and agents are being appointed in the various cities and towns, on whom the responsibility will devolve to see that the Gabriel products are properly installed on the owners' cars.

Hagstrom Increases Capital to $150,000.

Increased capitalization has been given the Hagstrom Bros. Mfg. Co., Inc., of Lindsborg, Kan., which makes inside blow out patches for automobile service. The stockholders voted to increase from $50,000 to $150,000, and elected officers as follows: President, William Hagstrom; vice-president, N. J. Thorstenberg; secretary, Emanuel Hagstrom; treasurer, Gustaf Hagstrom.

Continental Opens a Chicago Branch.

A Chicago branch for the Continental Caoutchouc Co. has been opened at 1412-1414 Michigan avenue. It will take care of the Continental tire business heretofore in the hands of the Excelsior Supply Co., and will cover the states of Indiana, Illinois, Wisconsin, Kansas, Minnesota, Mississippi and Kentucky.

Reo's Canadian Factory May Move.

The branch Canadian factory for the manufacture of the Reo cars is reported as about to move from Windsor, Ont., where it was recently started. St. Catherines, Ont., is given as the new location.

Allen Resigns Taxicab Presidency.

Harry Allen has resigned as president of the New York Taxicab Co., of New York City. His resignation occurred on Tuesday of this week.

HUMBER ON FINANCIAL SHOALS

Stockholders of Famous British Concern Find Affairs in Serious Condition—Plan for Reorganization Recommended.

One of England's oldest and most famous manufacturing concerns, Humber, Ltd., which at one time enjoyed world wide fame through its bicycles and which several years ago took up the manufacture of motor cars, is in serious financial straits. Its situation is such that a special committee, appointed by the stockholders, has investigated its affairs, with the startling discovery that although its production in 1908 was no greater than in 1906, its expenditures for the year were £131,000 more. In the last two years it has spent £254,000 on its plants.

To save it from ruin and to provide a reconstruction of its finances, the committee recommends a reorganization, the new company to be capitalized at £650,000, of which about half would be in preferred shares with 6 per cent. cumulative interest. In the exchange for old shares, the stockholders would increase their investment, with no diminution of par value in the shares.

A plan similar to this has been adopted in the case of Argyll Motors, Ltd., whose sensational failure was recorded some time ago. The palatial factory at Alexandria, Scotland, with gilded domes and marble halls, has been taken over by "Argylls, Alexandria," a modest reorganization to carry on the business.

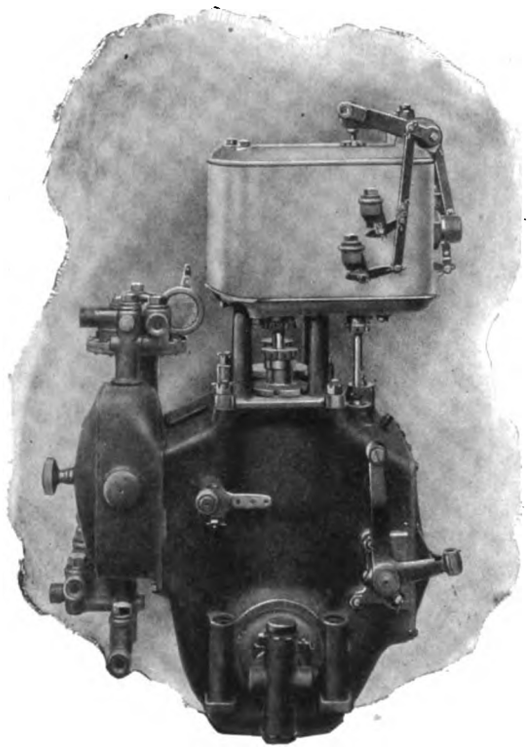
Standard Roller Makes Promotions.

F. M. Germane, sales manager of the Standard Roller Bearing Co., Philadelphia, has been appointed assistant general manager of the company. T. J. Seller succeeds him as sales manager, while F. W. Lawrence has been made the western representative, with headquarters at Chicago.

Brock to Manage Thomas Motor Cab.

Marcus I. Brock has joined the forces of the E. R. Thomas Motor Co., Buffalo, N. Y., and will manage the Thomas Motor Cab Co. He was formerly assistant general manager of the A. L. A. M., later returning to the Autocar Co. to resume a previous connection as sales manager.

Inter-State Appoints New England Agent.



The Inter-State Automobile Co., of Muncie, Ind., has appointed the Sewing Machine Supplies Co., 22 Lincoln street, Boston, Mass., as its New England agent. The territory awarded includes all of the New England states except Connecticut.

Bowles to Manage Stearns Advertising.

George H. Bowles has become a part of the aggressive selling end of the F. B. Stearns Co., of Cleveland, O. He will act in the capacity of advertising manager.

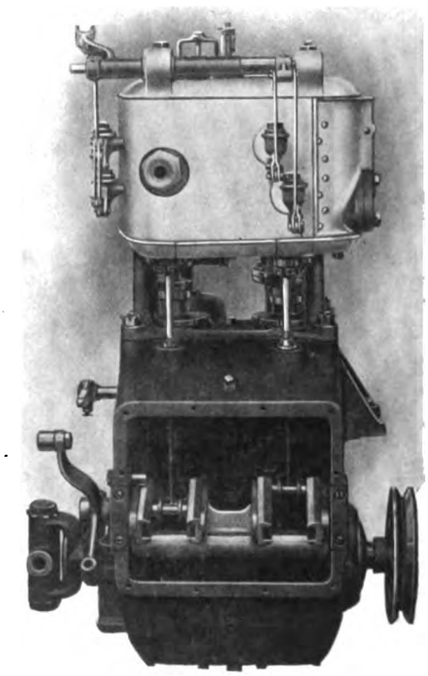
THE SIMPLICITY OF
The White Steam Engine

Rear View of Engine



THE accompanying illustrations show the simplicity of construction of the engines used in the 20 horse-power and in the 40 horse-power White Steamers (the power plants of the two models are identical except as regards size). The White engine is more compact, weighs less and has fewer parts than any other automobile engine of similar power rating.

Each cylinder of the White engine is delivering power all of the time; that is, there is steam pressure back of each piston, pushing it in the direction in which it is going, whether moving up or down. In other words, each of the two cylinders of the White engine is equal to four cylinders of a gasoline engine, as regards continuous application of power.

It will be noted that there is no fly wheel on the White engine and that it is attached positively to the driving shaft without the use of a friction clutch. The engine is reversed simply by changing the tilt of the valve guide, shown in the lower illustration.

The crank-shaft of the White engine is a short one-piece forging with but two main bearings. The valves are driven from the connecting rods, this construction being known as the Joy valve motion. There is but one valve for each of the two cylinders. The valves are of the piston type and, the steam pressure being the same on all sides of them, the power necessary to operate them is negligible.

The White engine is the only automobile engine which develops great power at very low speeds, and even when starting. The driver of a White can operate his car at any rate of speed desired —from a "crawl" to the highest speed of which the car is capable —simply by varying the speeds of the engine. This is done by means of the throttle, the action of which is to vary the amount of steam admitted to the cylinders.

Right side of engine, with side plate removed from crank-case, showing the valve-guide

NEW YORK, FEBRUARY 11, 1909.

Meeting the Modern Burden.

When a heavily laden motor vehicle crashed through a bridge at Allentown, Pa., recently, killing the chauffeur and one of his companions, the accident was not due to speed but to weight. The truck broke completely through the flooring of the bridge, falling into a creek below, where the men were drowned. Unhappily the catastrophe, although among the first of its kind, appears in the light of a leader of a series of similar disasters which may be expected to accompany the more general introduction of motor trucks of the heavy type.

According to the accounts, the truck itself weighed about four tons and the load of flour which it carried came to a little less than three tons, so that together they made a total weight of between six and seven tons. Assuming an even distribution of the weight, the point of contact for each wheel supported about two tons to which, in the case of the driving wheels, the strain of tractive effort was added. The bridge through which the truck dropped was built in 1840, when heavy motor vehicles were unthought of. Its wooden flooring had been renewed from time to time, each renewal approximately answering the specifications of its predecessor, so that in effect the situation was that of an 1840 bridge trying to meet 1909 conditions.

The structure did not collapse as a whole, having been designed to support a fairly heavy traffic for the time, but a section of the flooring ten feet long and extending completely across from one side member to the other, gave way completely, letting the truck drop backward down into the water some twenty feet below, where the vehicle was completely submerged.

Although on the outskirts of the city, it was practically a city bridge and therefore might be presumed to be capable of sustaining city traffic. But the introduction of the heavy types of motor propelled commercial vehicles has precipitated a situation which is almost entirely new to those responsible for bridge strength and safety, and one which they have not yet had brought to their attention in any very direct way.

As the perfection of comparatively small motor vehicles capable of carrying enormous loads continues the requirements thrown upon both city and country bridges will be greatly increased. Pioneer users of heavy capacity trucks can hardly expect the authorities in charge to relish the idea of making the expenditures necessary for strengthening the bridges in their jurisdiction to answer the needs of the new vehicles, and a broad view will show that unless the volume of motor vehicle traffic over any particular bridge be a fair proportion of the whole, any immediate demands of this character must be made in moderation.

To the probable purchaser of a heavy motor vehicle, the question is thus presented as to whether the physical condition of the bridges in his neighborhood will embarrass his use of them, while to the manufacturer is brought the necessity of assisting his actual and prospective customers in getting both road and bridge conditions which will make possible the most satisfactory use of the newer method of merchandise transportation.

Large users of heavy trucks may be of sufficient local influence to get the changes they want, but the biggest work can be done by the commercial vehicle manufacturers in instituting an educational campaign among county commissioners, municipal bridge engineers bridge contractors and others as to the necessity of providing for the conditions of the constantly increasing motor vehicle traffic. The expense of such a campaign, while considerable for any one manufacturer to undertake would, if divided among three or four, be quite light, while the measure of its effectiveness in producing favorable conditions when new bridges are built or old ones repaired, would greatly exceed the cost.

'Tis sweet to see Joseph Pulitzer battling on the one hand for the freedom of the press and on the other for an exclusion of automobiles from the highways of Mount Desert Island, in the State of Maine. But what can be said of Pulitzer when among his fellow petitioners is Dave Hennen Morris, who was at one time president of the Automobile Club of America, and who is still accounted an automobilist of prominence. Kind friends in New York explain that no matter what real feelings Morris may have about it, he is obliged to fall in with the wishes of his Mount Desert neighbors, such as John D. Rockefeller, Jr., Pulitzer and the like.

Unlike Pulitzer, however, Morris has never essayed the role of a national contender for equality before the law, the integrity of constitutional liberties and "classless" legislation. Apparently Pulitzer's convictions and activities along this line become anaesthetized when they conflict with his personal prejudices. Otherwise his position is inexplicable, as he is not a toady.

A staggering blow was dealt the automobile by Senator Bailey in Washington last week, when he declared that "The horse has the right to the highway by what we call in law the ancient and prescriptive right." This heritage, which even the unborn colt enjoys, is apparently denied to the oldest handiwork of the earliest motor car pioneers. Facing this unequal situation as bravely as they may, the friends of the automobile must make the best of it, and with an eye to the benefit of posterity should assert now the modern and prescriptible right of the motor car, so that ultimately, centuries and centuries hence, the self-propelled vehicle may grow gradually into the holy estate of which the horse—and presumably the cow, the ox, the pig, and the chicken—are the arrogant tenants.

Chicago a Blend of the Old and the New

Skillful Treatment of Last Year's Decorative Features Effects Impressive Picture of Bronzed Beauty Softened by Flowers and Potted Plants—Licensed and Unlicensed Cars Staged Side by Side and Flanked by Some New Comers, One of Them Having Revolutionary and Yet Unfreakish Characteristics.

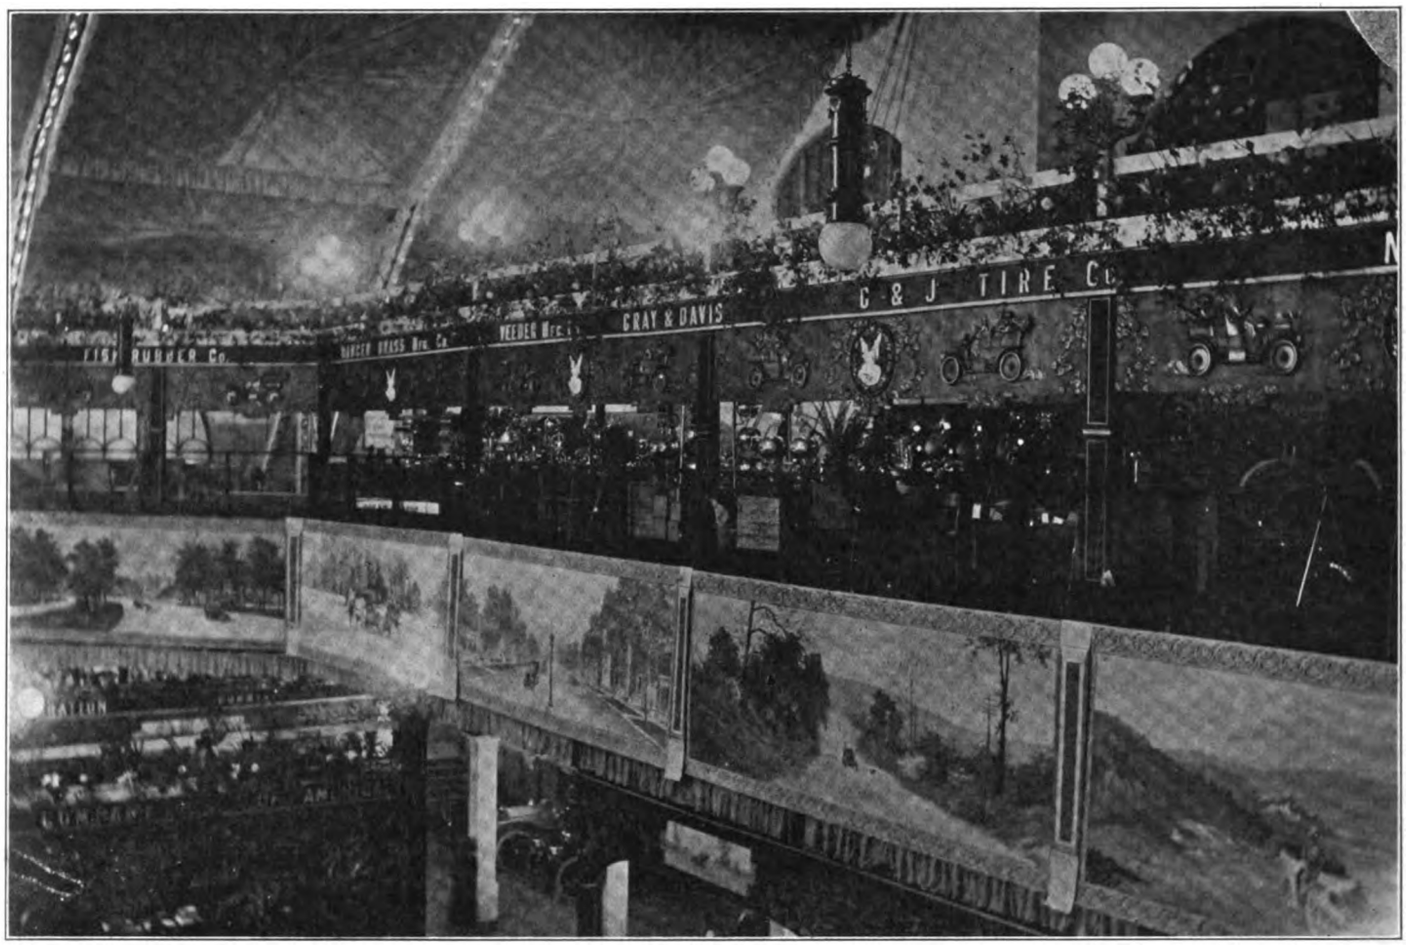
Chicago, Sept. 8,—Advance reports made it appear possible that this eighth national show might go down to history or at least be written of as "the stained glass show." But such thoughts were vain. There is stained glass in the Coliseum, as per advance reports, but not enough of it to make anyone blink very noticeably.

But with or without stained glass the embellishment is impressive; it is full of warmth and color. Nearly everyone agrees that it is a handsome show; there are, as always, those who believe it has "faded to a finish" anything that poor old New York, not to mention Boston or Philadelphia, ever presented to the public. Frederick Eduardo Spooner, the eminent photographer and art connoisseur of Newark, N. J., whose atelier is in New York, but whose tenderer years were spent nearer the course of the opaque and unlimpid waters of the Chicago river, tritely expressed a general opinion.

"Ain't it great!" he exclaimed enthusiastically. "If the New York show cost $40,000, this one must have cost every cent of $50,000."

In Chicago figures talk with more than common eloquence.

Chicago has New York "faded" in one other respect and again is automobiling responsible therefor. "Chi" finally has adopted for its street sweepers the New York costume de rigeur. They, too, now are garbed in sometimes spotless white; but they wear not helmets, but caps with generous visors and as some of them needs must labor after the shades of night have been pulled down, a watchful city has provided means whereby the faithful workmen shall not be maimed or mangled by the swift scud of a silent automobile whose occupants may be busied in that pursuit of pleasure termed a "joy ride." Their guardian therefore has decreed that each humble street sweeper shall be his own lighthouse. When night falls, the faithful fellows press each a button and lo! there gleams from his masthead, or rather capfront, an electric light designed to guide and warn off unwary wayfarers in automobiles. The men who manicure Michigan avenue and Jackson boulevard and who so relentlessly and so rudely disturb the picnicking of the sparrows, carry in their pockets the batteries which keep their beacons aglow. These street sweeping lighthouses constitute what may be more or less expressively described as a great stunt. But as their lights protect only the north sides of the manicurists, what purpose they serve when an automobile approaches their unilluminated south side is not quite clear to a visitor. Of course they have no connection with the show, but as showing the very latest up-to-the-minute influence of the motor car, it is not fair to ignore such an innovation on an occasion such as this one.



It is not detracting from its good looks to say that the queerest and most wonderful part of the dress of this Chicago show is that it very largely is made up of last year's goods. Some of that thrift which is native to New England evidently floated away out here to this gateway of the great west and was caught on the wing, so to speak. For no made-over bonnet or warmed over meal ever showed to better advantage or left a better taste in the mouth. The thrifty individual to whom the work was entrusted certainly made a splendid job of it.

The bunting is new, the potted plants appear to be new, the stained glass is new, and one of the figures formed of staff is new—the nude figure which here and there serves to join the successive archways over the exhibits on the main floor of the Coliseum—the figure of some mythological John Flannagan, or Mike McGrath that is hurling through space not a discus, nor a 56-pound ball, but the wheel of some untamed chariot. Giving impetus to any large wheel of progress is no small task even for mythological man, and judged by his visage and his cramped position, the chap in the Coliseum does not wholly enjoy the allotment of heavy labor apportioned him. When these things are specified as new, the list is about exhausted. All else was brought forward from last year's show—the arches and other staff work, the paintings, the signs, the standards or posts and the carpeting, but so skillfully have they been treated that these ornamentations show no trace of more than a twelve-months' storage in camphor or other preservative, and no one has yet been heard to grumble at the display of Yankee thrift and western ingenuity.

It all is due to the bronzing of the staff work which forms probably the chief feature of the decorative scheme. It was a happy idea and one as effective as it was happy. Last year the huge arches on which in bas relief is a stirring presentment of a chari—of an automobile race flanked by a figure of Fame holding outstretched the palm of victory—last year these were a rusty white or cream color. The mere application of bronze paint has effected a revelation. They now appear as if hammered in burnished bronze and this appearance of metallic beauty it at once so unexpected and so impressive as to compel unstinted admiration.

From the top of each bronzed arch there blossoms a tropical flower garden—ferns, palms, and trailing vines, and pink, red, white and yellow blossoms; and from each flower bed there uprears a succession of three-ball, that is, three-globe electric lights. On each red, gold edged post or standard in front of each booth there also stands a potted plant. The names above each booth are spelled out in raised white letters, also gilt edged, on a red background, exactly as was the case last year. The Modern Mercury—it is difficult to tell its gender—who has removed the wings from his or her ankles and pinned them on his or her head and who holds an automobile steering wheel instead of a serpent-encircled baton—this modern Mercury, which for several years has formed what may be styled the trademark of the Chicago show, again dominates the decorative scheme. Set in or on a cir-

SHOWING THE "ART GALLERY" AND DECORATIVE TREATMENT OF THE BALCONY

cular plaque with red or purple background, "Merc" catches the eye wherever it may roam. It is this figure that has been reproduced in glowing stained glass—glowing because of the electric light concealed behind it. The carpeting of the floor is green, with generous red edging—another contribution from last year. Suspended from the four sides of the balcony are the large paintings of automobile scenes which constituted the "art gallery" on the previous occasion, which "art gallery" has been given a 1909 "touch" in the form of a ruffled edging of yellow bunting.

On the balcony on which are located most of the more prominent manufacturers of tires and other accessories, are the once-white, but now bronzed panelings depicting not an automobile race, or Fame, or the Wheel Tosser, but peaceful family parties or other joy riders pure and simple; and strange to say the chicken wire netting which prevents tires, speedometers and human beings from dropping down on the main floor, once more is in evidence in all its ugly nakedness—a peculiar blur on an otherwise attractive setting.

So very many hues are visible that it is hardly fair to speak of a color scheme; but if such there be it is green and yellow. Green bunting hides the roof of the building. It is in the form of huge squares, each pleated or "gathered" toward a center where it is pinned by a large yellow button. These green squares are divided by yellow "flounces" or ruffles which follow and conceal the lines of the semi-circular steel trusses which support the roof, the lines of the beams being "picked out" in electric bulbs which are half-hid and softened by the yellow rufflings. Yellow bunting covers the windows also and "tones down" the light from out of doors.

In the Coliseum Annex—ground floor—the same general plan of decoration is employed, but upstairs the beauty is again practically unadorned. The only effort at ornamentation comprises green, gold-edged frame work erected over the exhibits, in the top of which has been planted a flower bed. In the subway or basement, with its low ceiling, there is small room for the artistic hand. Yellow bunting on the walls and red signs with white lettering are all that distinguishes it.

In the First Regiment Armory where the "overflow" is located, and which is separated from the Coliseum Annex by a narrow alley, there are more bronzed arches and modern Mercurys, and the roof is concealed by green and yellow bunting, not accordeon pleated, however, but looped and broken in its center by a grouping of flags. But the distinctive feature of the Armory decoration is an "aerial flower garden" or flower show. Wires have been run from one side of the gallery to the other side, and on the wires are suspended small baskets of flowers—the sort of baskets carried by the merry maidens of the footlights. At first glance upward the effect is remarkable. Unconsciously one almost expects to hear canaries burst into song.

The doors of the show opened at 2 o'clock Saturday afternoon and long before the last exhibit was in place the spectators were present in force and their numbers gathered strength with each succeeding hour; in the evening—it was "paper night"—both buildings were packed to suffocation. It was impossible to walk. One simply was borne along by the tide of humanity. Tonight (Monday) the crowd was not so dense, of course, and progress was easier. But at that the buildings were comfortably filled, almost uncomfortably so. Although the real influx of dealers is not expected until later in the week, the vanguard is numerously present, and there are few exhibitors who are not in good spirits and radiating optimism.

"Chicago show weather" did not signalize the opening. In contrast to the usual blustering, bone-chilling atmosphere, Saturday was Spring-like and with no snow under foot, and these conditions held good until tonight when the wind rose and the rain fell, not gently, but in the Chicago "I will" fashion. And about the time the spectators

Digitized by Google

were wending homeward, the rain changed to snow—and such snow! Giant flakes wet and full of glue, which, hurled by a twenty-mile breeze, stuck everywhere they fell. In no respect therefore, does the completeness of this show differ from its predecessors.

In Chicago there is no Mason and Dixon line—that is, no Selden or other patent line; the "pros" and the "antis" are ranged side by side; indeed, even the two well known once pro-Seldenites who so suddenly reversed their attitudes, and who were denied admittance to both New York shows, are here closeby those who view them askant. Maxwells, Premiers, Stoddard-Daytons, Mitchells and Nationals, for instance, are wheel to wheel on the main floor with Great Arrows, Popes, Stevens-Duryeas, Hayneses, Mathesons, Wintons, Corbins and others of the Selden fold, while the Rambler, which is its own association, was in the center of the more or less opposing groups. Steam as represented by "the only" White, and electricity as typified by Baker, Babcock, Woods and Studebaker, were on an equal footing with gasolene. There were no licensed cars in the Armory, but the Jackson was there and the Marmon, the Brush, the Overland and others not unknown to fame, also the Waverley electrics and the only two imported cars in the whole show; the west does not invest very largely in the foreign productions, as the importers who exhibited at previous Chicago shows learned to their cost.

The Cars That New York Did Not See and Their Features

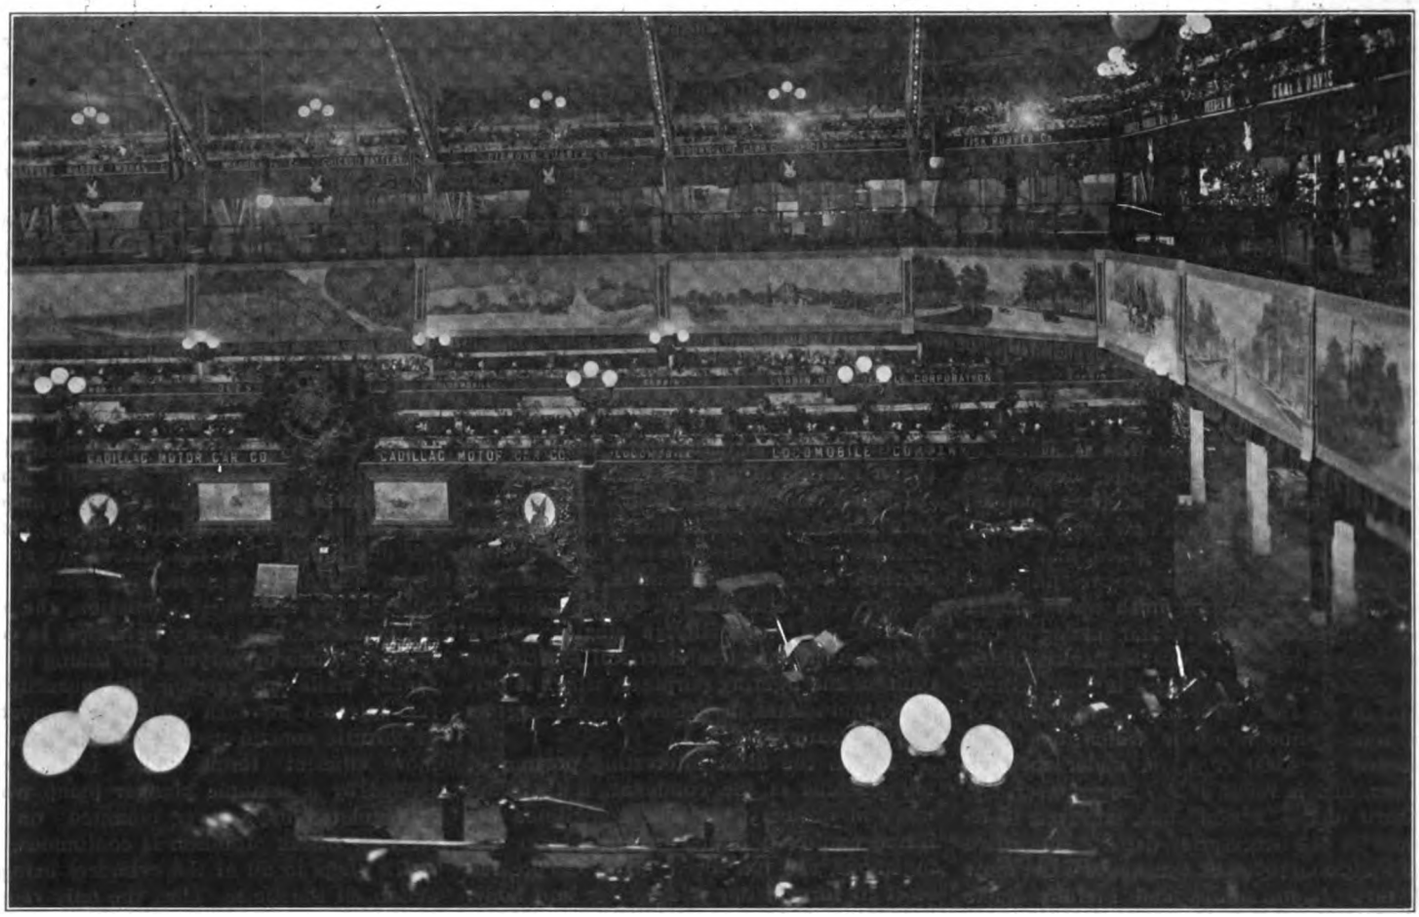
Of course few of those who exhibited in New York display anything new. The Marmon is shown with a glass paneled hood; Apperson stages a new type of roadster body finished in Nile green, and Studebaker a berline body in brown and a suburban body in natural finish with straight back striped with black and having a collopsible rumble seat. Of the new exhibits, the Model company stages a "side attraction" in the form of a tiny reproduction of its four cylinder motor which has been speeded to 4,000 r. p. m. under its own power, and is rated at 2½ horsepower.

Most of the "action" was, however, to be found in the accessories department where the ignition people, as usual, make the most of their opportunities and literally make the sparks fly. The Electric Storage Battery Co. tickles the fancy of the moment with a "C. Q. D." sign, and the Pfanstiehl Electrical Laboratory flash their name in purple in a vacuum tube; but perhaps the most ingenious display and most novel demonstration is made by the makers of the Stromberg carburetter. Mounted on a specially constructed display stand is a standard carburetter in action. The suction is furnished by a small electrically driven air pump concealed behind the stand, while in lieu of gasolene, which is a forbidden luxury at the show, water is used in the float chamber. The only alterations in the construction of the model from a regular stock carburetter, consist in the sectioning of the mixing chamber, and the replacing of the ordinary Venturi, or mixing tube, by a glass tube, of exactly the same size and contour. Back of this tube, a small incandescent lamp is mounted, the light from which shining through the water in the tube, at first gives the impression that it is filled with flame. On closer examination, however, it affords a perfectly clear demonstration of the way in which the suction lifts the gasolene, or in this case, the water, from the jet; and after vaporizing it, draws it into the engine.

Striking Originality of the O. T.

Of the new cars at the show, beyond question the most radical and original and yet unfreakish that has appeared during recent years, and at the same time one that is full of promise in many ways, easily is the Owen Thomas Motor Car Co.'s "O. T. Six." All-metal, single-piece body construction with baked-on enamel finish, and exposed metallic parts, such as levers and handles, finished in polished aluminum; a 6-cylinder motor, with elements air-cooled both externally and internally, a single, rotary valve; and a complete electrical system for ignition and lighting purposes, which is perfectly automatic in action, are among its leading features.

Perhaps the most interesting portion of the machine is the combination replacing what in ordinary parlance constitutes the frame and body units. Here, liberal and ingenious use has been made of pressed steel to form a one-piece frame and body. The sides of the body, frame side members, running boards, fenders and tool boxes are united by riveting and autogenous welding—the body, frame sides and running boards being stamped and bent from a single piece. Although the stock employed is of but one-eighth of an inch thickness, or thereabouts, the design of the fenders, running boards and tool boxes is such as to form a true trussing system, which is reinforced by flanging at appropriate places; while the ends and dash with its arched extension are similarly united to the structure to form a complete unit.



Unit power plant construction is employed, and its mounting is made to do duty in stiffening the frame. The forward support is on a tubular cross member, while in about the center of the vehicle a second cross member, of I-beam section, is made to serve a double purpose in supporting the rear of the power unit and resisting the torsional strains which are transmitted through the torque tube surrounding the propeller shaft. These two members constitute the sole transverse bracing of the structure which is not an integral part of the riveted and welded unit. As shown in the semi-obscurity of the basement under the Coliseum Annex, a plain form of roadster body is revealed with open box and superimposed seats of straight-line contour. A later construction already under way, will follow the more familiar lines of the true touring type, but without deviating from the principle of construction employed in this case.

The motor is unusual in that instead of the ordinary carburetter, through which combustible gas is drawn into the cylinders, the fuel is injected into the mixing chamber direct and while the pistons are at the upper end of the compression stroke. By altering the instant of admission, the timing of the explosion may be varied, as commonly is done by varying the timing of the spark; while by varying the quantity of fuel injected for each cycle, the equivalent of throttle control may be obtained on far more efficient terms. The fuel is controlled by a sextuple plunger pump which is regulated by a lever mounted on the steering wheel. Ignition is continuous, the spark plugs in all of the cylinders being in action all the time. Thus the only regulation required in handling the motor is that of the injector pumps.

The cycle is completed by inducting fresh air through a large port directly in the cylinder head, which is controlled by a rotary sleeve having ball bearings, and communicating with the atmosphere or a large exhaust main, according to the position of the sleeve. By permitting a portion of the cylinder full of pure air which is inducted on the suction stroke, to escape through the late closing of the valve, a simultaneous scavenging and cooling effect is secured, which coupled with the external cooling effected by direct radiation from the cylinders, reduces the cylinder temperatures to an equable amount. The general motive followed is that of the Antoinette motors, and others, but the details are original.

The ignition problem, which with the constant spark, would seem to be a troublesome one, is solved by the adoption of a special form of direct current generator, which is gear-driven from the crank shaft, and which is floated in parallel connection between the spark plugs and an original form of accumulator. In addition to serving for lamp-lighting purposes, this storage of energy is useful in starting the engine, which is done merely by converting the generator into an electric motor while the starting impulse is given the crank shaft. Automatic regulation is worked out in such a way that all that is required in order to start the motor is to close the ignition circuit. This actuates the dynamo.

VIEW SHOWING ONE CORNER OF THE COLISEUM

as a motor until sufficient speed is attained to cause the fuel to be injected into the cylinders when the regular cycle is immediately established.

Dorris's Ingenious Steering Gear.

An original form of the differential screw steering gear is one of the 1909 improvements which have been applied to the Dorris line. In addition to the perfect control of the mechanism which the telescoping screws ensure a further advantage peculiar to this type is adjustability, which may be carried to a degree which is out of the question with gears of either the gear or worm type. Another new feature, and indeed a detail which is conspicuous for its simplicity and directness, is the speedometer device. The speed indicating device is mounted on the center of the dashboard where it is easily read from any part of the car. From this point a short length of flexible shafting runs down through the floor board and back to the rear of the gear box, where it is driven directly from the main transmission shaft by means of a metal to fiber gear couple. The entire length of shafting being either above the flooring or protected by the metal underpan and further, being free from the frequent flexures which occur when the drive is taken from one of the steering knuckles, obviously is well protected from injury and thereby is advantageously placed. At the same time, it should be observed that this is the first instance known in which the rear wheel motion has been used in any way for driving an auxiliary of this sort. Ordinarily it has been supposed that the slip of the driving wheels would be sufficient to vitiate any indications so obtained.

Other changes in the 1909 models include the adoption of a sight feed glass in the oiler, which is mounted on the right of the engine and on a level with the tops of the cylinders; and the use of copper connections on all water piping except at the radiator where the usual short rubber connector is introduced to prevent straining the fittings; and a change in the bracket supporting the cross member of the three-quarter platform spring which is used in the rear. In the touring model this permits the use of a relatively long body without necessitating an excessive length of wheel base, while in the roadster model a variation of the same construction permits the use of a short frame, comparatively speaking, without requiring any change in base from that adopted for the other car.

Even with the improvements indicated and the addition of a vertical flat tube radiator, which displaces the former gilled tube pattern, the touring model follows pretty closely last year's construction. The method of mounting the motor and of suspending the gear box on the rear motor bracket, remaining the same as heretofore. The roadster model is new this year.

Halladay's Three New Models.

Ignition by the new Bosch single coil system is one of the features which is accentuated in connection with demonstrations of the Models "E," "F" and "G" Halladay, all of which are new this year, and which, in reality are variations in body mounting imposed upon a single type of chassis. The types are classified, respectively, as runabout, detachable tonneau and four-passenger tourabout, which is another name for the general style of miniature tonneau in present popularity. This machine is driven by a 24 horsepower 4-cylinder motor of generally standard construction and measuring 3¼ by 4½ inches, cylinder dimensions. Shaft drive, including a neat form of axle-mounted change gear with enclosing torque tube over the shaft; and 32 inch wheels shod with tires of sizes depending upon the body are numbered among the more important specifications.

Model "D", as it is called, is practically a reproduction of a similar machine turned out last year. It is built with a 35-40 horsepower motor, propeller shaft drive, 3-speed selective change speed gear mounted in the waist of the chassis, and has a catalogue weight of 2,650 pounds. The machine is in no wise out of the ordinary so far as its structural features are concerned, though

Digitized by Google

a number of details have been worked out in an original and interesting fashion. This is particularly true of the body mounting, in which, for example, the use of tufted upholstery on the back of the front seat affords a protection to the passengers in case of a sudden forward jolt, while it also does away with any possible marring of the finish such as becomes an objectionable feature of much-used cars, in many instances.

Triplet Cylinders for Berliet.

Although the connection between American and foreign interests which have been allied in producing Berliet cars in the past has now been altered considerably, it is a curious fact that the imported product should bear the imprint on all its radiator fronts of a locomotive of the American type. It is explained in this connection that the mark was adopted by the foreign makers of the car several years ago, at the time when the American Berliet car, which has since been supplanted by the American Locomotive, was being assembled almost wholly from imported parts. As showing that the two machines are no longer to be confused, it is pointed out at the stand of the Berliet Import Co., that the vehicles there shown are made to include a number of improvements which are patented under terms not shared by the makers of the Locomotive car. Thus the smaller six cylinder model is built with cylinder castings in units of three, the frame members are much deeper in section than formerly, and the construction of the shaft drive on the 40 horsepower models, is indicated as being of original and recent design. Two chassis of stock type, stripped for demonstration purposes, and a touring car, comprise the exhibit.

Enlargement of the Alco Line.

Although displayed at one of the several "private" exhibitions which took place during the period of the New York shows, the American Locomotive Motor Car, usually known as the A. L. Co., is here revealed in its various models practically for the first time this year, so far as the presence of a big audience and the comparative advantages of the contrast obtained by its position among other products are concerned. In addition to the six cylinder show chassis and the standard touring types, body mountings disclosed include two types of the popular enclosed vehicle. One is a light landaulet town car, similar mechanically to the taximeter cab which is largely in use. The other is a limousine, impressively finished in light grey carriage cloth.

Two of the models shown are new this year—the 16 and 22 horsepower types. The latter, however, as worked out in commercial service, hardly is to be considered as an innovation. The 22 horsepower model which is absolutely new, is patterned closely after this successful type. It has the same style of rear axle housing which is made in the form of a solid forging, the mechanism being so designed that it may be removed in its entirety without even jacking the wheels off the ground or disturbing the remainder of the car otherwise than to remove the hub caps and the cover plates on the differential housing. Common to both these models are the use of a four-speed selective change gear with master clutch of the multiple disc type, and low tension ignition with make and break spark.

The 6-cylinder 60 horsepower model is continued over from last year practically unchanged save for an increase in the wheel base from 126 to 139 inches. The fourth model displayed is the 40 horsepower 6-cylinder, which structurally is a practical sextuplet. Both have jump spark ignition with Bosch magneto, automatic oiling by splash, with sight feeds to the shaft, on the smaller and self-contained pump system on the larger; four speed, selective gearsets with direct connection on both third and fourth relations through a double bevel drive to the countershaft, and final transmission by side chain.

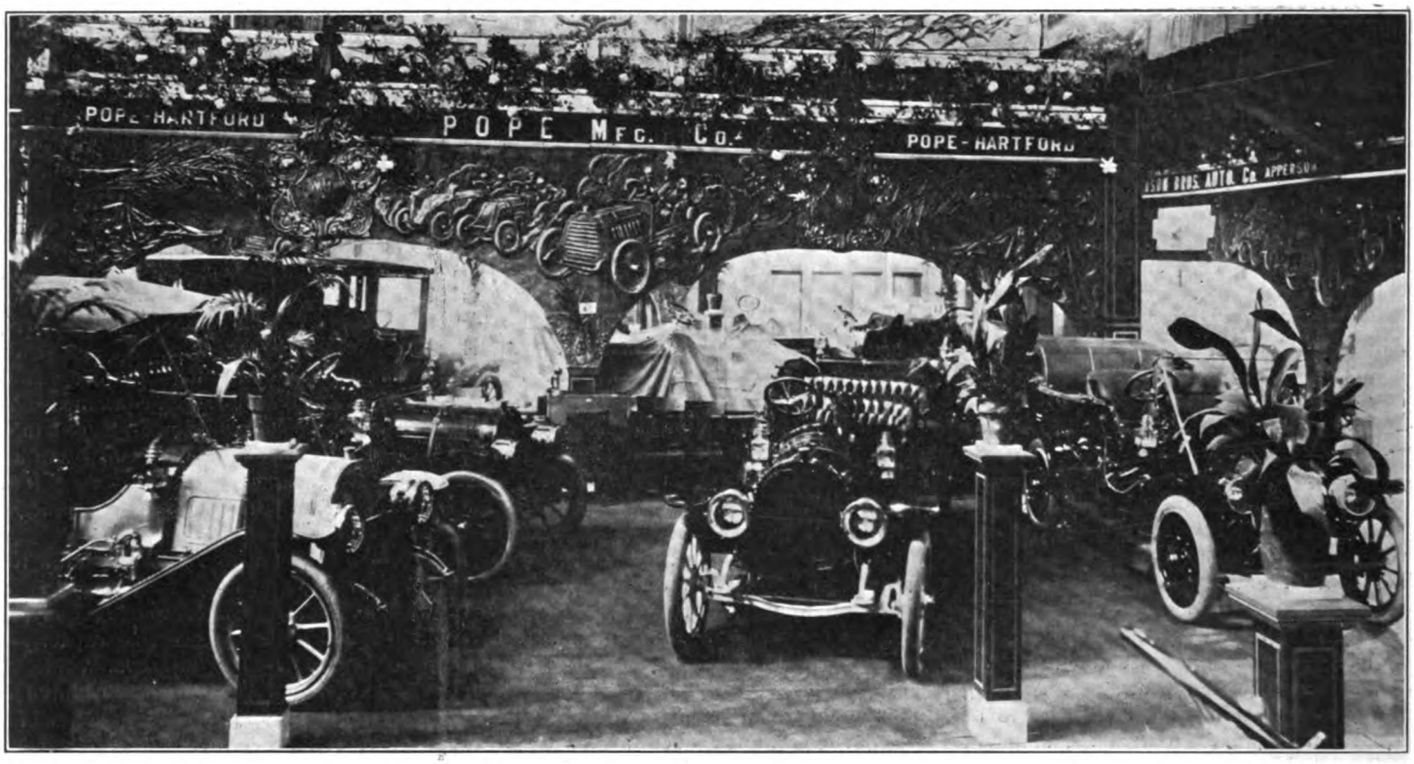
For some time it has been an open secret that the American Locomotive Co. has been laboring over the production of a commercial vehicle of the truck variety. This, it is now announced, is of 3-ton size, and is being, produced on order, though none is actually on view at the show.

New Features of the Glide.

The driver's convenience has been considered in one instance by placing the air pump for raising pressure in the fuel tank on the right side of the foot board, where it is mounted vertically inside the control levers, and ready to hand. Incidentally, this feature supplies a ready means of identifying the model "R" Glide roadster—which is entirely new this year. This model is of four passenger capacity, and has a fuel tank of oval section mounted behind the body and above the level of the chassis. A variation of the same construction also is offered in which seating capacity is provided for but two passengers, while the rear of the vehicle is occupied by a suit-case trunk, useful for the personal impedimenta of the motoring tourist.

Structurally, model "R" follows the general specifications of last year's touring model, having in fact the same engine, and the axle-mounted change speed gear which has been in use by the Bartholomew company for the past two years. The standard chassis for the 1909 models is, in fact, much the same as that used last year, but improved in a number of respects. One of these is the adoption of "clean-out" valves in the sides of the cylinders. These are in a word, plain sealing plugs inserted in the cylinder walls opposite the spark plug openings and of sufficient size so that a hooked scraper may be introduced from either side and any carbon deposit cut from the piston head when it has been brought to the upper dead center, after which it may be blown out through one of the two ports.

Another new feature this year is the steering gear, which is of the bevel gear and arm type—original in design and construction. In it, the use of a high reduction between a very small driving pinion and a large driven bevel mounted on the steering rocker shaft gives a practically irreversible effect while distributing the shock of any side stresses on the front wheels through the entire mechanism, instead of concentrating it in the gear itself. Double ignition, which is an extra option to the purchaser, is provided for in an ingenious linkage whereby both magneto and coil timers are advanced simultaneously. The self-contained system of motor lubrication formerly used in only part of the line, now has been made a universal feature. The pump, being located within the crank case, requires practically no attention from the driver.



Model "G," the touring companion to the roadster type already mentioned, is built with a seven-passenger touring body, as a limousine of the same seating capacity—the two mountings being interchangeable. The Glide is one of the Timken mounted cars, both axles carrying full equipments of that type of roller bearing.

Uniformity of the Great Westerns.

In addition to "the smallest 4-cylinder, vertical motor in the world," the Model Automobile Co. also boasts the construction of "the largest 4-cylinder, 4-cycle, vertical motor in the world," which has cylinders of 16½ by 26 inches bore and stroke, a rated output of 500 horsepower, and runs on producer gas. The peculiar relationship between this motor which is used in electric lighting service, the midget on view at the show, and the various motors employed in the regular stock models of the Great Western car is that they are identical in design and construction and different only in size. The principle of uniformity in design, however, is not confined to the motors alone. The four types of car produced are virtually four different sizes of the same product. Three of them are new this year, that is to say, models 20, 21 and 24, and their horsepower rating are, respectively, 30, 40 and 50. Model 22, also a 50 horsepower machine, but of larger capacity and heavier construction in general than Model 24, is in its third year of service, though it has not been exhibited before.

These characteristics may be noted about the machine: The cylinders have inlet valves mounted directly in the head, and actuated by an overhead beam and tappet rod, and exhausts set in effect pockets which are brought forward slightly instead of being placed across the car, whereby a better arrangement of the cams is secured than would be possible otherwise; and a specially constructed exhaust manifold of increasing diameter frame front to rear, leading to an exhaust pipe of practically four times the area of any single exhaust part—the intention being to avoid all back-pressure in the main by this means. The

transmision, which is by cone clutch, selective change gear and propeller shaft, is provided with double universal connections between gear box and axle.

Auburn Adopts Four Cylinders.

Auburn cars, which heretofore have figured only in double-opposed models, this season have blossomed out in a new departure in the shape of a very neat appearing quadruple type, which possesses a number of meritorious features in addition to the interest which, as always is the case, devolves upon the adoption by a manufacturer of several years' standing of a type entirely different from anything before produced. Aside from being in many ways a more pretentious machine than has before gone under this name, the car itself has several points which are worth noting, though none which are in any way radical departures from what is generously termed standard construction.

It has a four-cylinder, 4 by 4 motor, rated at 25-40 horsepower, a three-speed selective gearset, mounted in the waist of the chassis on a substantial channel steel sub frame, and shaft drive. The transmission is protected from warping of the frame by double universal joints between the fly wheel and the gear box, while the flexibility of the propeller shaft system is sufficient to safeguard that section of the chassis from injury from this source. The rear axle is of the semi-floating type, the torque tube, which is hung on the rear bearing of the gear box, being relieved of all driving strains by the radius rod driving system. Ample protection against wear is afforded all vital parts, this principle in the case of the clutch, resulting in the enclosure of that member, which is of the multiple disc variety, in the same casing with the change gear system.

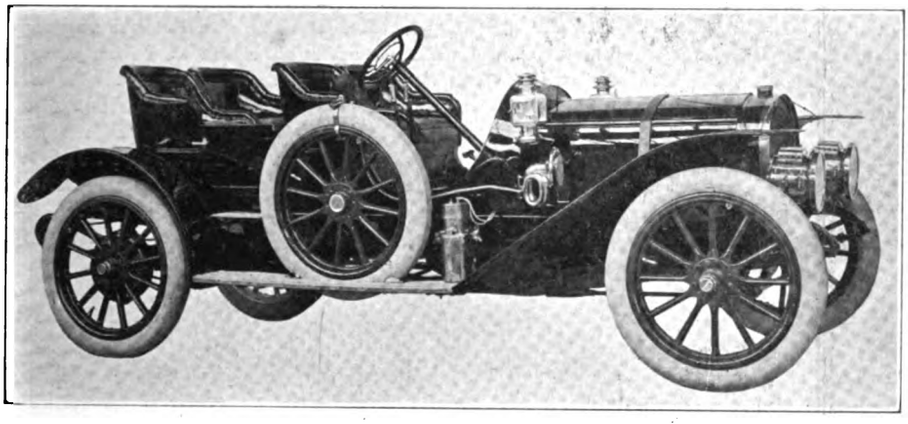
The twin-cylinder opposed model, which formed the mainstay of last year's product, is continued with various alterations, mostly of a minor nature. The engine employed is rather larger than the average of its class, being 5¼ by 5 inches cylinder dimensions. Both chassis types are built to specifications for touring bodies, as well as the double and single rumble types of roadster. The effect of these options thus is to constitute a line of six machines to all intents and purposes.

Meteor's Marked Originality.

Although not appearing at Chicago during the past two years, the Meteor car has been very much in evidence in its own particular territory, and now comes to the front in the form of a rather impressively designed touring car and roadster of the heavier type, in which are involved a number of ideas which are out of the ordinary. Thus, for example, the use of steel castings has been eliminated in favor of manganese bronze castings and steel drop forgings. The unit type of power plant mounting has been adopted, but in the form of a sub frame which has a flexible or rather yielding support on the frame. Another point of interest is in the method of "hooking up" the rear axle, which in a number of respects is different from either of the several methods in common use.

The sub frame, or power plant skeleton just mentioned, instead of receiving its support from the main frame at the sides, front and back in the usual fashion, is carried at the sides, at a point midway its length, where the sections carrying the motor and gearset, respectively, and which are channel steel, are joined by massive bronze castings, which also afford the supporting properties necessary. A detail to be noted in passing, is that these members also furnish means for supporting the auxiliaries, such as the oiler, the unusually large centrifugal water pump, and the magneto. Beneath these accessories, and between the fly wheel and the gear box, a tubular cross member from side to side of the main frame, serves to tie that structure and also to afford the power plant its central support. The front and rear ends of the plant are hung by means of rocker bearings in the centre of the frame, one beneath the radiator, and the other on the lower side of a cross member which spans the frame just back of the gear box.

The engine, which carries individually cast cylinders of the T-head type, is noteworthy in respect to the method of connecting the water leads, which instead of being taken in and out at the top and bottom respectively as in the ordinary method of construction, are led to and from the tops of the cylinders at diametrically opposite points. The main circulation is thus effected about the combustion chambers, while the currents to the lower and cooler regions of the jackets are secured by means of deflector plates which are carried on the lower side of the jacket covers which close in the tops of the cylinder units, which direct the flow in the desired direction.



Radius rod drive, which is accommodated by inserting a slip joint in the torque tube,

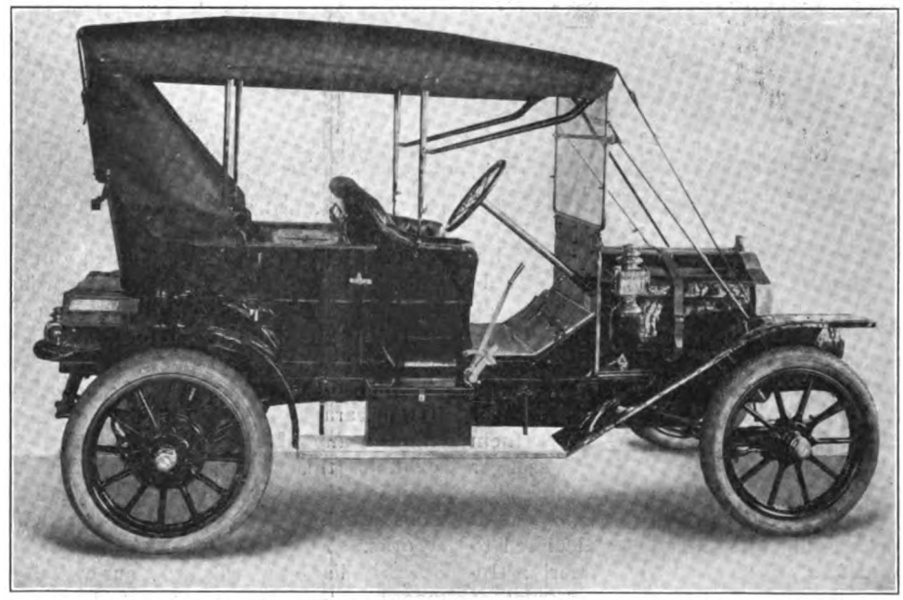
Digitized by Google

is provided, the system being worked out with an eye to great strength, with a maximum of flexibility, and all obtained along lines which are by no means hackneyed, if not absolutely original. Indeed, the combination obtained in the rear mounting, appears to be distinctly out of the ordinary. That this is necessary because of the load which may be imposed upon the mechanism, is shown by the fact that the motor, which is modestly rated at 50 horsepower, has cylinders which are 5 by 5½ inches.

Spare Wheels on the Ramblers.

Although it has been described and commented upon already since it appeared for the first time, many weeks ago, the Rambler product in its various phases, has not previously appeared at either of the great shows, its unveiling in New York having been at a "private" exhibition held at the headquarters of the distributors for the local territory. In addition to this fact, however, it merits special mention as a number of new features have been added from time to time since the first announcements of the 1909 line. The spare wheel, which is an adaptation of the ordinary artillery wheel construction such that a spare, which always is carried on the machine, may be adapted to either corner of the car in the event of either a deflated tire or an accident, is one of them. This device is of broader utility than the ordinary spare wheel, so-called, in that it is suitable to replace not only a damaged tire, but also a damaged wheel in its entirety. Another of the new devices is a windshield which has only recently been brought out, and which possesses the feature of ready adjustability to any angle, since it is of the divided type.

RAMBLER, MODEL "45"

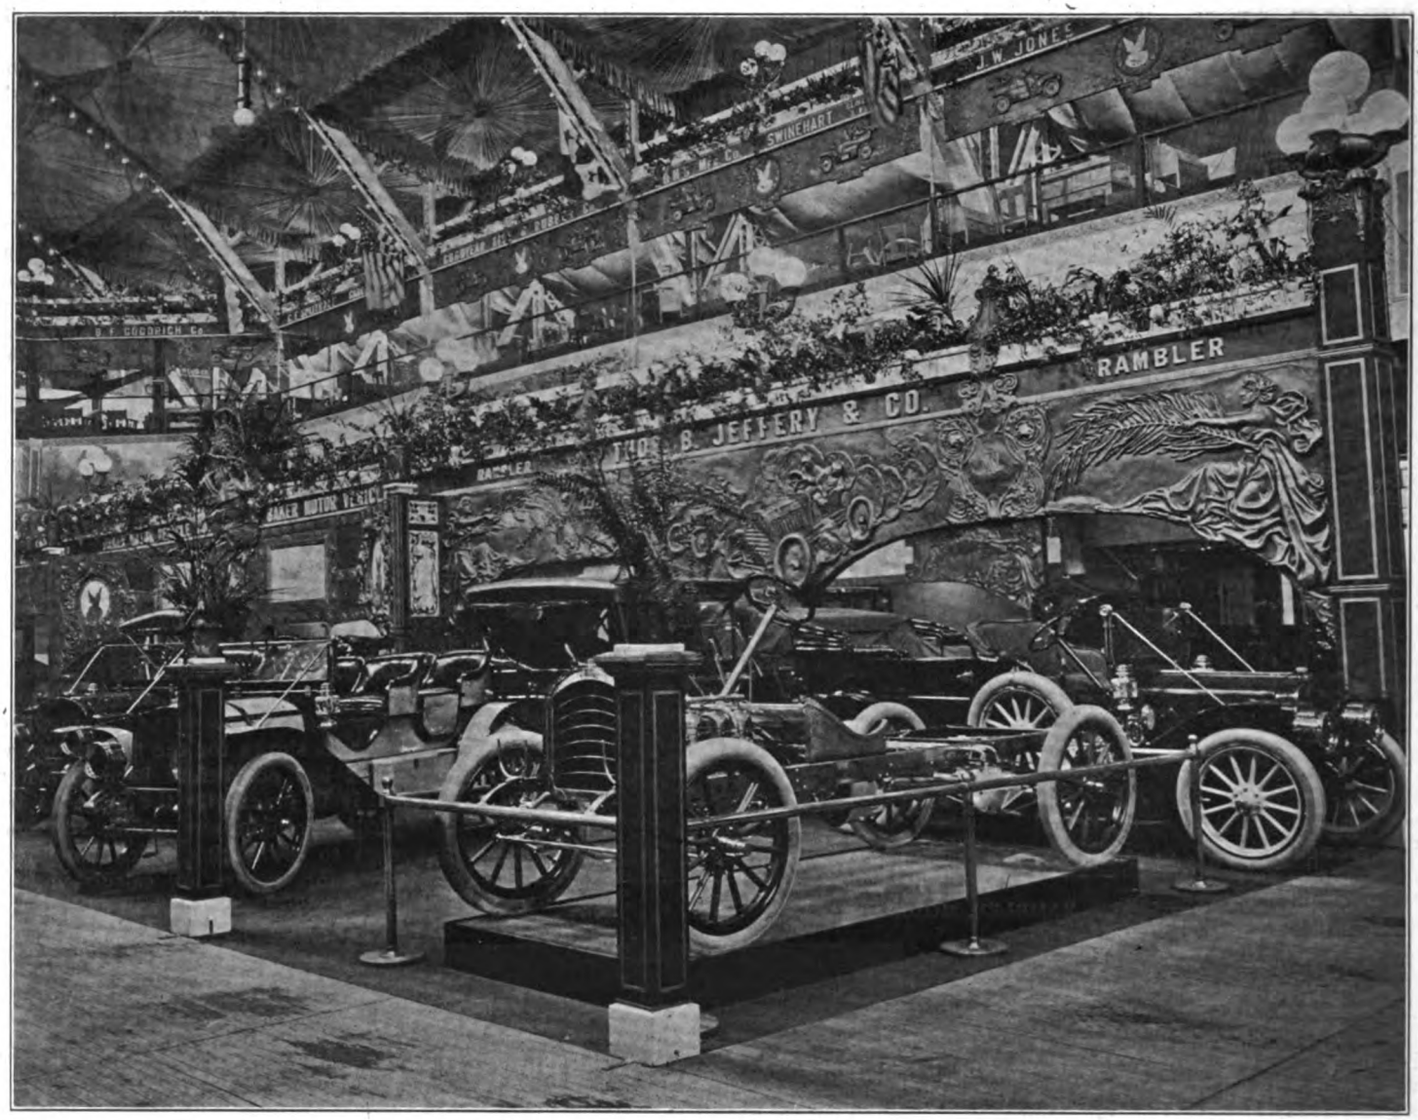


Of the cars themselves, Model "45" is new—even to the 1909 line. It is much the same as the previous model "44", but has 125 inch wheel base instead of 112, as on the other model, carries seven passengers, and in general is a larger and more commodious machine. In common with Model "44", then, these features may be noted as novelties in the latest of Rambler constructions: Triple action springs, which are calculated not only to absorb minor vibrations, but also to act as veritable shock absorbers in checking the rebound after impact; ¼-inch deeper frame members than were used last year, improved lever connections between the change speed gear and the gearset, a direct acting clutch, instead of the reversed conetype formerly employed; and a simple and ingenious method of spark plug connection which takes the form of a switch, and which does away with the loose-ended effect so often found where the high tension wires are led directly to the plugs and where frequent renewals and replacements ultimately tend to destroy the effectiveness as well as to mar the appearance of the ignition system.

As heretofore, the four-cylinder vertical motor is employed, as is the method of mounting the gearset directly on the torque tube. This forms a practical equivalent of the axle mounted gearset, without the chief objectional feature of that arrangement, which is the effect of shock on the rear axle as transmitted to the gears and shafts. Though the effects produced in this way actually are less serious than they would seem to be likely to be, it is thought that by throwing the change gear group well up to the forward end of the torque tube and thus placing most of its weight on the bearing which supports that member, a lighter axle, less severe on tires, results which also produces a durable and generally more satisfactory transmission system.

In connection with demonstrations of the theories involved in the various structural details of the cars, explanations of the principle of offsetting the cylinders and so of reducing the wall thrusts upon the cylinders and pistons are elucidated by means of a very simple working model, small enough and light enough to be held in the hand; yet practical enough to show by the various adjustments which are possible, just how the advantage is obtained by this practice, and where the advantage lies.

Firestone-Columbus a Newcomer.



One of the newcomers at the show—totally unheralded to the public, though for some time expected in trade circles,—is the new Firestone-Columbus, produced by the Columbus Buggy Co., and forming its second incursion from the electric into the gasolene field. The first, a high-wheeled buggy, was shown for the first time a year ago, but has not before been shown this year. It is practically the same as when originally brought out saving for sundry changes to the engine which though of a minor nature nature are calculated to improve its power and reliability.

FIRESTONE-COLUMBUS 30 H.P. TOURING CAR

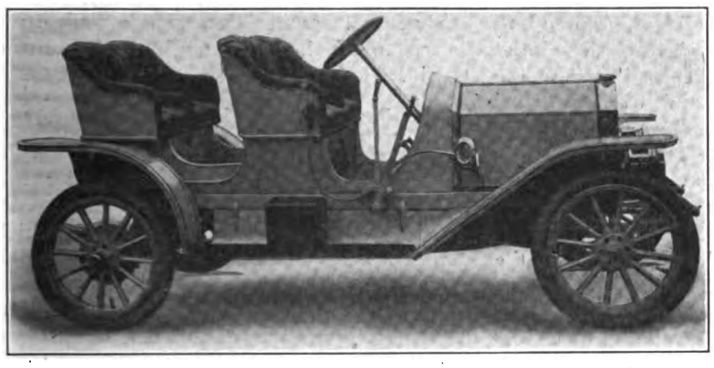
The new gasolene vehicle is of the regular four-cylinder type, and is a neat little offering of the medium-priced-completely equipped type. As shown, it mounts a five-passenger touring body of neat delineation and original in the manner in which the rear is extended to form a support for the trunk rack, which thus is robbed of its occasional obtrusiveness as found in other designs. It also is built in baby tonneau form.

Digitized by Google

RAMBLER EXHIBIT, INCIDENTALLY SHOWING THE DECORATIVE "SUNBURSTS" CONCEALING THE ROOF

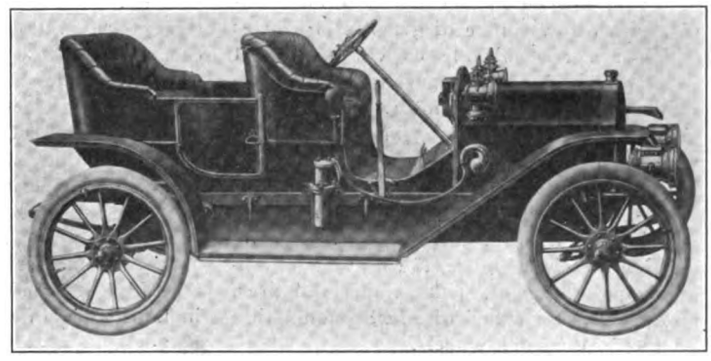
It is driven by a 32 horsepower, four-cylinder motor, of 4½-inch "square" cylinder dimensions, has a 3-speed selective gearset, shaft drive, 110-inch wheel base, and 34 by 4-inch tires.

Longer wheel base and larger motor equipments in the electric vehicles shown, are the principle differences between them and last year's models. A four-passenger coupe type is new this year and embodies among other features a novel arrangement of the steering lever which is calculated to make it less obtrusive than formerly. Instead of being brought up at the front of the seat, the steering post now rises at the seat end, while the lever is offset to the front sufficiently to bring it into an easy steering position.



Stage Larger Types Than Before.

Both in the case of the Oldsmobile and Buick cars, which have not been shown except in salesrooms before this year, so far as the greater exhibitions are concerned, are shown the products of concerns which from a beginning with cars of small and light construction, have reached out after the market for more pretentious products. This movement has been observed in many cases in the industry before, and is constantly reappearing in one guise or another. Another of the machines which has made its appearance at the Coliseum for the first time at any of the 1909 shows, and which exhibits this trend, is the Emancipator, which is the product of a reorganization, or substantially that, of the Aurora Motor Works. The Emancipator in its latest form is distinguished by a four-cylinder opposed motor—rare form in itself—which is noteworthy in that the opposing pistons instead of being linked to the crank shaft by a pair of connecting rods, are joined together by webs which are cast integrally with them so that they act as units, and therefore require but a single connecting rod for each pair of cylinders. The mounting of this vehicle is a neat form of straight-line touring body, of approved pattern, and rather diminutive size. In general, the vehicle, apart from the motor, represents a reconstruction of the old Aurora machine almost exactly. A change in the form of radiator employed, and several other alterations, serve to form a distinguishment which, to the eye of the casual visitor, hardly is sufficient to warrant its being known by the new name.



Unit Power Plant in the Ricketts.

Six-cylinder motors are by no means lacking at the show, and it is noteworthy that, contrary to what frequently has been the case in previous years, several of them are to be found on the new cars. One of these, which has not before been shown, and which, indeed, is a brand new machine, is the Ricketts—a South Bend product. In this car the three-point suspension and unit power plant ideas have been adopted with good effect. The motor has its fly wheel mounted in front, valves in the heads worked by tappets and rocker beams, and the rear of the crank case is jointed directly to the gear housing, the latter also carrying the brake and clutch pedals, so that the plant is absolutely independent of the frame. An original system of interlock-

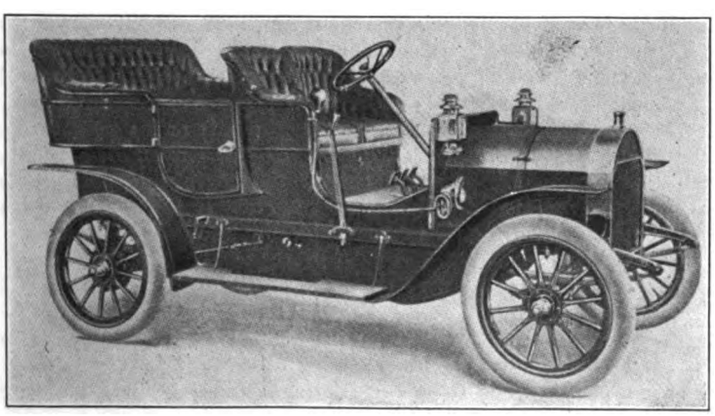
Digitized by Google

GREAT WESTERN MODEL "20 A"

HALLADAY ROADSTER, SURREY TYPE

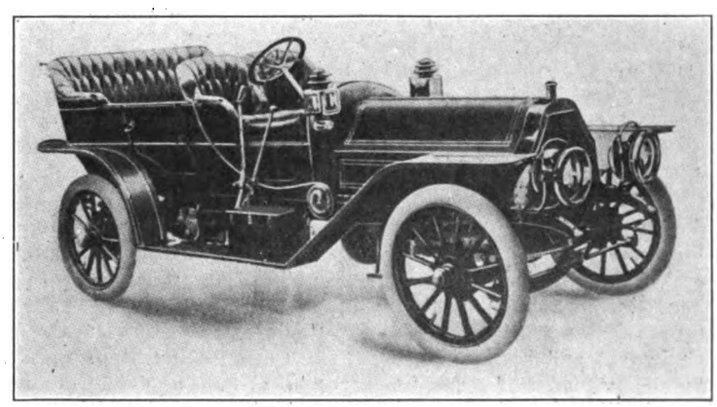
ing the clutch and brakes, as well as of actuating the gears, reveals some little study of a perplexing problem. The rear axle is of the semi-floating type with a combination of ball and roller bearings. The propeller shaft is enclosed in a combined torque and driving tube, which is rigidly braced from the axle ends to prevent any possibility of disalignment.

Mixing Manifold on Pittsburg Six.



In the Pittsburg Six is found a new car of standard proportions which so far as its details are concerned, is lacking in extraordinary features—which is to say, it is of regular construction practically throughout. It is built in runabout, four-passenger roadster, and touring forms, on the same chassis, and has a motor rating of 70 horsepower. An unusual feature of the motor construction, one of the few in the machine, is the intake manifold, which offers a novel solution of the problem of distributing the gases uniformly to the various cylinders. Instead of assuming any of the branched formations which are in more or less common use, the manifold is made in the form of a closed oval and very much flattened, the uptake from the carburetter being on one side, while the leads to the various cylinders are on the other. As a result of this, the flow of gas is divided into two currents which meet at the centre on the cylinder side of the loop, and which are constantly surging back and forth in the tube, thus becoming thoroughly commingled. An absence of carburetter troubles of all sorts, as well as uniformity of action under all sorts of running conditions, are claimed by the makers to be attributable to this peculiarity.

Advanced Design of Rider-Lewis.



Another example of six-cylinder construction in novel guise, is found in the Rider-Lewis, in which an original, and it is claimed, exclusive method of cylinder design has been adopted. In this, adequate cooling properties are obtained for the cylinders by casting them individually and with spherical upper sections, whereby a great volume of water may be concentrated about the combustion chambers. The valves are mounted in the heads, inclined toward each other, and facing oppositely across the car. The valve gear is of the overhead type, a single shaft running the length of the motor over the tops of the cylinders, and driven by a vertical time shaft which is placed in front. The cams and rocker arm contacts are enclosed by neat individual aluminum housings, which afford ample protection from dust and dirt and at the same time increase the apparent simplicity of the design. A wholly up-to-date feature, never seen to any extent on machines until this year, also is found on this chassis, in the suspension of the motor by means of channel steel cross members, which are bolted to the upper side of the crank case. Another feature of the car which is in line with most recent practice, is the use of the unit type of rear axle transmission—the change speed gear being mounted in common with the differential housing. The rear axle itself is of the semi-floating type, while the front one is of I-beam section. The dropped type of frame is employed, with three-quarter elliptic springs. Both roadster and touring models are produced, but only the touring form is displayed at the show, in connection with the show chassis.

Motor Buggies.

The basement under the Coliseum Annex, though cold and cheerless in respect to climatic conditions, rings with advantages of the motor buggy, as proclaimed by its numerous adherents. Here may be found, among others, the Schacht, which was displayed in New York, and the Bendix, which is unlike the former in that while that follows pretty closely the lines of carriage construction, except as the demands of the more severe power plant may have required stiffening, the latter is practically an adaptation of the elements of the full-fledged touring automobile to the high-wheeled realm, with an accompanying characteristic appearance which is about its only distinguishment as a motor buggy. The term "Hi-Lo" applied to this vehicle does not necessarily indicate that it is transformable at will from the status of the large wheel to that of the small, but rather that

AUBURN MODEL "G"

RIDER-LEWIS TYPE "VIII" TOURING CAR

Digitized by Google

it is a high-wheeled machine pure and simple, with a low centre of gravity. Features which are recognizable as coming direct from the field of the touring car are the twin cylinder vertical motor, multiple disc clutch, selective sliding gear transmission with final drive by means of double side is included in the regular equipment of the chains, and the Splitdorf magneto, which vehicle, and without extra charge. Despite its high-wheeled feature, the regular mounting being 42 inches, with 2-inch solid tires, an option is furnished of 3-inch pneumatics, mounted on 36-inch wheels.

Staver's Rear Axle Gear Change.

The use of such parts as have come to be associated with the larger machines only, is not confined to a single machine on view at the show. In the Staver, another example of its use is found. This machine is in its third season of show existence. The model on view, however, is entirely new—never has been shown before—and is a radical departure from anything before attempted by its makers, who are long experienced in the field of carriage construction. The use of shaft drive here is introduced, together with a four-cylinder vertical motor, water-cooled, of 3¾ by 4½-inch cylinder dimensions, and rated at 22 horsepower. A two-speed sliding gear transmission, mounted on the differential housing, is another very modern feature, which is transferred to the high-wheeled field for the first time in this instance, as is believed. A pressed steel frame, tubular front axle, and internal expanding brakes adapted to throw out the clutch when applied, are other features. Two sizes of chassis are built to accommodate rumble runabout and surrey types of body, the latter being of 100-inch wheel base and the former practically the same thing, but shortened to 92 inches in the base. The standard tire equipment is 38 by 2-inch solids, but 32 by 3-inch pneumatics are offered as an option to the purchaser who prefers wheels that will provide a more conventional effect in the running gear.

Motor Variations in the Mier.

Still another development of the full-grown automobile idea is revealed in the case of the Mier, which is built in two types, differing principally in the motor construction. In one case, this is of the twin, vertical type, while in the other the twin opposed type is used. The former is of 4 by 4-inch dimensions, and the latter is 5 by 4. In both instances, the double-disc type of friction change gear is employed, with double side chains to the rear wheels. Four types are built, varying in price and in general characteristics hinging about the differences brought about by the use of the two types of motor, and by various methods of equipment and body mounting. The types known as "C" and "D", for example, are practically the same except that one is designed for two and the other for four passengers. Though belonging to the motor buggy class, these vehicles hardly come into the category of the high-wheeled contingent, since the wheels are smaller than the average. In fact, 32 and 34-inch wheel diameters are called for in the front and rear mountings, and the tires are 1½-inch, of the solid, side wire type.

Duer's Selective Bevel Transmission.

In the Duer is found an example of the true high-wheeled type, in which the original principle of the cable drive still is adhered to as is the unique method of changing gear, in which a system of bevel pinions is employed which may be swung bodily forward or backward to apply the tension to the cables or release it as the case may be. A further refinement in this system is the application of the selective principle whereby throwing the change speed lever into one or another of the several slots in its sector, serves to mesh one or another of the bevel groups; thus altering the speed reduction between the engine and the driving sheaves of the final transmission. The double opposed type of motor is employed, as heretofore, but more power is obtained through the use of 4½ by 4 instead of 4 by 4-inch cylinders. Other changes introduced into the latest models include an increase in axle sizes from 1¼ to 1⅜ inches, and a small increase in wheel diameter.

Another innovation in this connection is the production by the Chicago Coach & Carriage Co., makers of the Duer, of a high-wheeled delivery wagon, which has the same power plant, but wheels, springs and tires larger than those employed on the roadster or buggy type. Mechanical intake valves, instead of the automatic valves formerly employed; a fan made integral with the fly wheel, and a number of conveniences embodied in the design, whereby repair work may be facilitated; are numbered in the advantages claimed for the particular construction here adopted.

High Power for the Fuller.

One of the high-wheeled class, which appears at the show unheralded as far as the preliminary list of exhibitors is concerned, is the Fuller, in which use is made of the double-opposed, water-cooled type of engine, such as is familiar in the better class of runabouts of the standard class of construction. Three point suspension of the power plant, planetary transmission with shaft drive to the live rear axle and 36 by 2-inch tires, of the semi-solid type, are among its more conspicuous features. As revealed at the show, it mounts a body which is a fairly close approach to the so-called Democrat wagon of long usage in the horse-drawn field, and which is capable of seating four passengers, but may be altered by the removal of the rear seat, to accommodate a moderate amount of luggage. It may be mentioned in passing, that the rated motor output of this machine, which is 15-18, is higher than the average. Happily, however, the general construction of the vehicle appears to be heavy enough to stand the strain.

Friction Drive is Zimmerman Feature.

Still another of the much-heralded motor buggy type, is the Zimmerman, which follows the principles of opposed motor construction and friction transmission which find so many staunch adherents in builders of machines of this general class. The motor, which is air-cooled, is placed in front transversely of the machine, and enclosed by a hood of standard automobile pattern. From the motor, a driving shaft transmits the power to a driving disc, which is slidably mounted on the shaft, and which is adapted to contact with a pair of discs on a mounted transverse counter shaft, from which the rear wheels are propelled by the familiar side chains. The motor is given a rated output of 14 horsepower, and the total vehicle weight is set down at 1,250 pounds. The tire sizes requisitioned by the standard specifications are 37 by 1½ inches.

Clark-Hatfield's Solid Live Axle.

Under the name Clark-Hatfield, a reconstruction of the old Hatfield high wheeled motor buggy appears, in which many of the features of the older car are reproduced. An alteration in the position of the motor, which now is placed in the rear of the body instead of under the centre, as formerly, and an increase in its size and power, are among the more important changes. Single chain drive to the live rear axle is employed, and in this connection, use is made of a very ingenius system of clutching the wheels to the driving axle, which is solid, instead of employing the more common differential. As in the common or field variety of sewing machine, to take a homely illustration, the wheels while driven forward, are free to rotate in the reverse direction if required. This provides for the necessary differentiation when making turns. In order to reverse, however, it is necessary to throw over a special driving drum which is mounted on the axle in such a way as to free the normal engagement of the forward driving ratchets and engage in their stead a set of revers ratchets with their corresponding pawls, which permit the same driving and differential action to be secured in the reverse direction of travel. This movement, however, is secured without difficulty on the part of the operator, as the movement of the driven disc of the friction gear, into the reverse position, is sufficient to bring about the desired transfer in the relation of the driving clutches.

Randolph's Thermo-Syphon Cooling.

Commercial vehicles, though lacking the sturdy representation which last year's individual section called forth, yet are present at the show in very respectable numbers. This fact does not appeal to the average visitor, however, unless he happens to take

Digitized by Google

particular note of the fact, for such commercial cars of one type or another as are in evidence, are so widely scattered throughout the immense area of the two sections that they make no impression whatever as an independent class. Nevertheless, a number of useful and interesting constructions are on view—such as the Grabowsky, Rapid, Thomas cab, and the numerous other enclosed town cars, many of which were exhibited at one or the other of the two recent New York shows. The Brush runabout version of the light delivery idea, and an adaptation of the same principle to the high wheeled field, which is shown on the stand of the Anderson Carriage Manufacturing Co., are revelations in their way, though the former, in common with another of the high wheeled commercial machines which is shown in Chicago at this time, was on view at the Grand Central Palace in New York.

An entire newcomer at the show, however, though already more or less known locally in Chicago, is the Randolph. This machine is shown only in the form of a fairly heavy delivery wagon, mounted in three different styles of body. It is explained at the booth, however, that this is but one of an extended line of vehicles, which range in load capacity from 1 to 7 tons, the line including machines of 1, 2, 3, 4, 5 and 7 tons capacity, respectively. Double opposed, water-cooled motor construction with convenient front mounting for the power plant, are among the more salient features of the examples on view. Friction drive is another feature which is likely to be noted. Enquiry, however, reveals the fact that it is applied only to this particular type of vehicle. The larger machines have 4-cylinder, upright engines, and the common form of selective sliding change gearing. As a matter of fact, even on the smaller cars, the purchaser is afforded an option between the friction and selective sliding types of gearing. Another point is the drop frame, the lower section being employed to support the motor.

Summary of Exhibits at the Chicago Show

AUTOMOBILES.

American Locomotive Co., New York—American Locomotive gasolene cars.

Apperson Bros. Automobile Co., Kokomo, Ind.—Apperson gasolene cars.

—Anderson Carriage Co., Detroit, Mich.—Detroit electric cars.

Anderson Carriage Mfg. Co., Anderson, Ind.—Anderson motor buggies.

Atlas Motor Car Co., Springfield, Mass.—Atlas 2-cycle gasolene cars.

Auburn Automobile Co., Auburn, Ind.—Auburn gasolene cars.

Austin Automobile Co., Grand Rapids, Mich.—Austin gasolene cars.

Babcock Electric Carriage Co., Buffalo, N. Y.—Babcock electrics.

Baker Motor Vehicle Co., Cleveland, O.—Baker electrics.

Bartholomew Co., The, Peoria, Ill.—Glide gasolene cars.

Bendix Co., The, Chicago, Ill.—Bendix motor buggies.

Berliet Import Co., Chicago, Ill.—Berliet gasolene cars.

Black Mfg. Co., Chicago, Ill.—Black motor buggies.

Brush Runabout Co., Detroit, Mich.—Brush gasolene cars.

Buckeye Mfg. Co., Anderson, Ind.—Lambert gasolene cars.

Buick Motor Co., Flint, Mich.—Buick gasolene cars.

Cadillac Motor Car Co., Detroit, Mich.—Cadillac gasolene cars.

Cameron Car Co., Beverly, Mass.—Cameron gasolene cars.

Cartercar Co., Pontiac, Mich.—Cartercar gasolene cars.

Chalmers-Detroit Motor Co., Detroit, Mich.—Chalmers-Detroit gasolene cars.

Chicago Coach & Carriage Co., Chicago, Ill.—Duer motor buggies.

Clark-Hatfield Auto Co., Oshkosh, Wis.—Clark-Hatfield motor buggies.

Columbus Buggy Co., Columbus, O.—Columbus electric cars.

Corbin Motor Vehicle Corporation, New Britain Conn.—Corbin gasolene cars.

Dayton Motor Car Co., Dayton, O.—Stoddard-Dayton gasolene cars.

De Luxe Motor Car Co., Detroit, Mich.—De Luxe gasolene cars.

Dorris Motor Car Co., St. Louis, Mo.—Dorris gasolene cars.

Elmore Mfg. Co., Clyde, O.—Elmore 2 cycle gasolene cars.

Emancipator Automobile Co., Aurora, Ill.—Emancipator gasolene cars.

Everitt-Metzger-Flanders Co., Detroit, Mich.—E-M-F. gasolene cars.

Fiat Automobile Co., New York City—Fiat gasolene cars.

Fort Pitt Motor Mfg. Co., New Kensington, Pa.—Pittsburg "Six" gasolene cars.

CENSUS OF THE SHOW.

Gasolene:

Fuller Buggy Co., Jackson, Mich.—Fuller motor buggies.

Gaeth Automobile Co., Cleveland, O.—Gaeth gasolene cars.

Grabowsky Power Wagon Co., Detroit, Mich.—Grabowsky commercial trucks.

Franklin Mfg. Co., H. H., Syracuse, N. Y.—Franklin gasolene cars.

Haynes Automobile Co., Kokomo, Ind.—Haynes gasolene cars.

Holsman Automobile Co., Chicago, Ill.—Holsman motor buggies.

Interstate Automobile Co., Muncie, Ind.—Interstate gasolene cars.

Jackson Automobile Co., Jackson, Mich.—Jackson gasolene cars.

Jeffery & Co., Thomas B., Kenosha, Wis.—Rambler gasolene cars.

Kimball & Co., C. P., Chicago, Ill.—Bodies (mounted).

Kissel Motor Car Co., Hartford, Wis.—Kisselkar gasolene cars.

Knox Automobile Co., Springfield, Mass.—Knox gasolene cars.

Locomobile Co. of America, Bridgeport, Conn.—Locomobile gasolene cars.

Lozier Motor Co., New York City—Lozier gasolene cars.

McIntyre Co., W. H., Auburn, Ind.—McIntyre gasolene cars.

Matheson Motor Car Co., Wilkes-Barre, Pa.—Matheson gasolene cars.

Maxwell-Briscoe Motor Co., Tarrytown, N. Y.—Maxwell gasolene cars.

Midland Motor Co., Moline, Ill.—Midland gasolene cars.

Mier Carriage & Buggy Co., Ligonier, Ind.—Mier motor buggies.

Mitchell Motor Car Co., Racine, Wis.—Mitchell gasolene cars.

Meteor Motor Car Co., Bettendorf, Ia.—Meteor gasolene cars.

Model Automobile Co., Peru, Ind.—Great Western gasolene cars.

Moline Automobile Co., East Moline, Ill.—Moline gasolene cars.

Moon Motor Car Co., St. Louis, Mo.—Moon gasolene cars.

Mora Motor Car Co., Newark, N. Y.—Mora gasolene cars.

National Motor Vehicle Co., Indianapolis, Ind.—National gasolene cars.

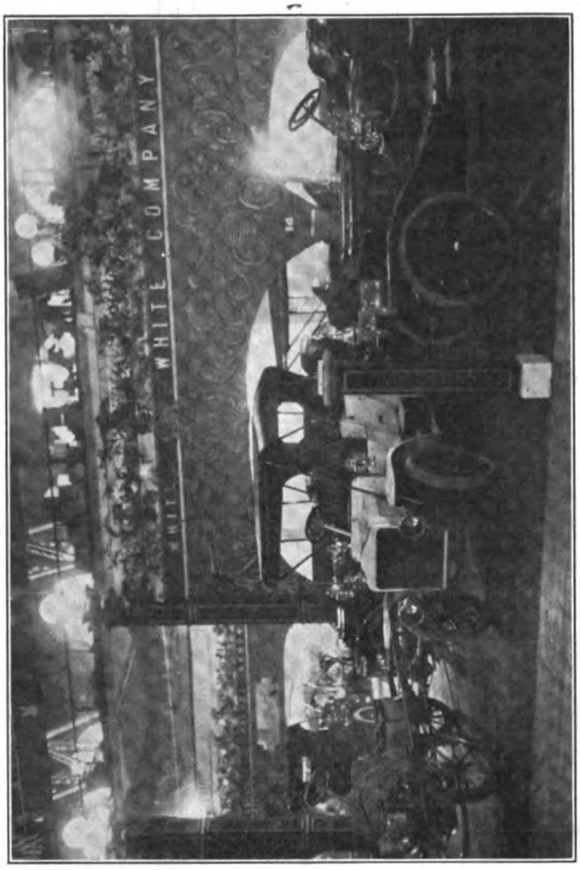
Nordyke & Marmon Co., Indianapolis, Ind.—Marmon gasolene cars.

Oakland Motor Car Co., Pontiac, Mich.—Oakland gasolene cars.

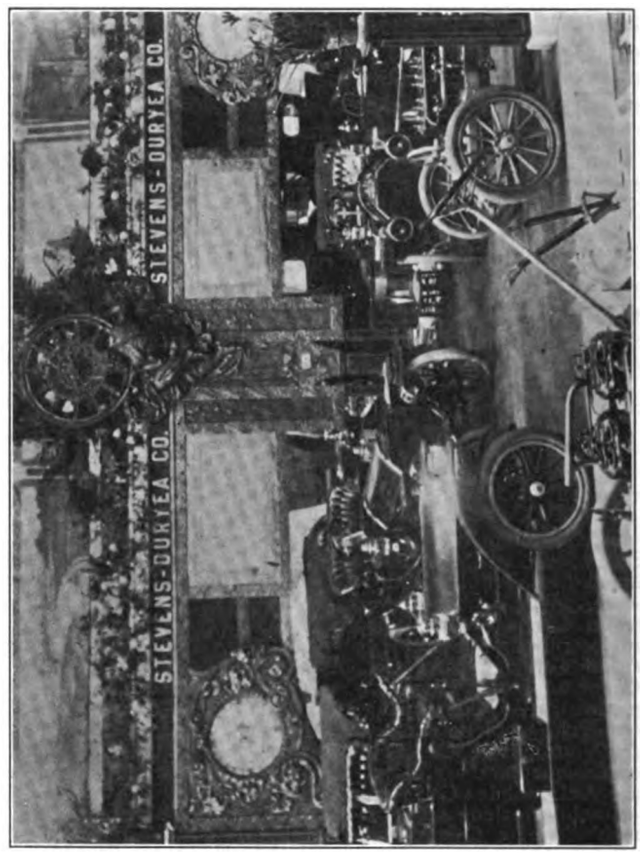
Olds Motor Works, Lansing, Mich.—Oldsmobile gasolene cars.

Overland Automobile Co., Indianapolis, Ind.—Overland gasolene cars.

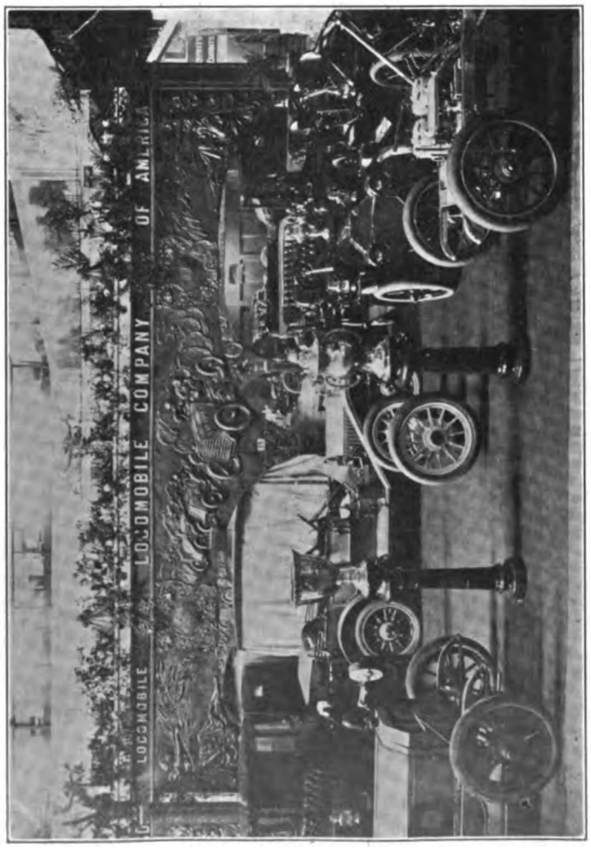
Packard Motor Car Co., Detroit, Mich.—Packard gasolene cars.



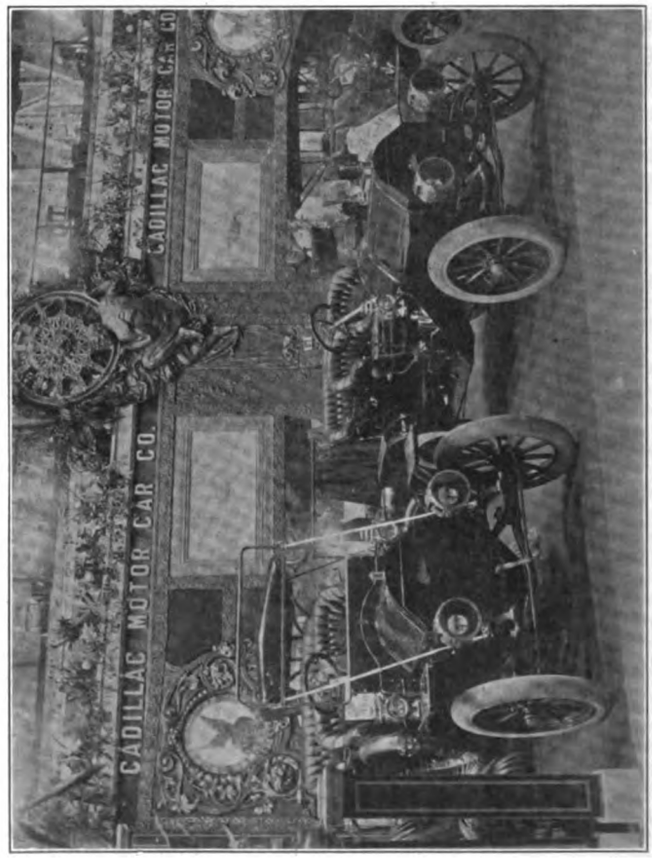
Peerless Motor Car Co., Cleveland, O.—Peerless gasolene cars.



Pennsylvania Auto-Motor Co., Bryn Mawr, Pa.—Pennsylvania gasolene cars.



Pierce Arrow Automobile Co., Buffalo, N. Y.—Pierce-Arrow gasolene cars.



Pope Mfg. Co., Hartford, Conn.—Pope-Hartford gasolene cars.

Wagner Motor Cycle Co., St. Paul, Minn.—Wagner motorcycles.

ACCESSORIES.

Ajax-Grieb Rubber Co., New York—Ajax tires.
American Electric Novelty and Supply Mfg. Co., New York City—Batteries, lamps and tire specialties.
Arnstein, Eugene, Chicago—Accessories and supplies.
Atwood-Castle Co., Amesbury, Mass.—Lamps.
Atwater-Kent Mfg. Co., Philadelphia, Pa.—Igniters and timers.
Austro-American Separator Co., Cleveland, O.—Gasolene funnels.
Auto Economy Co., Chicago, Ill.—Jewel storage batteries.
Auto Improvement Co., New York City—Self-starters and specialties.
Auto Parts Mfg. Co., Muncie, Ind.—B. T. K. transmissions and steering gears.
Badger Brass Mfg. Co., Kenosha, Wis.—Solar lamps.
Baldwin Chain & Mfg. Co., Worcester, Mass.—Baldwin chains and recoil check.
Bosch Magneto Co., Chicago, Ill.—Magnetos.
Bower Roller Bearing Co., Dayton, O.—Bower, roller bearings.
Bowser & Co., S. F., Fort Wayne, Ind.—Tanks and gasolene storage systems.
Brandenburg & Co., Chicago, Ill.—Motors and ignition specialties.
Breakstone, S., Chicago, Ill.—Hand soap.
Brown-Lipe Gear Co., Syracuse, N. Y.—Gears and transmissions.
Buda Foundry & Mfg. Co., Chicago, Ill.—Jacks.
Burrowes, Co., E. T., Portland, Me.—Wind shields and spare wheels.
Byrne-Kingston & Co., Kokomo, Ind.—Kingston carburetters.
Central Rubber Co., Chicago, Ill.—Tires and rubber goods.
Champion Ignition Co., Flint, Mich.—Ignition systems.
Chase Co., L. C., Boston, Mass.—Rubber cloth, imitation leather robes.
Chicago Battery Co., Chicago, Ill.—Batteries.
Chicago Recometre Co., Chicago, Ill.—Recording devices.
Chicago Welding Co., Chicago, Ill.—Autogenous welding.
Chicago Wind Shield Co., Chicago, Ill.—Wind shields.
Commercial Battery Electric Co., Chicago, Ill.—Storage batteries, magnetos.
Connecticut Telephone & Electric Co., Meriden, Conn.—Spark coils, switches and ignition specialties.
Consolidated Rubber Tire Co., New York City and Akron—Tires.
Continental Caoutchouc Co., New York City—Continental tires.
Cooks Sons, Adam, New York—Lubricants.
Cooks Standard Tool Co., Kalamazoo, Mich.—Tools.
Cotta Transmission Co., Rockford, Ill.—Individual clutch change gears.
Cramp & Sons Ship & Engine Building Co., Wm., Philadelphia, Pa.—Bronze castings and parts.
Davis Robe Co., Chicago, Ill.—Robes and steel wire armor.
Diamond Rubber Co., Akron, O.—Diamond tires.
Diamond Chain & Mfg. Co., Indianapolis, Ind.—Axles, chains, transmissions and sprockets.
Dietz Co., R. E., New York City—Lamps.
Dixon Crucible Co., Joseph, Jersey City, N. J.—Graphite lubricants.
Duff Mfg. Co., Pittsburg, Pa.—Jacks.
Edmunds & Jones Mfg. Co., Detroit, Mich.—Lamps and specialties.
Electric Storage Battery Co., Philadelphia, Pa.—Accumulators.
Elite Mfg. Co., Ashland, O.—Jacks and pumps.
Empire Automobile Tire Co., Trenton, N. J.—Empire tires.
Ennis Rubber Mfg. Co., Newark, N. J.—Tires.
Excelsior Supply Co., Chicago, Ill.—Batteries, lamps, plugs, lubricants.
Fellwock Auto & Mfg. Co., Evansville, Ind.—Bodies, wind shields and tops.
Firestone Tire & Rubber Co., Akron, O.—Firestone tires.
Fisk Rubber Co., Chicopee Falls, Mass.—Tires.
Fox Metallic Tire Belt Co., New York City—Anti-skid bands.
Flentje, Ernest, Cambridge, Mass.—Shock absorbers.
Fulton & Zinke, Chicago, Ill.—Gasolene motors.
G & J Tire Co., Indianapolis, Ind.—G & J tires.
Gabriel Horn Mfg. Co., Cleveland, O.—Gabriel horns and cut-outs.
Garage Equipment Co., Milwaukee, Wis.—Specialties.
Gemmer Mfg. Co., Detroit, Mich.—Steering gears and parts.
Globe Machine & Stamping Co., Cleveland, O.—Metal stamping specialties.
Goodrich Co., B. F., Akron, O.—Goodrich tires.
Goodyear Tire & Rubber Co., Akron, O.—Goodyear tires.
Gray & Davis, Amesbury, Mass.—Lamps
Gray-Hawley Mfg. Co., Detroit, Mich.—Mufflers and exhaust horns.
Ham Mfg. Co., C. T., Rochester, N. Y.—Lamps.
Hancock Mfg. Co., Charlotte, Mich.—Oilers.
Hardy & Co., R. E., New York City.—Spark plugs.
Harris Oil Co., A. W., Providence, R. I.—Lubricants.
Hartford Rubber Works, Hartford, Conn.—Hartford tires.
Hartford Suspension Co., Jersey City, N. J.—Truffault-Hartford shock absorbers.
Heinze Electric Co., Lowell, Mass.—Coils and ignition equipment.
High Frequency Ignition Co., Los Angeles, Cal.—Ignition systems.
High Wheel Auto Parts Co., Muncie, Ind.—Parts for motor buggies.
Hoffecker Co., The, Boston, Mass.—Speedometers.
Imperial Brass Mfg. Co., Chicago, Ill.—Pumps and fittings.
Jons Auto Co., Beatrice, Neb.—Jonz 2-cycle motors.
Jones Speedometer, New York City—Jones speedometers, annunciators, odometers, speed regulators and specialties.
K-W Ignition Co., Cleveland, O.—Ignition specialties.
Kokomo Electric Co., Kokomo, Ind.—Ignition specialties.
Knight & Co., H. C., Chicago, Ill.—Wind shields.
Lawrence & Welch, Sterling, Ill.—L. & W. tools, fittings and specialties.
Leather Tire Goods Co., Newton Upper Falls, Mass.—Non-skid covers and leather inner tubes.
Legnard Bros., Inc., Waukegan, Ill.—Auto-marine Spark plugs.
Limousine Carriage Mfg. Co., Chicago, Ill.—Bodies and tops.

Oliver Mfg. Co., Chicago, Ill.—Jacks and accessories.
Pantasote Co., New York City—Top and upholstering materials.
Pennsylvania Rubber Co., Jeannette, Pa.—Pennsylvania tires.
Pfanstiehl Electrical Laboratory, North Chicago, Ill.—Coils.
Pittsfield Spark Coil Co., Dalton, Mass.—Ignition systems.
Pratt Mfg. Co., Wm. E., Chicago, Ill.—Jacks.
Quincy, Manchester, Sargent Co., Plainfield, N. J.—Auto Cle wrenches.
Randall-Faichney Co., Boston, Mass.—Oil guns.
Perfection Emergency Tire Co., The, Chicago, Ill.—Perfection demountable rims.
Rands Mfg. Co., Detroit, Mich.—Tops.
Remy Electric Co., Anderson, Ind.—Magnetos.
Republic Rubber Co., Youngstown, O.—Republic tires.
Rochester Safety Lock Co., Rochester, Ind.—Steering locks.
Rochford & Co., Chicago, Ill.—Wind shields.

Royal Equipment Co., Bridgeport, Conn.—Raybestos friction facing.
Ross Gear & Tool Co., Lafayette, Ind.—Gears and tools.
Sager Co., J. H., Rochester, N. Y.—Supplementary springs.
Shaler Co., C. A., Waupum, Wis.—Electric vulcanizers.
Shelby Steel Tube Co., Pittsburg, Pa.—Steel tubing.
Smith, Fred, Aberdeen, S. D.—Simplex non-skid chains.
Smith Mfg. Co., A. O., Milwaukee, Wis.—Gears and parts.
Sorensen Chain Guard & Silencer Co., Chicago, Ill.—Sorensen chain guard and silencer.
Slickner, Frederic, New York City—Klaxon horns.
Sparks, F. E., Chicago, Ill.—Manufacturers' supplies.

Spicer Universal Joint Co., Plainfield, N. J.—Universal joints, magnetos and dynamos.
Splitdorf, C. F., New York City—Timers, distributors, coils and ignition specialties.
Sprague Umbrella Co., Norwalk, O.—Tops and wind shields.
Spring Strap Co., The, Chicago, Ill.—Spring recoil checks.
Standard Tire Protector Co., Saginaw, Mich.—Tire protectors.
Standard Varnish Works, Chicago, Ill.—Paints, enamel and varnishes.
Stewart & Clark Mfg. Co., Chicago, Ill.—Speedometers.
Stromberg Motor Devices Co., Chicago, Ill.—Carburetters.
Swinehart Clincher Tire & Rubber Co., Akron, O.—Swinehart tires.
Timken Roller Bearing Axle Co., Canton, O.—Bearings and axles.
Triple Action Spring Co., Chicago, Ill.—Spring leaves, supplementary springs, shock absorbers.
Troy Carriage Sun Shade Co., Troy, O.—Wind shields.
20th Century Motor Car Co., South Bend, Ind.—Wind shields.
Universal Tire Protector Co., Angola, Ind.—Non-skid bands, tire protectors.
Valentine & Co., New York City—Varnishes.
Vanguard Mfg. Co., Joliet, Ill.—Wind shields.
Veeder Mfg. Co., Hartford, Conn.—Odometers and speed indicators.
Vehicle Top & Supply Co., St. Louis, Mo.—Tops.
Vesta Accumulator Co., Chicago, Ill.—Accumulators.
Vivax Storage Battery Co., Chicago, Ill.—Storage batteries.
Warner Gear Co., Muncie, Ind.—Gears and transmissions.
Warner Instrument Co., Beloit, Wis.—Warner auto meter.
Weed Chain Tire Grip Co., New York City—Anti-skid chains.
Wheeler, F. H., Indianapolis, Ind.—Schebler carburetters.
Whitney Mfg. Co., Hartford, Conn.—Whitney chains and keying systems.
Whiteley Steel Co., Muncie, Ind.—Steel castings.
Witherbee Igniter Co., New York—"Wico" ignition specialties.

Expense of the Show Chassis.

Through long familiarity with the sight, show-going crowds have come to accept the polished chassis which usually grace the stands of the more prosperous manufacturers almost as a matter of course, and even have ceased to admire them as they used to do, now that the novelty has worn off. Probably it does not occur to one visitor in a hundred that they constitute by all odds the most expensive element in the average exhibit, considering the fact that they are useful only for show purposes and frequently can be used but a single season. Some idea of the labor involved in producing such a model, even when of the plainest, unsectioned type, however, may be gleaned from the remark of one manufacturer, overheard at Chicago, who said, pointing to a chassis which differed from the stock type only in matter of finish: "Do you know, that thing is a pretty expensive proposition. Why, it took six men a whole month just to polish that chassis."

WEIGHT AS A SOURCE OF EXPENSE

Problems Involved in Its Adjustment to Power and Performance—How Reduction May Add to Initial Cost.

Like its horsepower the weight of a motor car is a very vague and uncertain quantity—and for much the same reason. For while it is equally easy for the manufacturer to determine what the total weight of his vehicle, including its full equipment, is no one, not even the maker himself, knows exactly what the ratio between the power and weight of the car ought to be, so that there is no possible check upon exaggeration. Hence the temptation to foster the impression that the ratio is high either by allotting a high power rating to the motor or by giving it a nominal value so absurdly low that it will be accepted readily as ultra "conservative." The importance of ascertaining definitely the value of this factor was brought out with marked clearness in a canvas of the economics of weight reduction presented in a paper read before the recent meeting of the Society of Automobile Engineers in New York, by F. D. Howe.

"How much can we afford to spend to save weight in an automobile?" the author inquired. "I don't know. When one starts to investigate, instead of reaching a definite conclusion, he raises a hydra-headed brood of questions:

"What automobile? What weight? Whose money are we spending? What does gasolene cost where it is to be used? What roads is it to be driven over? At what speed will it be run? What grades will it have to climb? What tires will be used, and what will they cost, and what is their load-life curve?

"Now some of these questions have no definite and well-defined answer. Others do. For instance, if the manufacturer is to stay in business, we know that, in the long run, the money that he spends must come out of the pocket of the man who buys the car, and so the primary question is: How much per pound can the buyer afford to pay for cutting weight out of his car? And second, can he be brought to realize the fact and give up the money?

"Weight is an expense to the user of a car in many ways: (a) He must pay for gasolene to move it around; (b) He must pay for tires to carry it; (c) It reduces hill-climbing ability; (d) It reduces speed on soft roads materially, and on a smooth, hard road to a much less extent. It wears out clutches in starting and brakes in stopping. It increases the time required to get up to speed, and in general makes the car less readily handled in traffic.

"Each of these items will vary in importance with different conditions, but we may make certain assumptions that will enable us to reach an approximation to their value. Let us assume for a pleasure vehicle a life of 50,000 miles on which to base gasolene and tire expense. The cost of fuel to haul a pound of weight 50,000 miles will vary with road conditions, speed, carburetter adjustment, etc., as well as the efficiency of the driving mechanism and tires, so that we shall have to make another assumption based as far as possible on average performance.

"In the Chicago Economy Contest of 1907, the average gasolene consumption was about 32.5 ton-miles per gallon, varying from 47 to 19 A similar average, with less difference between the extremes, obtained in an Australian contest, while the Cleveland sealed bonnet contest over very poor and muddy roads gave an average of 16.8. If we assume a fuel efficiency of 30 ton-miles per gallon and a price of 15 cents per gallon, it will cost 12.5 cents for gasolene to move one pound around during the life of the car under fair touring conditions.

"I am not aware of any extensive tests on which we may rely for data concerning the life of pneumatic tires. . . . . The best we can do in the present instance is to take the manufacturers' rating for pneumatic tires and add the passenger loads. These total loads divided into the cost of tires will give the cost of tires per pound of weight.

Tire	Car Wt.	Passengers	Total.	Tire Cost.	Tire cost Per lb. Wt. carried
2½x30	900	300	1200	$63.60	$ .0530
3 x30	1400	300	1700	72.20	.0445
3½x30	1800	450	2250	112.60	.0500
4 x32	2600	600	3200	155.20	.0485
4½x34	3200	900	4100	209 00	.0510
					$ .2470
Average					$ .0496

"If the car uses up eight sets of tires during its life of 50,000 miles the purchaser has no great cause for complaint, and each pound of weight carried by the tires will have cost him, in round numbers, 40 cents. These two major accounts of fuel and tires are responsible for an expense of 52.5 cents for each pound of unnecessary weight, and the purchaser can afford to pay up to that amount for weight reduction.

"The wear on clutches and brakes would depend very much on their design but with a given design would seem likely to be proportional to the weight to be started and stopped. Whatever saving there may be in wear and adjustment we may throw in with the satisfaction due to snappy acceleration and improved hill climbing ability, and call it interest on his 52.5 cents for a period equal to half the life of the car. . . . . "

From published data on the subject and with the aid of a number of assumptions of his own, the author further is able to deduce these costs per pound total weight of car and load for the commercial vehicle, the headings indicating the rated load capacity of the machine, the totals in each case corresponding to that just given for the pleasure type:

	500 lbs.	15,000 lbs.	3,000 lbs.	6,000 lbs.	10,000 lbs.
Gas	$ .30	$ .235	$ .178	$ .118	$ .105
Tire ...	.75	.625	.46	.263	.189
	$1.05	$ .860	$ .638	$ .381	$ .294

"So much from the standpoint of the purchaser and user," he continues. "The manufacturer's problem is to make the machine that will be the most profitable to himself. If he were to make a commercial automobile, cutting the weight down by careful design and high grade material to the point of most economical service, he might have difficulty in making sales, for there are many who are called good business men who cannot see very far beyond a big first cost. Pleasure vehicles, however, built on this plan sell well, for the same business man will spend money freely on a car for transporting his own person.

"For every purpose, there is a theoretical car of the lowest possible first cost compatible with the necessary strength and reliability. In this car the grade of materials is so chosen and the design is so worked out that it will cost money, either to add weight, on account of increased cost of material, or to reduce weight, on account of either the increased labor cost in cutting out the metal, or increased material cost due to the higher grade and more expensive metals used.

"This cheapest possible car will not be such a bad proposition, as the term implies, for we have assumed that it has the necessary strength and reliability. It will probably be a most profitable one for the manufacturer who can build them in very large quantities. In fact, mass production with well worked out design and the best special tools and fixtures are essential. If ten thousand parts are to be made without change, the saving of one cent on each balances an initial outlay of $100 in the designing or tool department. An hour's time saved in making a pattern or core box may cost hundreds of dollars in extra metal, while a few minutes saved by the draftsman making his drawings the easiest way, rather than the correct way, may be equally expensive.

"But strong, reliable and cheap as this car may be, it is by no means the best bargain for the purchaser. Just what is the curve of cost of weight reduction is unknown, but I fancy it is something like a parabola; certainly when working near the origin of the curve, considerable results are obtained by a slight outlay, for even as weight begets weight, so weight saved in one part saves material and cost in another part.

"In solving this problem for individual cases, we need a set of curves of weight and fuel consumption for vehicles of similar design. The assumption made in this paper, of a uniform or average consumption of

Digitized by Google

30 ton-miles per gallon for pleasure cars, is manifestly unsound.

'The heavy cars do better, light ones not so well. But along with the differences of weight go variations in design which vitiate any attempt to draw inferences as to the law governing the relation of weight to fuel consumption. Take the case of the Chicago economy contest in which a number of cars ran for two days under similar conditions. The weight and fuel consumption plotted out looks like a target made by a very poor shot gun, but the average would indicate that the fuel consumption is about inversely as the weight. That is, the heavy car should go as far on a gallon as a light one. We know that this is not necessarily so and we also know that a given car will go further lightly loaded than with a heavy load. Does anyone know this load, mileage, or consumption curve for any particular car or design?

"We also need a set of load-life curves for tires, both pneumatic and solid, a sort of mortality table like that which guides our friend, the insurance actuary. Like that table, it must be based on a great number of individual cases. Now each member of this society has one or more sets of tires under observation, the data from which he could forward to the secretary, who would plot the curves when sufficient material to make them reliable had been obtained. This is a small effort for each of us individually, but the results would be of great value to us all."

What Mysterious Noises May Mean.

Mysterious noises emanating from the running gear of a car, usually denote a want of lubrication in the springs or universal joints. When the springs require lubrication, and no grease channels are provided, the frame should be jacked up to remove the weight from the leaves, and grease introduced between them, by means of a knife blade. Oil also should be used, as it will penetrate into inaccessible crevices and is not liable to be forced out between the leaves, when the weight of the car is placed on the springs. In all well designed cars, provision is made for lubricating the universal joints and where grease cups are employed they should be so fastened as to preclude the possibility of their becoming lost, through the action of centrifugal force.

To Loosen up Multiple Disc Clutches.

In cars equipped with multiple disc clutches there is sometimes difficulty experienced in starting after the car has been standing for a time, as the pressure of the springs forces the plates together to such a degree that they do not let go readily when the clutch pedal is depressed, making gear shifting somewhat ticklish. This tendency may be obviated by applying a mixture of kerosene and thin oil to the clutch, which now may be inclined to slip, and to counteract which thick oil should be added until a positive grip is secured.

EXPERIMENTS IN CARBURATION

Results of Simultaneous Tests in Three University Laboratories—Ratio of Air in Effective Mixtures.

Experiments carried out at the laboratories of three different universities, in each of which his own engines have been installed are proving beneficial to an enterprising automobile manufacturer in two different ways. In the first place comparison of these tests, carried out under similar conditions and thus furnishing a cross check upon each other, affords the builder some very useful data upon which to base future calculation and design. In the second place, students who have chosen the automobile field for thesis subjects, often are given opportunity for vacation work at the company's plant, thus extending their familiarity with the engine with which they already have become acquainted.

In the mechanical equipments at Cornell University, the University of Michigan, and Syracuse University, Franklin engines have been placed and the tests mentioned are made up and carried out under the supervision of the engineering department of the H. H. Franklin Manufacturing Co., Syracuse, N. Y., as a result of which, a good opportunity is afforded them of securing promising material for future enlistment on the firm's payroll. An outline of some of the work is indicative of the general method of the system and also of the benefit which is being derived from it.

In investigating the subject of fuel mixtures, for example, all tests were of thirty minutes duration. All air supplied to the carburetter was accurately metered and the gasolene consumption was carefully measured. The temperature of the air entering the carburetter was maintained as nearly constant as possible, and readings were made every two minutes. The brake was then read, and the temperature of the air entering and leaving the hood was taken. The engine speed was kept as nearly constant as possible in all tests.

Samples of exhaust gases were taken at the beginning, after ten minutes and at the end of each test. In each case the ratio of air to gasolene was checked by calculation from the analysis of the exhaust gases, the average analysis being used for this purpose. The tests were made in two series, one under constant speed and variable horsepower and the other with maximum horsepower and variable speed. Figures prepared show tests made at 1,000 revolutions per minute and twelve horsepower.

Five thirty-minute runs were made. In run No. 1 the gasolene adjustment in the carburetter was shut off as much as possible and have the engine run without missing or popping back or cause any trouble. In run No. 5 the needle valve was open as far as possible and still maintain twelve horsepower at 1,000 revolutions per minute. The three intermediate runs were made somewhere between the two extreme runs, and the results were used for the platting of curves.

The gasolene consumed in the first run was about 3,000 cubic centimeters, and it was shown in test No. 5 that it was possible to get the same horsepower with the same length of run and the same speed and yet burn nearly twice as much gasolene. In applying this to road work it is found that it is possible to go twenty miles on a gallon of gasolene or go ten miles on the same quantity and under the same conditions.

This is a laboratory proof of the everyday incident of one man using twice as much gasolene as another to accomplish the same result. The excess of gasolene going through the motor might cause a good deal of heating, but if its use is possible in a laboratory with no fan other than that on the motor itself the same results can be obtained on the road without an extremely harmful outcome.

As to where this gasolene goes that passes through the motor, it is shown by the exhaust analysis that the combustion is incomplete. In the first test the loss due to incomplete combustion is approximately 1 per cent., and in the last test the similar loss is 15 per cent. The first test shows a thermal efficiency of 17 per cent. and the last one of 9 per cent. The ratio of air to gasolene, by weight, under the first test approaches closely the correct proportion according to the analysis of gasolene. In other words there is no excess in any of these tests. Generally speaking, it has been found advisible to run a certain percentage more of air than is required theoretically to make complete combustion, but in none of these tests has any excess of air been found. The theoretical amount of air necessary to make complete combustion with the gasolene used is 14.90 parts of air to one part of gasolene.

In each case the Franklin company has set up the engine and made such arrangements as to obviate any great amount of work in preparation for the tests Inasmuch as the tests vary from year to year, however, there is each year a certain amount of special apparatus which has to be built.

Denatured Alcohol a Smokeless Fuel.

Denatured alcohol prepared with boric acid was recommended for fuel purposes by Professor Irving W. Fay in a lecture on the oxygen compounds of the hydrocarbons delivered last week in connection with his Brooklyn Institute course on organic chemistry. "When gasolene burns there should be no odor left behind," he said, "and when a trail of smoke is left behind we know that the man is wasting his gasolene. Alcohol burns without smoke, and for various reasons the acid makes a suitable addition to it."

YELLOWSTONE PARK FOR TOURISTS

Cheyenne Industrial Club Urges Opening of the Reserve to Automobiles—Invites Co-operation of Other Bodies.

Attempts to hasten the inevitable opening of Yellowstone Park to automobiles without compelling the entire taking out of the engines, are being made. Quite a big campaign with this object in view has been started by the Industrial Club of Cheyenne, Wyo., which is urging the co-operation of automobile clubs, commercial bodies and good roads associations.

"At the present time," the Cheyenne agitators explain, "the rules make it necessary for the removal of the engines from automobiles immediately upon entering the Park and for the employment of drivers and teams to haul the engine and automobile as separate conveyances through the Park at a speed of probably eighteen to twenty-five miles per day and at a very great expense and loss of time. The American people are beginning to realize that Yellowstone Park is one of Nature's wonders, and we believe that the time has come when the automobile owner should be recognized.

"The Wyoming delegation in the National Congress is being requested to urge legislation whereby appropriations can be made at once for the establishment of public roads and the maintenance of the same in the park. Statements are made in correspondence now in our hands, being in the form of official reports from those in charge of the park, that the grades and roads were dangerous and that if automobiles were permitted in the park under present conditions it would be a practical prohibition of tourists who might desire to travel by horse and wagon. Such statements are made by General Young, superintendent of the park. We find that in the opinion of the Secretary of the Interior that this statement is correct, and yet as against that we have statements from men who have made the journey that the grades are not dangerous and impassable for automobiles. We believe that the whole matter should be investigated.

"In this connection, this club is starting an agitation, hoping to secure legislation in the State legislature of Wyoming during the coming session by which it will be possible to build a great State highway from east to west through Wyoming, with roads leading from this highway into the park and thus encouraging the ultimate building of a great National highway from coast to coast for tourists and especially automobiles."

Racing in Mud at San Bernardino.

Looking at the mud on the track, Barney Oldfield told the people at San Bernardino, Cal., on Sunday, 31st ult., that they would again have to wait a week before they could see him drive. Some 600 spectators, many of whom had come long distances, said otherwise, and Barney was finally persuaded to give them an exhibition. He brought out the Christie creation and before he could make enough rounds on the track to spatter even half the spectators with the mud spray it kicked up, the machine blew out a cylinder head with a bang and had to retire.

This put the crowd in bad humor, but the semblance of a race program was finally arranged and Oldfield defeated his co-stars, Siebel and Seyfried, in a "sweepstakes", driving a White stock car. Seyfried, in the White Flyer, made the best time of the day in the exhibition mile, making the distance in 1:06. The machine later broke a pinion as the result of the mud plowing. Several stock car contests with close finishes strengthened the entertainment.

Five New Measures at Albany.

Five automobile bills were introduced at Albany Monday, in the Assembly by Beverley R. Robinson, who acted on the suggestion of the law committee of the Automobile Club of America. The purpose of the bills, Robinson says, is to straighten out defects in the present motor vehicle laws.

The first of the bills puts all motorists in New York on the same basis and provides that the contribute the same registration fee. The second provides for the abolition of any specific mile an hour rate and makes everybody on the highway responsible for a rate of speed reasonable and proper. The third bill provides that all fines collected from automobilists shall go to the State, to be used for the maintenance of good roads.

The remaining two bills are aimed at "joy riders." One makes it a misdemeanor for a chauffeur to take out an automobile without the consent of the owner, and the other makes it a misdemeanor for any one to tamper with automobiles without the consent of the owner or to cause injury to a motor vehicle.

Dangerous Tactics of Rural Georgians.

One hundred dollars reward has been offered by the Chatham county commissioners at Savannah, Ga., for the arrest of the persons responsible for a recent case of putting a wire across one of the public roads which form part of the racing circuit. The wire was stretched tightly across the highway, and had a car encountered it at speed, the occupants would probably have suffered terrible injuries. The efforts of the rural residents to make speeding dangerous have attracted official attention.

Always Prepared to "Get a Horse."

Fear of being stranded in the country with exhausted batteries and no means of getting home has induced an electric vehicle enthusiast of Ravenna, O., to alter his victoria in such a way that shafts may be attached to it at any time. The necessary extra equipment carried under the body.

STATE SEEKS INTERCEPTED FINES

New Jersey Begins Prosecution of Justices Who Fail to Make Returns—City of Newark a Delinquent.

Another Jersey justice who had become proficient in the art of "forgetting" to make to the State an accounting of fines which he had collected from motorists during the past summer, has been called to account. On complaint of the Quaker City Motor Club, which has been conducting a vigorous crusade, Justice Schmitz, of Camden, was taken into custody last week and held in $300 bail on a charge of retaining $50 of fines which he had collected. Schmitz disclaims all intent of fraud in the matter and declared it was through a lapse of memory that he did not turn in the money in this particular case.

In connections with the investigations it also has been brought to light that the city of Newark has been delinquent in the matter of making returns to the State of fines collected from automobilists. In the past it has been the custom of the police court clerk to turn all moneys collected for fines into the city treasury. Steps have now been instituted by the State authorities to recover all that is due it for fines under the law. The New Jersey Automobile and Motor Club was active in bringing the matter to the attention of J. B. R. Smith, commissioner of motor vehicles, who, when the facts were presented to him, immediately took prompt action.

Washington to Regulate Taximeters.

An initial move in the inevitable flood-tide of legal regulation of taximeter instruments has been made by the District Commissioners of the District of Columbia in a regulation prohibiting the use of inaccurate taximeters and providing for a maximum penalty of $40 for the owner or company owning an automobile upon which such an instrument is used. The measure provides that no taximeter shall be used, until a guarantee of its accuracy shall have been filed with the hack inspector at police headquarters and that all taximeters shall be at all times subject to inspection by the police department.

Pennsylvania Roads Open to Motorists.

No borough or township, in Pennsylvania at any rate, has authority to close to automobiles any highway that has once been opened, according to a decision of Judge Robert S. Frazer, in Pittsburg. As a result of the decision, motorists may run their machines along the Little Sewickley road in spite of the Sewickley township ordinance to the contrary. The court declared that the act imposing a State tax for the use of automobiles gives to the owner the right to traverse any highway in the State.

SUES TO RECOVER ENTRANCE FEE

Mora Company Furnishes a Sequel to the Vanderbilt Cup Race—Grounds of the Suit and the Defense.

At practically the same time that the Long Island Motor Parkway company was released from its $25,000 bond imposed by the board of supervisors of Nassau county as a liability fund before the sweepstakes and Vanderbilt cup races could be run last fall, the Vanderbilt Cup Commission was made defendant in a suit for $500 in connection with the Vanderbilt event. Suit was brought against the members of the Vanderbilt commission last Friday by the Mora Motor Car Co., of Newark, N. J., seeking to recover the company's initial payment of $500 for an entry in the race. The company claims that owing to the uncertainty about the holding of the race, due to the difficulty between the American Automobile Association and the Automobile Club of America, it decided not to go ahead with the building of its special racing car after it had paid the first half of its $1,000 entry fee. It notified the commission of the reason for failing to complete the entry and asked the return of its money. The latter not being forthcoming, legal action was decided upon.

All the individual members of the commission were made defendants in the suit, although so far only Jefferson DeMont Thompson and Frank G. Webb have been served. Chairman Thompson says that the commission will contest the suit on the ground that on its side the conditions for the race were fulfilled. He states that the payment was made on May 25 and that the notification that the Mora desired to withdraw did not come until September 24, and declares that the proviso in the race conditions to the effect that half the fee must accompany the entry and would be forfeited in the event of failure to take part in the race was made expressly to prevent just such happenings.

Motor Car Helps the Seller of Land.

More than the salesman of any other commodity the man who sells real estate has a momentous transportation problem in bring possible customers to take a look at his offerings. On this account real estate men generally take the lead in the adoption of the automobile for business uses. They reckon a saving both in money and time from its use, but its cheif recommendation is that with it they can get a customer who is on the verge of buying to the property in question and make a deal promptly while he is in the mood.

The question of expense is not great generally speaking; but a real estate man in Boise, Idaho, has set out to settle even that. He is Edward Stein, who for the past year has kept an accurate account of an 18 horsepower, four-cylinder Franklin which he has owned and operated during that time. The result of his year of automobile bookkeeping is a showing that it has cost him $45.11 a month to run his car. This includes $36 in insurance and the purchase of storage batteries at a cost of $27. Outside of these items, the monthly cost has been only $32.07. In the coming year he expects the monthly figure to be about that which he has paid in the past for keeping a horse and carriage, $28 a month, although he figures on getting three times the service.

Classes to Qualify Colored Crauffeurs.

Special classes for colored chauffeurs are to supplement the schedule which the Pierce Arrow Motor Car Co., of Buffalo, N. Y., has arranged in connection with its school of automobile instruction. The plans for the present year are more comprehensive than any the company has made heretofore. Classes begin February 15 and each one lasts for two weeks. The work of instruction includes detail lessons regarding the car, its assembly, maintenance and driving. The time between May 3 and 22 is for owners exclusively, while April 5 to 17 is given over entirely to colored men, the classes for garage men and chauffeurs occupying the rest of the school program.

The Week's Patents.

901,527. Cover for Pneumatic Tires. Isaac J. D. Fairhurst, Orfordville, Wis. Filed Feb. 28, 1907. Serial No. 359,868.

A tire cover having a reinforcing strip in its tread portion, combined fastening and armor rivets securing said reinforcing strip to the cover and forming a protective armor on the outer side of the latter with abutting hexagonal plates secured on the projecting ends of said rivets, reinforcing anti-skidding washers arranged on said armor plates and washer retaining heads formed on the outer ends of said rivets, said heads also forming anti-slipping projections, substantially as described.

901,578. Steadying Device for Supplementary Vehicle Springs. William Young, St. Louis, Mo., assignor to Supplementary Spiral Spring Company, St. Louis, Mo., a Corporation of Missouri. Filed Dec. 26, 1906. Serial No. 349,380.

1. In a device of the character described, the combination of an auxiliary spring, means for attaching same to the vehicle, means for connecting same to the main spring, said means being in connection with one end of said auxiliary spring, and means secured to said second mentioned means adjacent the point of connection thereof with said auxiliary spring, said means extending to the body of the main spring.

901,591. Anti-Skidding and Slipping Attachment for Automobile Wheels. Harry H. Chandler, New York, N. Y. Filed Dec. 27, 1907. Serial No. 408,302.

An anti-skidding and slipping device for automobile wheels comprising a leather strap adapted to be secured around the spokes adjacent to the rim of the wheel, snap hooks connected with said strap at the opposite sides of the spoke and extending downwardly and across the rim, said strap hooks being provided with oblong heads having oblong slots or openings through which the strap is passed, and a flexible drag connected with said hooks and passing around the tire of the wheel, said strap being also provided with inner members which separate the heads of the hooks from the spoke.

901,616. Supplemental Hood for Automobiles. Charles L. Hobbs, Chicago, Ill. Filed Feb. 14, 1908. Serial No. 415,807.

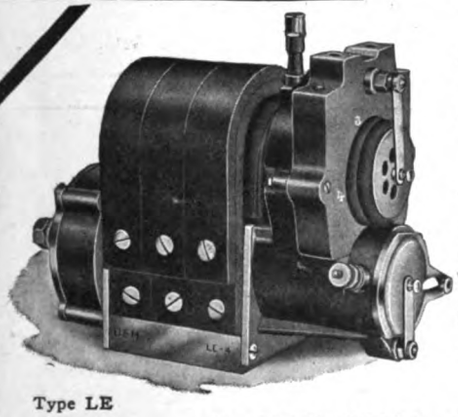
1. A supplemental hood for an automobile hood, consisting of a heat insulating covering adapted to be applied to substantially the entire outer surface of the automobile hood, and detachably connected thereto.

901,654. Grip Tread for Pneumatic Tires. Berton H. Sills, Ottawa, Ontario, Canada. Filed Dec. 14, 1907. Serial No. 406,580.

1. An anti-slipping device for vehicle wheels, comprising transverse chains to pass across the tread of the wheel, annular chains on each side of the wheel but disconnected therefrom, bolts on the extremities of the transverse chains extending through the annular chains, and rotatable with respect thereto, whereby the bolts and transverse chains are free to rotate about their longitudinal axes as they creep around the periphery of the wheel.

U & H MAGNETOS

IT USED TO BE HARD WORK



to start the engine. That was the fault usually of the carburetor—sometimes of the ignition.

Today it is apt to be hard work for the owner of a magneto to start without recourse to a battery. That is simply because he must "spin" the crank to get a spark.

The second difficulty is as irrational as time proved the first to be, and the solution of it is not found in adding the complication and expense of a battery.

The owner of a U & H SELF-STARTING MAGNETO, TYPE LE, gives the crank an easy half turn and gets as hot a spark as if traveling at racing speed, and the spark is automatically retarded past the center wherever the spark advance lever may be.

That is common sense!

Type LE

901,670 Brake Mechanism. Alberto Balloco, Turin, Italy, assignor to Societe Anonyme "Itala" Fabrica di Automobili, Turin, Italy. Filed April 16, 1907. Serial No. 368,557.

1. A brake mechanism of the character described comprising a guide member, an arm adjacent to the end of said member, said arm being capable of swinging movement and having adjacent to its outer end a part adapted for engagement with a flexible connector to guide the same, a grooved sheave carried by said arm adjacent to the end of the guide member, and a flexible connector extended along said guide member and passed around the grooved perimeter of the sheave adjacent to the end of said member, and extended from said sheave along said arm in position for engagement with said part at the outer end of the arm and adapted for connection with a brake device.

901,735. Vehicle Frame. Charles J. Pembrooke, Rochester, N. Y. Filed Sept. 10, 1907. Serial No. 392,109.

1. In a vehicle frame, the combination with a yieldingly supported main frame, having an upwardly projecting frame at the rear thereof, of a seat carrying frame pivotally mounted at its front end and yieldingly suspended at its rear from the upwardly projecting frame.

901,751. Spring Wheel. John E. Stannard, Springfield, Mass., assignor of one-half to Francis J. Millea, Springfield, Mass. Filed Aug. 19, 1907. Serial No. 389,144.

1. A spring wheel comprising a hub, a rim provided with inwardly projecting members, a plurality of independent heart-shaped springs closed at their apexes and severed at their indented ends to receive such inwardly projecting members between them, means to attach such apexes to said hub, and means to fasten the severed terminals to said inwardly projecting members.

Soot-proof Spark Plug

The only spark plug that cleans itself automatically. Put it in your auto and be free from ignition troubles.

C. A. MEZGER, Inc., 1629 Broadway, New York

What Magneto Won the World's 14 Foremost Racing Events of 1908?

THE BOSCH

Did, Of Course!

From a total number of 511 cars entered, 434 were equipped with Bosch Ignition.

From a total of 313 cars that finished, **290 or 92 6/10%** were equipped with Bosch Ignition.

It follows that Bosch Ignition rightly enjoys the confidence it deserves.

Its record is one of constant reliability.

The figures given above are based on the following races:

UNITED STATES—Florida Meeting (Ormond Race), New York-Paris Race, Savannah Grand Prize, Both 24 Hour Races at Brighton Beach, Glidden Tour.

FRANCE—Grand Prix de l'A. C. F., Coupe des Voiturettes de l'Auto.

ENGLAND—Fiat-Napier Match, Isle of Man Race.

ITALY—Coppa Florie e Targa Bologna.

GERMANY—Prince Henry Race.

AUSTRIA—Semmering Hill Climb Race.

RUSSIA—St. Petersburg-Moscow Race.

WINTER SUGGESTIONS

We have a large line of Leather Clothing, Caps, Gloves, Wool Vests, Wool Boots, Ways Mufflers, Storm Coats, Lap Robes, Etc.

ARGYLE AUTO BOOTS

Worn over Shoes for Comfort in Cold Weather Motoring.

The ARGYLE Auto boots are designed to give the motorist's feet complete protection from the elements during winter weather motoring. They are worn over the ordinary shoes and can be pulled on or off very readily. They will keep your feet warm and dry during the longest ride in coldest weather. You cannot realize the comfort they give in frigid weather, till you have worn a pair.

Every man, woman and child who motors in cold weather needs a pair of ARGYLE Auto Boots, no matter whether the time of exposure is a half hour or a whole day.

They are made of fine flexible leather, have strong leather Goodyear welted soles and are warmly lined throughout with genuine lambs-wool.

Made in all sizes, with long or short leg. Length of the long leg is 13½ inches,, and the short 10½ inches.

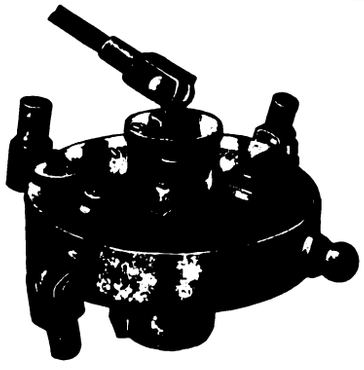
PRICES:

Long, per pair $9.00
Short, per pair 8.00

NO. 19 AUTOMOBILE GAUNTLET GLOVE

This illustration shows our No. 19 Gauntlet Glove, which is a black, seamless knit lined Automobile Gauntlet with extra large flexible cuff with 2 fastenings. This Gauntlet is made from the best selected imported black cape leather. It has a 7-inch Gauntlet with extra large cuff, 20 inches in circumference, which may be adjusted to smaller sizes. The cuff is lined and is guaranteed not to crack, and is stitched with genuine silk.

It will also be noted from the illustration, that the wrist is fitted with an elastic band, which will keep the Gauntlet tight, and comfortable on the wrist, and prevent it slipping down over the fingers.



The cuff is also flexible, and can be rolled into a small space, as shown in the small illustration, for carrying in the pocket. This is the finest Gauntlet Glove on the market.

Price, seamless knit lined, per pair $3.50

The Warner Auto-Meter

1909 Style

Guaranteed
Absolutely Accurate

is the only speed indicator made on the Magnetic Induction principle. Because of the principle it accurately indicates every range of speed from zero to the maximum.

All other instruments are made on the centrifugal principle. They fail to indicate any speed whatever under 5 to 10 miles per hour.

The Auto-Meter is so durably made that practical tests have shown that it will endure a **MILLION MILES** of riding without perceptible wear, or departing from absolute accuracy more than 10 feet to the mile.

We invite comparative tests. Before you decide on any Speed Indicator, put the Auto-Meter on one side of your dash and any other indicator at any price on the other. Then use your watch over a measured course. Keep the instrument which **tells** the **truth.** We know which it will be.

Some Reasons Why the Remy Magneto Is Better Than Imported Magnetos For American Cars

IT HAS LARGER margins in its construction, electrically and mechanically, and does not have any delicate or sensitively adjusted parts.

IT PROVIDES FOR a double ignition system, consisting of both Magneto and battery, in the simplest possible way, not requiring additional wiring of any kind, as do all imported Magnetos where double ignition is used.

IT CAN BE installed, used or repaired by th most inexperienced motorist, with the certainty of satisfactory results.

IT CAN BE literally flooded with water or oil without injury. Too frequent oiling cannot injure it, as it will a more delicately constructed Magneto.

IT IS AN American Magneto, designed with the board margins that automobiles used on American roads require.

IT MAKES A hotter spark and permits of a larger range for advancing and retarding the spark.

IT IS GUARANTEED in a way that means something.

MORE OF THEM have been sold for American cars than all other makes of Magnetos combined.

Remy Magneto Under Water For Hours, Starts Motor on Second Turn of Crank

New Orleans, La., Jan. 16, 1909.

REMY ELECTRIC CO.,

Gentlemen: It may be interesting to you to know of some of the hardships to which your Remy Type L Magneto was subjected to, while on my trip South with my car.

A Commutator and coil system would have been utterly useless, especially at such times as when my car was buried in water over the Magneto and motor, for some times as long as four hours. It is remarkable to relate that at such times when we pulled the car from the water, by the aid of ropes, mules, and various methods, upon freeing the motor from the water with which it was filled (crank case and cylinders) and drying the spark plugs, that the motor would invariably start on the second turn of the crank from the Magneto, our batteries having been ruined from the long immersion in the water.

It is a fact that the above performance was repeated a number of times on our journey through the swamps of Florida. The first time we got the car submerged in water covering motor and Magneto, we fully expected that we would be compelled to remove the Magneto and thoroughly clean and dry it before we would be able to continue our journey.

You can imagine our surprise, when we thought we would at least try the thing before taking it off, and the motor started on the second turn of the crank. We just threw our hats and hurrahed for the Remy Magneto.

We are firm in our belief that no other ignition system could have taken our car through such trying condition without constant attention and an almost continual round of troubles, as the writer's experience with other ignition systems in wet weather firmly convinces him what would happen under such trving conditions as stated above.

My car ran a total of three thousand miles, and all the attention your Magneto required, was a few drops of oil occasionally, through mountains and sandy wastes, on low speed hours at a time without missing an explosion, sometimes the motor running at maximum speed. Our ignition system was a matter of which we rarely gave thought.

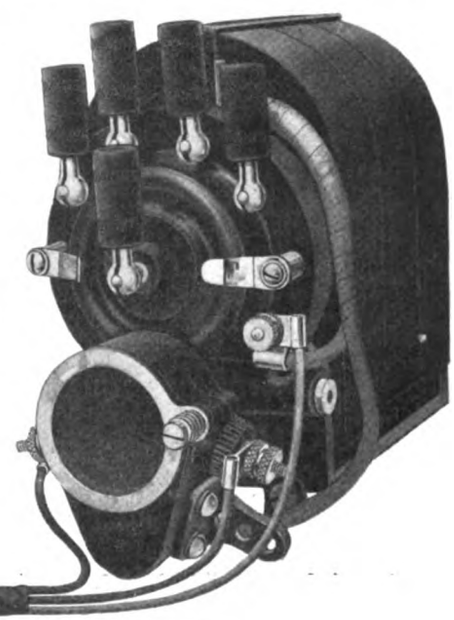
Wishing you continued success, which we are assured is yours, we are,

A. T. MOSHER.

Remy Magneto Best in Severe Tests Says Robert Burman

Famous racing pilot who led all American contestants in Light Car Race at Savannah, pays tribute to Remy Magneto, after series of successes in car equipped with this ignition system.

Flint, Mich., Jan. 2, 1906.



REMY ELECTRIC CO.,

Gentlemen: I have used your magneto for the past season on the Buick cars in racing and it has proven the best in the severe tests in which it has gone through. I have put the Remy through several 200 and 250 mile races and it has never had a minute's work done on it. It has never been readjusted even. I tried out other magnetos in the late Savannah races, but fell back on the Remy, because I knew that it was faster and had better staying qualities.

I was out practicing one morning and was trying out another make of magneto, when it went to the bad about one mile from our camp.

I sent my mechanician to the camp after a Remy, which I put on, and started out for a fast lap. The magneto was so fast that I could not keep the car in the road and struck a tree, chopping the car in two parts, and that is the only fault which I have to find with Remy Magneto.

R. BURMAN.

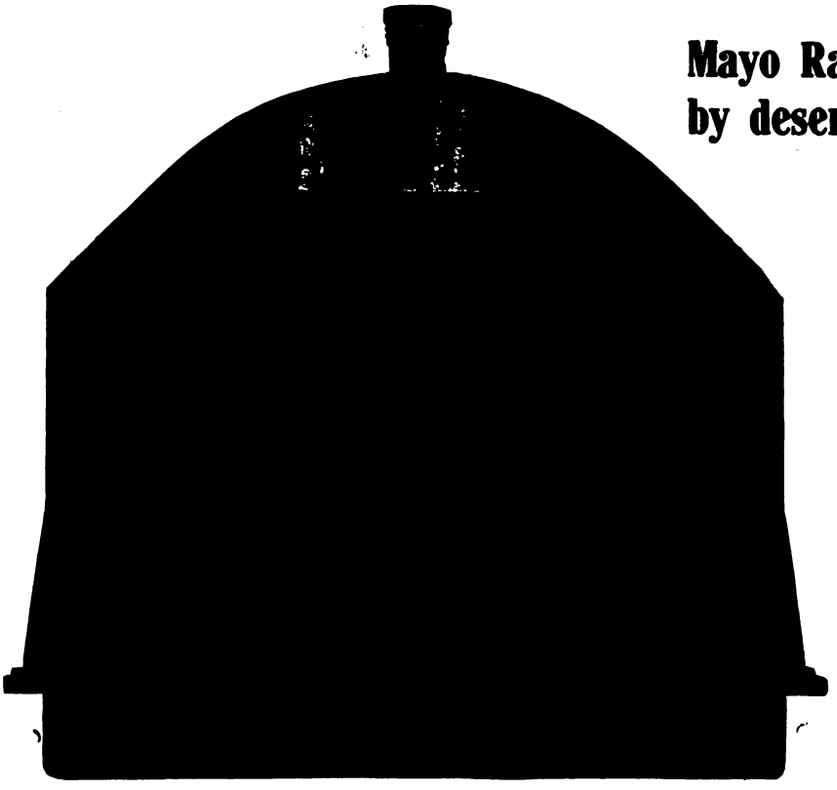
These are only samples of hundreds of letters received from satisfied drivers, manufacturers, agents and car owners.

The following firms are on the rapidly increasing list of those who use the Remy Magneto in large quantities:

Buick Motor Co.	Apperson Bros. Automobile Co.	Crawford Auto Co.
Maxwell-Briscoe Motor Co.	Overland Automobile Co.	Olds Motor Works.
Regal Motor Car Co.	Cameron Car Co.	Model Automobile Co.
Midland Motor Car Co.	Kissel Motor Car Co.	Buckeye Mfg. Co.

20,000 Remy Magnetos Sold For Use On 1909 American Automobiles

We furnish complete equipment for attaching the Remy Magneto to many of the old cars and also the new 1909 models that are not regularly equipped.



For more complete description about this most highly perfected Magneto write today to

REMY ELECTRIC CO., Dept. 11, Anderson, Ind.

Branch Office in Thoroughfare Building, Broadway and 57th St., New York City.

1895—(1) First prize, $150, for balanced motor, awarded by Chicago Times-Herald. (2) Speed Record, Louisville, Kentucky.
1897—(3) Speed Record, Charles River track, Boston, Mass.
1899—(4) First One Thousand Mile run made in America. This was accomplished by our phaeton, which ran from Kokomo, Indiana, to New York City.
1901—(5) Kokomo to New York City in 73 hours. (6) First Prize Blue Ribbon Certificate, Long Island Endurance run; one hundred miles during a heavy rain storm, without a single stop. (7a) First Prize Certificate in the New York-Rochester Endurance Contest. (8b) First Prize Certificate in the New York-Rochester Endurance Contest. (9) First Prize, Silver Cup, Five Mile Speed Contest, Fort Erie track, Buffalo, N. Y. (10) First Prize, Silver Cup. Ten Mile Speed Contest, Point Grosse track, Detroit, Mich. (11) Gold Medal, awarded Pan American Exposition.
1902—(12) Blue Ribbon, or highest award at the Long Island non-stop contest. (13) Blue Ribbon, or highest award at the Decoration Day run. (14) First Class Certificate in New York-Boston-New York Reliability contest, runabout model. (15) First Class Certificate in New York-Boston-New York Reliability Contest, standard model. (16) First Class Certificate in New York-Boston-New York Reliability Contest, surrey model.

All These Events Won on Timken Bearings

1903—(17) First Class Certificate in New York-Pittsburg run, touring car. (18) First Class Certificate in New York-Pittsburg run, runabout.
1904—(19) First Class Certificate in New York-St. Louis run. (20) Grand Prize at World's Fair at St. Louis.
1906—(23) In the final race, held third place on the American team.
1907—(24) Silver Cup, Automobile Dealers Association of Southern California, five-mile race for complete touring cars. (25) New York Motor Club, New York-Albany Endurance Contest, two hundred miles through mud and rain. Silver Cup for mechanical excellence and finishing first in its class. (26) Perfect score in four days Sealed Bonnet Contest, Automobile Club of America, 600 miles, with all working parts under seal; finished without a single adjustment. (27a) Perfect score in Chicago Motor Club Sealed Bonnet Contest, 176 miles, with all working parts under seal. (28b) Perfect score in Chicago Motor Club Sealed Bonnet Contest, 176 miles with all working parts under seal. (29c) Perfect score in Chicago Motor Club Sealed Bonnet Contest, 176 miles, with all working parts under seal. (30d) Perfect score in Chicago Motor Club Sealed Bonnet Contest, 176 miles, with all working parts under seal. (31) Perfect score in run from Los Angeles to Lakeside; most strenuous contest over mountain roads. (32) Perfect score in the Glidden Tour. The most difficult touring contest held in America. (33) Made fastest time of any car in its class, irrespective of price, in the Algonquin Hill Climb, Chicago Automobile Club Contest. (34) Perfect score in the New Jersey Automobile Motor Club's 24-hour endurance contest. (35) THE ONLY PERFECT SCORE IN THE CHICAGO MOTOR CLUB'S 600 mile reliability contest.

New Price List

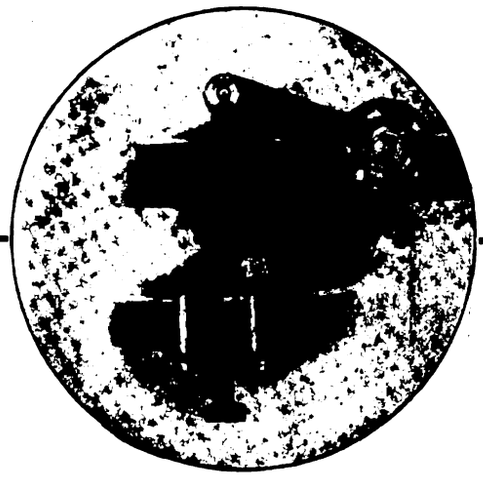
Weed Chain Tire Grips

The new price list now in effect, for Weed Chain Tire Grips follows:

American Sizes	Per Pair	American Sizes	Per Pair
28x2½	$5.00	33x4	9.50
30x2½	5.50	34x3	9.50
28x3	6.50	34x3½	9.50
28x3½	6.50	34x4	9.75
30x3	7.00	36x3	9.75
30x3½	7.00	34x4½	10.00
32x3	8.00	36x3½	10.00
30x4	8.50	36x4	10.00
30x4½	8.50	36x4½	10.50
32x3½	8.50	34x5	10.50
32x4	9.00	36x5	11.00
32x4½	9.00		

Dunlop 3, 4 and 5-inch tires require grips one size longer, as do Fisk 28x3, and all sizes of Bailey and similar treads.

CROSS CHAINS, Complete.



2½-inch	5 cents	3½-inch	8 cents	4½-inch	10 cents
3 "	7 cents	4 "	9 cents	5 "	12 cents

All Weed Cross Chains are specially hardened and Brass Plated. Insist upon getting brass plated chains.

WEED CHAIN TIRE GRIP CO. 28 Moore St. New York

Should be on your car

The Standard of the World

Not an accessory—but a proven necessity. Should be as much a part of your car as its springs or tires.

For argument's sake, suppose that Truffault-Hartford Shock Absorbers had not been an integral part of every car in every great International Road Race, Glidden Tour or Endurance Contest.

Suppose that twenty prominent manufacturers did not make the Truffault-Hartford a part of their standard equipment, then if we showed you letters from men who have used the

TRUFFAULT-HARTFORD SHOCK ABSORBER

and these men told you that broken springs were unknown, that all troubles due to vibration, jar and jolt were eliminated and that their cars ran smoothly at high speed on roads that, without Truffault-Hartford Shock Absorbers would be impossible,—if we did this,—you would equip your car, wouldn't you?

WE CAN DO THIS—we have just such letters and proofs from hundreds of satisfied owners that the Truffault-Hartford Shock Absorber does more than we claim. Then consider that twenty prominent manufacturers do make the Truffault-Hartford part of their car,—that's the best proof we know that they should be on your car.

Tell us the make, model and year of your car and let us arrange to equip it with these "life-savers." At any rate, send for our catalogue and other literature, now—today.

A Heart-to-Heart Talk About the "Maxwell"

AN ADVERTISING MAN called on us recently and told us how we should—or rather how he thought we should—advertise the Maxwell. "You Maxwell-Briscoe people"—said he—"talk too much about your factories and equipment.

"WHAT DOES THE PUBLIC CARE," he continued, "whether you have three great plants—one at Tarrytown, N. Y., another at Pawtucket, R. I., and a third, the largest of its kind, at New Castle, Ind.? The public don't care whether your factories represent an equipment of a million and a half dollars or not. Tell them about the car itself—bring up all the talking points you have." We thanked him of course, for we like to have ideas, but—we did not follow his advice.

BUT THE PUBLIC DOES CARE—for today there are two hundred and fifty-three different companies making Automobiles. How many of these will be in business a year hence? Judge by past records: In 1902 eighteen concerns went to the wall; in 1903 thirty failed; in 1904 forty died. During the past five years one hundred and fifty-five concerns have discontinued—that's why we know the public cares.

WHEN YOU BUY LIFE INSURANCE—do you pin your faith to the newcomer in the field or to that concern which, by hard work and ample experience has been able to give its patrons an **insurance that insures?** In every line some name stands prominent—Steinway on a piano—Smith & Wesson on a revolver—McCormack or Deering on a harvester are known the world over. Why? Because they are standard. So it is in Automobiles—the "Maxwell" is the Standard Car of moderate price—of established value.

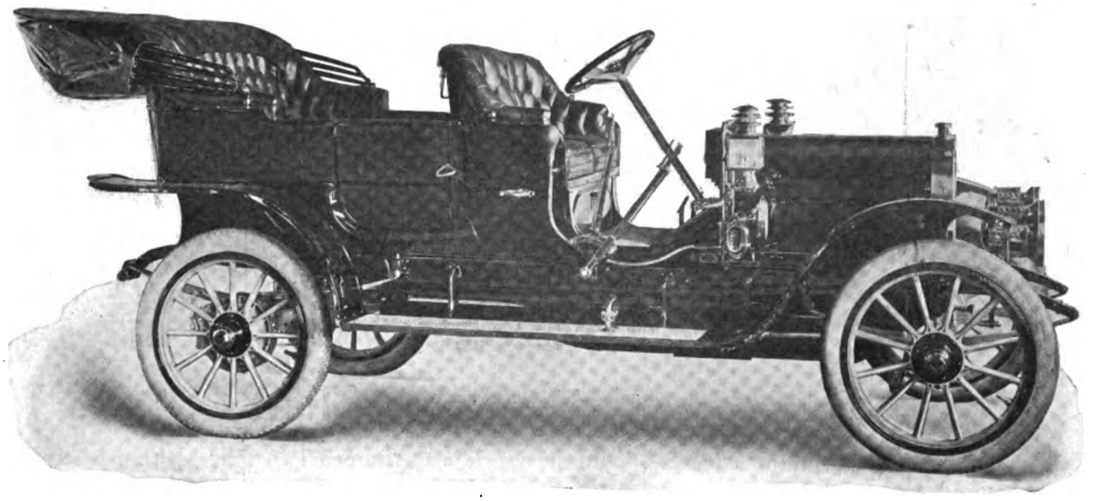
IT HAS BEEN OUR AMBITION to build the best moderate priced car; best in material, workmanship and durability. To this we have been faithful, by refusing to compete in price with every experiment.

MR. J. D. MAXWELL I consider the best designer of automobiles in the world; a man who from the beginning has been a hater of shams and a despiser of pretense—a man who has created an American car—not a copy.

NO OTHER CAR THAN THE MAXWELL incorporates in a single design the principles of **Three-Point Suspension—Multiple Disk Clutch—Thermo Syphon Cooling—Straight Line Shaft Drive—Metal Bodies**—principles that were as much a part of the "Maxwell" in 1904 as they are today.

THE MAXWELL LINE—MAGNETO EQUIPPED—is complete. The 30 H.P. 4-cylinder touring car or roadster, for those who want a speedy, powerful 4-cylinder car, costs $1,750. The 20 H.P. 2-cylinder touring car, fully equipped, the standard 2-cylinder car of America at $1,450—is the logical car at its price. The Maxwell 2-cylinder 14 H.P. runabout, the "Aristocrat of its class," costs $825, with complete equipment.

AND, LASTLY, THE MAXWELL JUNIOR AT $500. Here is a revelation—a 2-cylinder 10 H.P. Runabout—a Maxwell Runabout—for $500—one that we give our personal warrant for reliability and performance.



TWELVE THOUSAND SATISFIED OWNERS prove Maxwell success—and—remember, when you buy a Maxwell you buy a car behind which stands the Maxwell-Briscoe Motor Co., with an equipment which represents over a million and one-half dollars.

Benj. Briscoe
President.

"THE SILENT SELDEN"

$2,000 F. O. B. ROCHESTER, N. Y.

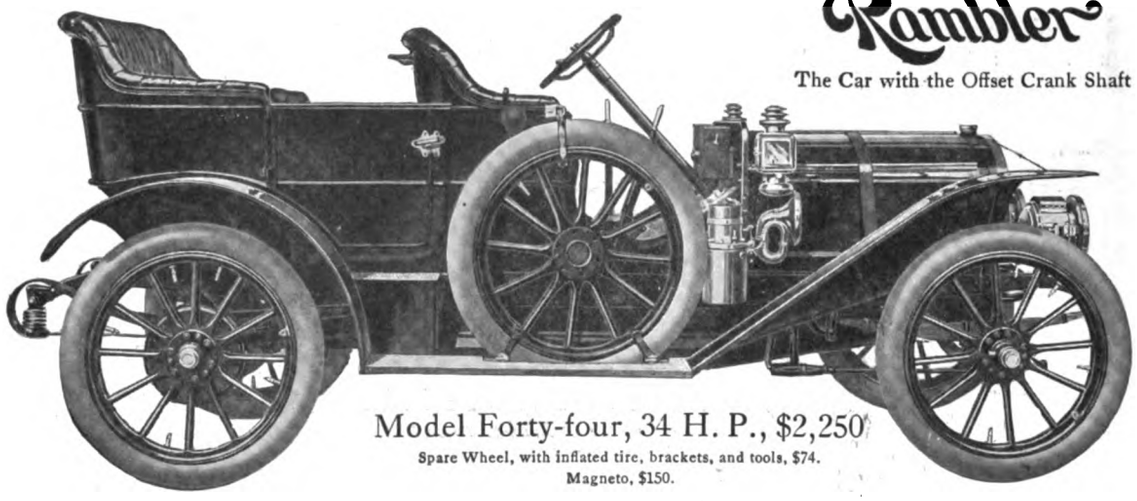
AFTER the remarkable results of our "first year"—the achieved success of 1908, we salute you with real and well established confidence as we introduce the Selden of 1909.

Not only has our promise to produce a high grade car of best materials and workmanship for $2000 been strictly fulfilled, but we have demonstrated the Selden genius in a silent, strong, comfortable, durable and handsome car. It does all that the owner wants to do and all that the chaffeur ought to do. Agents and owners are enthusiastic over it. Not a cheap car at all but one of the how-can-you-do-it-for-the-money kind.

Our 1909 wheel base is lengthened 5 inches from 109 to 114; the magneto and pump moved to left side of motor, the remaining equipment on the right; the brakes enlarged and now rigged inside the frame; the wheels now 34 inches were 32 inches; the radiator and hood made to conform in style to longer wheel base—little touches for style and convenience. No radical mechanical changes, simply because we couldn't find any necessary—no use fooling with what has proved so unusually good.

We can assure those who buy the 1909 Seldens all the efficiency of the 1908 Seldens with a little more style and a little more convenience, a little more refinement. The actual records of use and travel this year have so proven their merit, power and economic stability that it would be hard to promise anything better in practical construction.

THE COMING CAR OF MODERATE PRICE



Catalog and Agency Proposition upon Request. Agencies Wanted Everywhere.

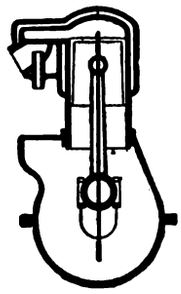
Rambler

The Car with the Offset Crank Shaft

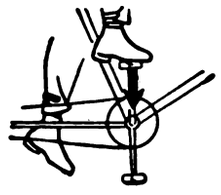
Model Forty-four, 34 H. P., $2,250

Spare Wheel, with inflated tire, brackets, and tools, $74.
Magneto, $150.



Why the Offset Crank-Shaft?

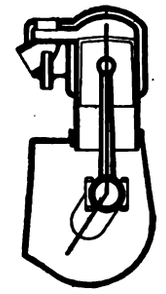
Notice a man about to mount a bicycle. He always adjusts the pedal in that position where it will receive to best advantage his full weight on the first downward stroke. This position for the pedal is just slightly forward of the center of the crank-shaft of the bicycle. If he mounted when the pedal was directly over the center of the crank-shaft, his weight would fall directly on the bearings and the first downward stroke would be retarded and therefore weak.



Now imagine the man's leg as the piston of an automobile engine, the pedal of the bicycle as the crank-pin, and the crank-shaft of the bicycle as the crank-shaft of the engine. In the ordinary engine the crank-pin and piston (the pedal and the man's leg) are directly over the dead center, and until the crank passes the turning point all effort is wasted. Thus when the explosion occurs the greatest force falls upon the bearings.

In the Rambler engine, at the instant the explosion occurs above the piston the crank-pin has moved past the dead center; the crank-shaft is in a position to receive the full pressure and turns without friction. No shock falls on the bearings; there is no side thrust, and wear on the cylinder walls is thus saved.

Because of this feature Rambler Model Forty-four can be operated smoothly and steadily at three miles an hour on high gear



Ordinary Engine. Position of piston at explosion center.

Corresponds to position of piston in ordinary engine at explosion center.

Corresponds to position of piston in Rambler engine at explosion center.

Rambler Offset Crank-Shaft. Position of piston at explosion center.

Seven-passenger model, 45 horsepower, with offset crank-shaft, $2,500. Other models $1,150 to $2,500. A new Rambler catalog has just been issued. It describes and illustrates all distinctive features of new Ramblers--the offset crank-shaft, Spare Wheel, straight-line drive, etc. A copy on request.

THE CAR OF STEADY SERVICE

Thomas B. Jeffery & Company

Main Office and Factory, Kenosha, Wis.

Branches and Distributing Agencies: Chicago, Milwaukee, New York, Cleveland, Boston, San Francisco.

The new Rambler Models will be shown and demonstrated at the Coliseum, Space B-2, and at our Chicago Branch, 1462-1464 Michigan Ave., during the Chicago Automobile Show. Telephone Calumet 3000, give your address, and we will call for you.

THE MOTOR WORLD

Volume XIX. New York, U. S. A., Thursday, February 18, 1909. No. 21

TIRE JACKET INFRINGEMENT SUIT

Specialty Company Claims Patent Rights in Fastening Device—New York Jobber Sued for Selling the Goods.

Trade complications resulting from the conflict of patent rights in the field of automobile accessories are becoming more pronounced as the industry progresses, as is again evidenced by the fact that suit has been brought against Charles E. Miller, the prominent New York jobber, exporter and importer, for alleged infringement in handling tire cases or jackets of a type which the plaintiff maintains comes within the range of its patent claims. The jackets are used for the purpose of protecting spare tires that may be carried on the car, and the particular style which forms the basis of the suit is equipped with snap buttons on the overlapping part, so that when the tire is enclosed, the final fastening of its protecting cover is at once expeditious and secure. A patent covering a construction of this kind is owned by the Allen Auto Specialty Co., of New York, the plaintiff in the action. It was applied for December 20, 1904, and was issued to Benjamin Nathan on September 19, 1905, bearing No. 799,662.

In the bill of complaint in the United States court, it is alleged that Miller is infringing the rights granted under the patent by selling jackets or covers made by the Gilbert Mfg. Co., of New Haven, Conn., and embodying the button fastener feature. An injunction is asked for, to restrain him from further traffic in the jackets, and an accounting for damages is requested. While Miller alone is the defendant, it is understood that the Gilbert company will assume the chief burden of the defense, both with a view to protecting Miller as their customer and to establish the non-infringing character of their product, as the issue of the case will be of wide trade effect owing to the fact that jobbers and dealers throughout the country are handling tire jackets of the type in question.

New Company to Make Wheels.

Encouraged by a government order for 70 sets of wheels with pneumatic hubs, the invention of G. W. Akehurst, of Baltimore, Md., a company has been formed in Newark, N. J., for their manufacture. It will be known as the No-Worry Pneumatic Wheel Co. The patents under which it will operate are owned by Dr. George S. Maxwell, of Velleville, N. J., and Dr. Zeno B. Babbitt, of Washington, D. C.

"Long-Arm" to Make Direct Sales.

The "Long-Arm" System Co., of Cleveland, O., announces that the sale of its products will hereafter be conducted direct instead of through a selling agency. The change is looked to as providing a clearer business understanding and closer engineering touch with customers. In the future correspondence relating to all matters should be addressed direct to the company.

St. Joe Adopts a New Name.

In moving from Elkhart, Ind., to Hutchinson, Kan., the St. Joe Motor Car Co., has undergone a change of name. It is now known as the Sellers Motor Car Co. Application has been filed for incorporation under Kansas laws with $100,000 capital. O. G. Sellers is slated for the presidency. A site has been taken on South Main street.

Boulder Building a Factory.

Boulder, Colo., is to boast of an automobile factory, which is being built by the American Machine & Mfg. Co. The concern will call its product the Linace car. J. H. Wallace, W. E. Whitacre and R. Lindemann are back of the enterprise.

Springfield in Another Springfield.

Preserving a town location that jibes with its name, the Springfield Automobile Co., in moving from Springfield, Mass., has selected Springfield, Ill., as its new home. The company has taken the third floor of the R. Haas Electrical Co.'s building.

REFILLING GAS TANKS MAY GO ON

Prest-O-Lite Fails to Secure Preliminary Injunction—Its Application Based on Considerations of Safety.

Conducting an extensive legal campaign with the object of maintaining a monopoly so far as possible on the compressed acetylene gas tank business, the Prest-O-Lite Co., of Indianapolis, Ind., in a suit brought against B. A. Carrier, of East Hampton, Conn., this week failed to convince the United States circuit court at Hartford, Conn., that a preliminary injunction should be granted to restrain the defendant from refilling Prest-O-Lite tanks with gas. The plaintiff has for some time been endeavoring to break up the practice on the part of others of recharging its tanks, and by litigation has succeeded in compelling those who engage in it to place conspicuous labels on such Prest-O-Lite tanks as they recharge, so that the Prest-O-Lite name will be concealed and the name of the recharging concern will be disclosed. Having won victories along this line, the company is trying to press matters still further by attempts to secure injunctions against those who refill its tanks, on the ground that the tanks when recharged elsewhere than at the Prest-O-Lite factory present a menace to human life because of their explosive possibilities.

Suit in the present instance was brought recently against both Carrier and George L. Wilkinson, who lives in Manchester, Conn., but action against Wilkinson was subsequently dropped and the attack concentrated on Carrier. Judge James P. Platt, of the Federal court, upon the showing made by the Prest-O-Lite Co., was not sufficiently convinced of the immediate dangers to the trade and the public which formed the basis of the company's request for a restraining order, and its motion for a preliminary injunction against Carrier, pending the final hearing, was denied.

WANT EXPRESS BUSINESS PROBED

New York Merchants' Association Inaugurates an Important Movement—The Complaints of Shippers Invited.

Shippers in the automobile trade, having business with the express companies, are concerned in an investigation of express company methods which the Merchants' Association of New York is petitioning the Public Service Commission of the second New York district to make. To assist the association in responding to a request for as complete a statement of facts as possible, shippers who have well-defined and reasonable grounds for complaint and can give concrete instances of practices which appear to be unjust, are urged to present them.

The investigation will relate particularly to the following points: Inequalities in charges, such as different charges over the same route in opposite directions, or different charges for equal distances, etc.; extra charges for delivery, in excess of tariff rates; delays in delivery; failure to notify shippers of non-delivery; delay in returning undelivered goods; delay in settlement of claims; disregard of specified routing; unreasonable restriction of size of packages; unreasonable requirements as to methods of packing; delay in accounting for collections; refusal to collect and return "empties," and similar practices.

Already the mass of evidence which the association has prepared to show that the express companies should change materially in their treatment of the shippers, has attained large proportions, but contributions from other complainants are welcomed, and should be addressed to the association at 66-72 Lafayette street, New York City,

In its request for the investigation, the association summarizes its case as follows:

"In view of the great increase in the volume of express traffic; the presumptive decrease ir the cost of performing the service consequent upon the increase in the volume of traffic; the failure of express companies to decrease rates in proportion to decrease in cost of operation; apparently excessive profits evidenced by liberal dividends upon greatly inflated capitalization and the accumulation of vast surplus funds; and excessive terminal charges, made on the false basis of distance instead of service—this association believes that the rates charged by express companies are unjust and unreasonable in that they return an excessive profit upon the capital actually used for the necessary purposes of the express business, bear no just relation to the cost of performing the service and impose a heavy, unjustifiable burden upon shippers.

"Having further in view the numerous and varied complaints from shippers, we believe that many of the rules, practices and methods of the several express companies should be revised in such manner as to remove just cause of complaints and adjust the relation of shippers and carriers more equitable than at present.

"We therefore respectfully pray, that pursuant to the powers conferred by Secs. 48 and 49 of the Public Service Commissions Act, your Honors will: (1) Investigate the justice and reasonableness of the rates charged by each of the express companies doing business in the State of New York, and establish schedules of charges, based upon the cost of performing the service, such charges to be so adjusted as to provide no more than a liberal profit upon the capital actually required for the efficient operation of the service, and in addition such further sums as may reasonably be set aside as a surplus for contingencies. (2) Investigate the operation of the methods, practices, rules and regulations of the express companies, in such manner as to develop such defects as may exist, and thereafter order such revision, addition, amendment or abolition as will remove just cause of complaint and establish equitable relations between carriers and shippers."

To Manage Western Lamp Sales.

Charles S. Monson has been appointed western sales manager for Gray & Davis, of Amesbury, Mass. In advancing the company's lamp sales he will bring to bear a wide trade experience, having at one time been superintendent of agencies for the Gormully & Jeffery Mfg. Co., later with the Hartford Rubber Works Co. for four years, and for the past three years manager of the Detroit branch of the G & J Tire Co.

New York to Have Biggest Garage.

What is promised to be one of the largest garage buildings in the world is to be erected on a plot in Sixty-sixth and Sixty-seventh street just west of West End avenue, New York City, by William C. Boschen, George L. Hoxie and Newell Martin. The building, which will be near the New York Central railroad tracks, will consist of four stories and a basement and will have a ground floor area of 44,000 square feet.

Birdsall Resumes Engineering Practice.

E. T. Birdsall, who recently severed his connection with the Selden Motor Vehicle Co., of Rochester, N. Y., has opened an office at 41 West Sixty-third street, New York City, where he will resume his practice as a consulting engineer and an expert in law and patent cases. He has also established a brokerage department for opinions on used cars.

Redondo's New Factory in Trouble.

Trouble has fallen upon the new automobile factory at Redondo, Cal., which was launched a few months ago. Laborers and others have made demands for their pay, and threaten liens on the property.

RAINIER'S MANY TRADE CREDITORS

What the Schedule in Bankruptcy Discloses—Total Liabilities $290,355, and Nominal Assets $283,818.

Many prominent trade creditors are shown in the schedules in bankruptcy of the Rainier Motor Car Co., New York City and Saginaw, Mich. Although the company went into the hands of a receiver last fall, and has since been bought in by John T. Rainier and his associates, subject to certain conditions, the bankruptcy schedules were not filed until last Friday, the 12th inst. They disclose liabilities amounting to $290,355 and nominal assets, $283,818, consisting of stock, $43,000; machinery and fixtures, $125,000; accounts, $114,228; delivery wagon, $1,200; cash, $220, and notes, $170. There are also unliquidated claims for damages aggregating $89,292, the actual value of which is unknown. Of the liabilities $100,000 are secured and $5,787 are for wages.

Among the creditors are the Bank of Saginaw, $90,000, secured; Briggs, Carlisle & Wickes, Saginaw, $6,000, secured; Wickes, Briggs and Comstock, Saginaw, $4,000, secured; Viola C. Rainier, $39,500, money loaned; O. B. Potter estate, $2,199; Burr & Co., $3,266; Knauth, Nachod & Kuhne, $4,500; Standard Oil Co., $1,074; Henry Hook & Co., New Haven, $11,626; Diamond Rubber Co., Akron, O., $10,514; McCord Co., Chicago, $3,899; Auto Crank Shaft Co., Detroit, $5,255; Saratoga Auto Top Co., $2,776; Gray & Davis, Amesbury, Mass., $2,961; A. O. Smith & Co., Milwaukee, $2,972; L. R. Kerr, Jersey City, $2,000; Springfield (Mass.) Metal Body Co., $13,567; Garford Motor Car Co., $1,381; Lewis M. Borden, $2,196; Wilcox Engineering Co., $1,129; Western Malleable Steel Co., Detroit, $2,380; Robert Bosch & Co., $1,301; Hayes Manufacturing Co., Detroit, $1,280; Imperial Wheel Co., Flint, Mich., $1,530; and Riverside Bank, $3,300.

Newmark to Direct Oakland Publicity.

J. H. Newmark is to have charge of the newly instituted advertising department of the Oakland Motor Car Co., of Pontiac, Mich. He was formerly with the Olds Motor Works.

United & Globe a Trenton Concern.

The United & Globe Rubber Mfg. Co.s. recently reported to be making automobile tires in Newark, N. J., are located at Trenton, N. J. All of their factories are in the latter city.

Baylies an Austin Manager.

Harry L. Baylies has been appointed Chicago manager for the Austin Automobile Co., of Grand Rapids, Mich. He will commence his new duties in the near future.

Digitized by Google

In the Retail World.

Mason A. Dingley has reopened his garage and repair shop on Maiden lane, Painesville, O.

The Melrose Automobile Co., of Melrose, Mass., has moved from Emerson street. It is now established at 364 Franklin street.

The Boston branch of the Locomobile Co. of America now is permanently located in its new quarters at 589 Boylston street.

R. K. Stout, formerly with the Toledo Motor Car Co., has opened a salesroom in Toledo, O. It is situated at 1001 Jeff avenue.

The Norris Auto Co., of Saginaw, Mich., has changed its name to the Saginaw Auto Co. Several new cars will be added to its agency list.

John Lewis has bought Whitcomb & Faulkner's repair department business at Palmer, Mass. He will conduct the garage on Main street.

The Empire Automobile Tire Co., Chicago, have leased a building at 1305 Michigan avenue, and will remodel it prior to their occupancy.

G. W. Hawkins is to be the distributor of Maxwell cars in Houston, Tex. The territory in south and east Texas will be supplied from this center.

The Ford Motor Co., of Detroit, has leased in Toledo, O., the building at 218 Superior street, and will open a salesroom for automobiles and supplies.

Robert W. Trimble and E. G. Love, of St. Paul, Minn., have opened a garage in Pine Bluff, Ark. It is located on East Court. They will handle Oakland cars.

Wallis & Culbertson Co., Dubuque, Iowa, has decided to build a large salesroom and garage. A location has been taken on Iowa street, next the Conolly carriage manufactory.

Hartford, Conn., has a new garage in an establishment just opened for the sale and care of Oakland cars. It is located at 26 Kinsley street, and A. W. Peard is the proprietor.

J. W. Leavitt & Co., San Francisco, have taken possession of their permanent quarters at Hyde street and Golden Gate avenue. Their new home is spacious and attractive.

The Guarantee Garage and Machine Co., Santa Ana, Cal., has located in a new building at Second and Brush streets. They do all sorts of automobile work and deal in supplies.

F. M. Woods, of Cedar Rapids, Iowa, having acquired the Terry Garage and the American Auto Co., both of that city, will operate them under the name of the Iowa Motor Car Co.

A. B. Haworth, formerly of the Locomobile company's Chicago branch and later with the Terre Haute Automobile Co., has begun business for himself in Terre Haute, Ind. He has leased the building opposite the Fillbeck Hotel, at the northeast corner of Fifth and Cherry streets, and will handle the Locomobile and other cars.

The Franklin Motor Car Co., representing the H. H. Franklin Mfg. Co., in Philadelphia, has secured a show room at 138 North Broad street. It is also building a garage in West Philadelphia.

A. M. Robbins, manager of the Centaur Motor Co.'s store in Chicago, Ill., has added another line to the Oakland. His establishment will be the Windy City headquarters for the Moon.

Cordner, Flinn & Toppin is the revised name of the firm in New York City which has the agency for Acme cars. C. F. Toppin, the new member, is an accession from the life insurance ranks.

Herbert Hackeler's garage at Overbrook, Pa., was burned on the 8th inst., and 14 automobiles owned by residents of Overbrook and Merion were destroyed. The loss is placed at $75,000.

The Atwood Automobile Co., Toledo, O., has leased from the Toledo Motor Car Co., its building on Madison avenue, between Tenth and Eleventh streets. The lessees will use it for a downtown branch.

B. A. Bone has sold his automobile business at Commercial and Park streets, Kewanee, Ill., to O. B. Olson. The latter will conduct a light pump manufacturing enterprise in connection with the garage.

The Wheeling Auto Co., of Wheeling, W. Va., has been organized by B. F. Perkins and Allison Dick. A commodious garage and salesroom has been opened in the Perkins building at 2321-27 Main street.

The Consolidated Motor Car Co., Franklin dealer in San Francisco, has established a branch at Oakland, with Tracy Holmes as manager. The branch is at the corner of Telegraph avenue and Twenty-second street.

The Otis Motor Car Co., South Bend, Ind., has started the construction of a new garage and Franklin sales room in the heart of the business district, near the Oliver Hotel. Its floor dimensions are 20 by 80 feet.

Firestone tires will be handled in Cleveland, O., by a direct branch of the company after the first of March. The company has leased the entire basement at 1918-1922 Euclid avenue, and is remodeling the premises.

The Iowa Motor Car Co., of Cedar Falls, Iowa, has purchased the business and equipment of the American Auto Co. and will occupy the garage at Second street and Fourth avenue. F. M. Woods will be the manager.

August J. Mandell, Arthur Zeller and C. Zeller have organized the Economy Auto Garage Co., in Detroit, Mich., and have opened up for business at 10 Selden avenue. They will make the repair and storage of automobiles their principal business, and will deal in second hand machines.

The Atlantic Automobile Co., Council Bluffs, Iowa, has filed articles of incorporation and has completed plans for a garage. The latter will be on Fourth street, directly opposite that recently erected by H. H. Van Brunt.

The Lubeck Automobile Co. of Grand Rapids, Mich., has been placed in the hands of David E. Warner as receiver, preparatory to the concern retiring from business. It is stated that the liabilities are fully covered by the assets.

Hall Brothers, of Manitowoc, Wis., were visited by fire on the night of February 5. The blaze destroyed their garage and warehouse and burned several machines. The loss was estimated at $10,000 with about $4,500 insurance.

Osmond L. Barringer, of Charlotte, N. C., has planned to build a garage on Eighth street, 50x180 feet in ground dimensions and one story high. A show room will occupy the front and a fully equipped repair shop will be in the rear portion.

The Cadillac Automobile Co., of Indianapolis, Ind., suffered a fire loss on the 1st inst., estimated at $18,000. The garage at 25 East Ohio street was badly burned and 13 cars were damaged. All the losses are thought to be covered by insurance.

The B. D. Whitten Automobile Co., recently organized in Great Falls, Mont., has taken over the machinery, fixtures and business of the Evans Engineering Co., and will conduct a garage and repair shop. B. D. Whitten will be the superintendent.

Two university boys have opened a garage in Eugene, Ore., where the University of Oregon is located. They are Roy Zacharius and Fred Moullen. The latter has considerable automobile experience, having spent several summers working in large garages.

Herbert MacKellar's garage, 2099 North Sixty-third street, Philadelphia, Pa., was swept by fire on the 8th inst., resulting in a loss amounting to about $75,000, including the cars of private owners. Only a small portion of the loss was covered by insurance.

W. R. Reid and W. E. Ludwick are about to open a garage in Moline, Ill., under the firm name of Reid & Ludwick. The establishment will be at 404 Sixteenth street. Ludwick has been foreman in the Root & Vandervoort garage in East Moline for eight years.

The Solliday Motor Car Co., of Milwaukee, Wis., has been sold to George L. Stephenson, A. E. Halderman and George A. Davis and will hereafter be known as the Stephenson Motor Car Co. The concern will handle the Overland, Speedwell and Welch cars.

The New York City office of the Hess-Bright Mfg. Co., Philadelphia, Pa., has been removed from 90 West street to 1974 Broadway, above Sixty-sixth street, where a store has been opened with a complete line of the

Digitized by Google

company's products. George T. Gwilliam is the resident manager.

The Binghamton Auto Repair Co., Binghamton, N. Y., has been adjudged bankrupt by U. S. Judge Ray, of Norwich. The company is a co-partnership composed of Ralph Ives, Lynn D. Robinson and Fay E. Spawn

V. A. Simrell and A. J. Schnell have begun business in Scranton, Pa., as the Court House Square Garage. They have located at 527-531 Linden street, where they will handle Studebaker and E-M-F. cars. Repairing will be a branch of their business and they will carry accessories.

W. A. Fox, representing the Cartercar in Minneapolis, Minn., has moved from 249 Third avenue, S., to Ninth street and Hennepin avenue. His new space is in connection with the Minnesota Motor Sales Co., and the name of his company will hereafter be the Fox Motor Car Co.

The Martin Auto Co., a new concern in Newark, N. J., has opened the De Kamp garage, 284 Halsey street, after making extensive alterations and improvements. F. L. C. Martin, State distributor of Mitchell cars, heads the company, and A. A. Russell, secretary and treasurer, is manager.

The Guy L. Smith Automobile Co., 310-312 South Nineteenth street, Omaha, Neb., is about to begin the construction of a new fireproof building near Twentieth and Farnam streets. It will be larger than their present quarters and is to be a handsome structure with all the latest conveniences.

The property of the Continental Automobile Co., 93-99 Jefferson avenue, Grand Rapids, Mich., was seized on the 28th ult., on three attachments. The attachments are subject to a chattel mortgage held by a creditor not party to the proceedings, and amounting to $1,500. The inventory of the property totals about $3,600.

The Lozier Motor Co. will move within a few days from its present quarters at Fifty-fifth street and Broadway, New York City, to the five story building at Broadway and Fifty-sixth street, where it will have about double the room now occupied. The building has a large frontage on both thoroughfares and is thoroughly equipped.

The Levy & Hipple Motor Co., Chicago, has moved from Wabash avenue to its new building, 1467-69 Michigan ave. The building affords 20,412 feet of floor space on three floors, and a mezzanine floor which forms a gallery to the main floor. With its glass and white tile front the establishment is one of the most impressive on automobile row.

Rockford, Ill., has a new garage at Sixth and Charles streets, just completed for the Standard Auto Co. It is a one story building, 100x40 feet, constructed of concrete blocks. The equipment is up to date. The company has applied for incorporation. Dr. Emil Lofgren, Dr. G. Laon, Dr. W. E. Park, John Wester and Swan O. Widell are the proprietors. Leonard Lundstrom is manager.

The Week's Incorporations.

Detroit, Mich.—Economy Auto Garage Co., under Michigan laws, with $1,000 capital.

Chicago, Ill.—Reo Automobile Co., under Illinois laws, with $2,500 capital. Corporators—O. C. Owen, B. C. Buxton and William R. Watson.

Denver, Colo.—Griebel Motor Car Co., under Colorado laws, with $20,000 capital. Corporators—Henry R. Griebel, Blanche Griebel and A. Lloyd Wilkins.

Jersey City, N. J.—Automobile Co. of America, under New Jersey laws, with $500,000 capital. Corporators—A. C. Watson, B. Lockwood, Jr., and R. F. Tully.

Muskegon, Mich.—Muskegon Motor Specialties Co., under Michigan laws, with $20,000 capital. Corporators—C. L. Chamberlain, C. E. Johnson and J. W. Wilson.

Chicago, Ill.—Overland Motor Co., under Illinois laws, with $1,000 capital; to deal in automobiles. Corporators—W. J. Bowman, C. W. Price and Nathan S. Swyser.

Jersey City, N. J.—National Motor Cab Co., under New Jersey laws, with $2,000 capital. Corporators—The Corporation Trust Co., H. O. Coughlin, B. S. Mantz and Arthur W. Britten.

Chicago, Ill.—W. O. Dayton Automobile Co., The, under Illinois laws, with $10,000 capital; to manufacture and deal in motor cars. Corporators—W. O. Dayton, T. A. Ryan and O. F. Cole.

Providence, R. I.—Greenleaf Automobile Co., The, under Rhode Island laws, with $50,000 capital; to deal in cars. Corporators—Clarence Kinne, Grafton G. Greenleaf and Ira J. Martin.

Philadelphia and New York City—Stoyle-Vogel Co., The, under New Jersey laws, with $100,000 capital; to deal in automobiles. Corporators—Wilson H. Stoyle, Lewis G. Vogel and Frank A. Kuntz.

Vernon, N. J.—Vernon Motor Co., under New Jersey laws, with $25,000 capital; to deal in motor vehicles. Corporators—William H. Carey, Charles J. Gormley and John H. Patterson, of Jersey City.

New Rochelle, N. Y.—New Rochelle Motor Car Co., The, under New York laws, with $10,000 capital; to deal in cars and accessories. Corporators—Robert A. Joyce, Grace M. Joyce and Frederick W. Ott.

Boulder, Colo.—American Machine & Manufacturing Co., The, under Colorado laws, with $100,000 capital; to manufacture the Linace motor car. Corporators—J. H. Wallace, W. E. Whitacre and R. Lindemann.

Indianapolis, Ind.—Indianapolis Motor Speedway Co., under Indiana laws, with $250,000 capital. Corporators—Carl G. Fisher, president; James A. Allison, secretary; A. C. Newby, vice-president; F. H. Wheeler, second-vice-president.

New York City, N. Y.—Stewart Automobile Co., The, under New York laws, with $50,000 capital; to instruct in the use of automobiles and other vehicles. Corporators—A. V. Lyall, F. S. Ferguson, Jr., and W. H. Stewart, Jr.

New York City—Scientific Research Co., under New York laws, with $100,000 capital; to manufacture automobiles, motor boats, manufacturing machinery, etc. Corporators—A. Elliott Ranney, Arthur M. Day, Andrew J. Robinson, all of No. 1851 Broadway, New York.

Richmond, N. Y.—North Shore Garage, under New York laws, with $1,500 capital; to manufacture, repair and lease cars, carriages, wagons and boats. Corporators—Philip J. Freund, Tompkinsville, N. Y.; Henry M. Schloss, West New Brighton, N. Y.; Henry Decker, Broadway and 23d street, New York City, N. Y.

New York City, N. Y.—Marathon Automobile & Garage Co., under New York laws, with $1,000 capital; garage and storage business. Corporators—Robert G. Beville, 133 West Sixty-ninth street; Walter C. Wyckoff, 71 East Eighty-seventh street; Philip M. S. Chedbrum, 317 West 134th street; Hugh H. Harmer, 1 Madison avenue, New York City, N Y.

New Haven, Conn.—Consolidated Rubber Co., of New Haven, under Connecticut laws, with authorized capital of $250,000, to commence business with $5,000; deal in rubber and rubber products, or the stocks or property of similar companies. Corporators—W. B. McCarthy, Josephine L. McCarthy, Milford, Conn.; Margaret M. Hogan, New Haven, Conn.

Trade Carnival Opens on April 5.

New York City automobile dealers plan to repeat the spring trade "carnival" which last year served to stir up public interest in their offerings. The week of April 5 has been selected as the time for the "doings," and in addition to having "Automobile row" gayly decorated, the large automobile parade will again be made a feature. The arrangements are in the hands of the committee that was re-elected at the close of last year's event and of which General John T. Cutting is the head.

Reeves and Lazarnick After Tarpon.

Alfred Reeves, general manager of the American Motor Car Manufacturers Association, and Nathan Lazarnick, trade photographer, leave for Florida today, 18th inst., for three weeks of tarpon fishing and recuperation from showtime worries. They will go to Long Key, about 90 miles south of Miami, where D. J. Post will join them.

Hartford to Have More Cabs.

Taximeter cab business in Hartford, Conn,. has been so good with the single machine installed by the R. D. & C. O. Britton Co. that four more machines have been ordered. They will be put into service immediately and further additions to the equipment are probable.

ANOTHER PATENT WAR IN SIGHT

Daimler Interests Aim to Draw Tribute from British Makers—Claims Based on Great Group of Patents.

After a period of quiescence on the subject, the Daimler interests in England have again commenced agitation on the subject of enforcing their alleged rights as holders of controlling patents on a number of different devices widely employed in motor car construction. Some little time ago the principle of the gate change for selectively operated transmission systems was claimed to be covered by patents issued to the Daimler Co., but little or nothing was done in the way of obtaining final judgment in the matter. Last December, however, the matter was taken up again and a number of firms notified that the holding company was prepared to issue licenses on this or any other of a large number of patents held to be of equal validity. The Society of Motor Manufacturers and Traders has been called into the case, and it seems likely that a more or less vigorous patent war will be waging within a short time.

The main issue is in the matter of the gate change patent, though other patents covering the original Daimler and Mercedes constructions are in question to the number of 37 in all, many of them applying only to the English Daimler car. All of these are British patents, owned by the Daimler-Mercedes Motor Co., Ltd. Some idea of the breadth and scope of the group and of the audacity of the attempt to levy tribute upon them from infringing manufacturers, may be obtained from a brief review of their specifications as published in abridged form by the Autocar. The numbers and subjects of the patents are given in each case as follows:

No. 10,257 of 1898—This is the first "honeycomb" radiator patent. In this case the cooler is made of round tubes, after the manner of a fire tube boiler.

No. 7,270 of 1899—Splayed driving wheels obtained by the use of a countershaft bevel-driven from the driving shaft. The splaying is obtained by using two sets of bevel driving gears, one for each half of the countershaft, and mounting the differential gear upon the driving shaft.

No. 7,271 of 1899—A water-cooled brake, in which the water tap is turned on when the brake is applied, and turned off when the brake is withdrawn.

No. 9,805 of 1899—This is the original gate change patent. The invention consists in the use of two sliding gear wheel sleeves, each having its own operating rod, the two rods being brought side by side, and adapted to be connected up to a single speed lever working backwards and forwards in two slots connected together by a "gate."

No. 21,652 of 1900—Locking mechanism for gate change gear sleeves. The selecting quadrant carried by the change speed lever actuates a locking bolt having one slot in it for the passage of only one selecting rod at a time.

No. 3,023 of 1901—An expanding brake having a pair of shoes anchored to the frame by a link, and separated by a toggle mechanism actuated by a crank.

No. 3,235 of 1901—A honeycomb radiator is built up of a number of rectangular tubes separated by wires, which cause spaces to be left between the tubes for the water circulation.

No. 6,976 of 1902—A cooling system in which the bonnet is made without louvres and enclosed underneath, the fly wheel being formed with fan vanes, so that the air is drawn through the radiator and discharged underneath the car.

No. 28,259 of 1902—This relates to the tubes of honeycomb radiators which are constructed with enlarged ends so that the ends fit together, leaving intermediate water spaces.

No. 3,571 of 1904—A combined steam and petrol engine, in which the exhaust gases heat the jacket water, which in course of time generates steam used in a steam engine cylinder.

No. 3,572 of 1904—A cooling system which is completely closed, the water being arranged to boil in the jacket and be condensed in the radiator, the return from the radiator to the jacket being effected by a pump.

No. 3,573 of 1904—The same construction is employed as is used in the previous patent, No. 3,572 of 1904. The invention consists in using a liquid having a lower boiling point than water, such as alcohol.

No. 4,956 of 1904—A compound engine in which the high pressure cylinders are provided with a combined inlet and exhaust valve, the exhaust passages being extremely short, so that the heat lost in passing through them into the low pressure cylinder is reduced to a minimum.

No. 23,990 of 1904—To facilitate starting the engine, the engagement of the starting handle with the engine shaft forces along the cam shaft to bring about half compression in the usual manner. A large number of different constructions are described and illustrated.

No. 22,947 of 1905—A pneumatic transmission system having the air compressor arranged between the cylinders, the air passing into a heater kept hot by the exhaust gases, and thence supplied to two driving motors. The feature of the invention consists in coupling the inlet and exhaust valves of the compressor together in a certain manner.

No. 6,685 of 1906—An automatic carburetter. Over the jet nozzle is arranged a pendant cam device. This cam device turns about its pivot under the influence of the engine suction, affording a larger or smaller passage of air past the jet according as the engine speed increases or decreases.

No. 7,337 of 1906—A reversing gear of the bevel type for boats.

No. 25,051 of 1906—To reduce the length of the engine, the governor and its casing is placed between the cylinders. It otherwise operates in the usual manner.

No. 25,067 of 1906—Front driving wheels, the wheels being driven through bevel gearing with an intermediate shaft on the steering center.

No. 25,076 of 1906—A system for enabling the driving wheels to be splayed when internal gearing is used. The pinion and internal gear are provided with helical teeth.

No. 25,081 of 1906—For starting engines, compressed air is kept in a tank and passed through a carburetting device into the engine. A dynamo, rotated by hand, supplies current through a contact breaker to the cylinders.

No. 25,103 of 1906—This relates to the mounting of the spring platform and the radius rod so that the spring platform takes a suitable bearing on the axle.

No. 1,696 of 1907—This carburetter is formed with a movable sleeve, by which the amount of air passing the jet can be cut down, and that passing round the jet can be simultaneously increased, or vice versa.

No. 1,696A of 1907—This refers to a carburetter having a vertical moving sleeve operated by rack and pinion mechanism, the sleeve being formed as a choke tube, and having air passages in it.

No. 2,360 of 1907—A flexible coupling between the engine and the gear box taking the form of an intermediate shaft, with specially shaped ends allowing universal movement.

No. 3,514 of 1907—Automatic device for advancing and retarding the ignition according to variation of engine speed. A governor slides along an angularly slotted arm, which is engaged by a pin projecting from a shaft. This shaft is rotated so as to advance or retard the ignition as the governor sleeve moves along.

No. 5,104 of 1907—Transmission gearing for cars, in which all four wheels are driven. The power is taken from the gear box by means of a lower shaft, which projects forwards under the fly wheel and engine to the front axle, and backwards to the back axle.

No. 6,202 of 1907—The differential gear is mounted upon the end of the propeller shaft, which is universally jointed to the main propeller shaft, the tail end being at an angle to the axis of the car. Each half of the driving axle has its own bevel transmission, and thus dished driving wheels can be used.

No. 6,346 of 1907—An expanding brake in which one end is pivoted to the fulcrum of the operating lever, the other end being connected to the operating lever by an adjustable spindle.

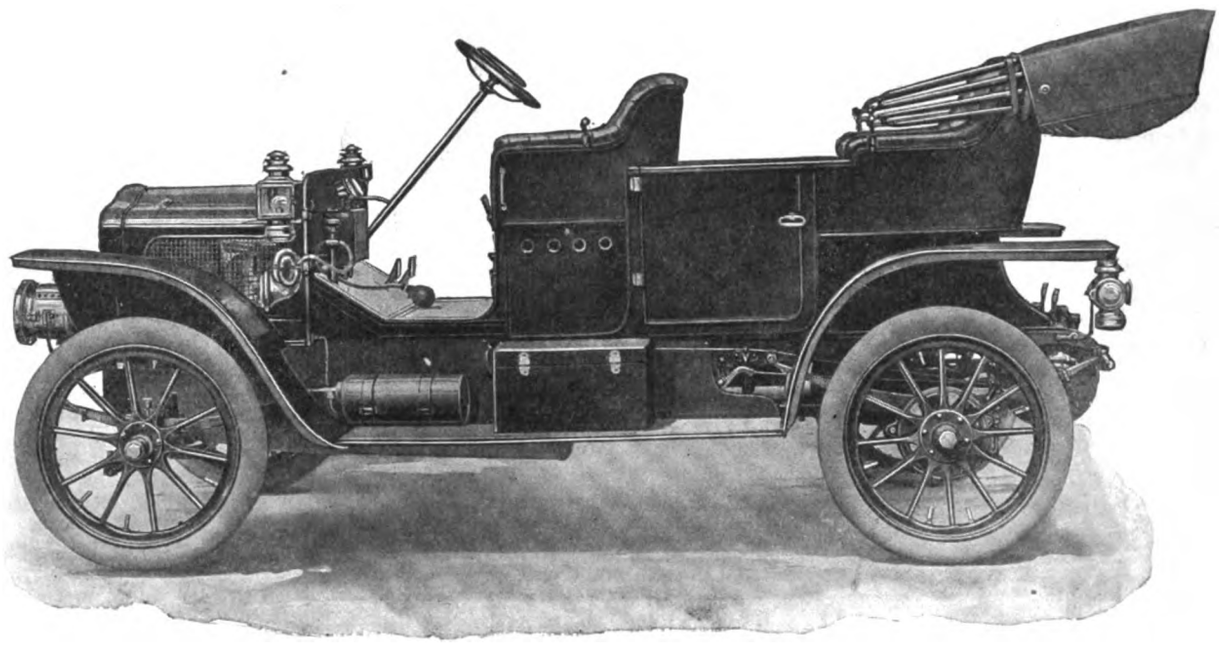
No. 7,028 of 1907—This is a shock absorber comprising a pair of frictional surfaces carrying face cams, which in their normal position are separated. When big relative movement takes place, the cam surfaces fit between the surfaces owing to the spring.

No. 10,263 of 1907—To reduce the overall length of crank shafts without impairing their strength, the webs are made of eccentric discs.

No. 11,407 of 1907—A duplicated clutch in which the surfaces are split conical rings, which spring outwards and engage under their own pressure before that of the main clutch spring comes into effect.

No. 11,407A of 1907—This clutch comprises a spring-controlled wedge-like ring which engages a cone on the driving member and a split ring interposed between the wedge and a drum on the driving member, respectively.

No. 14,850 of 1907—A differential gear is constructed like an epicyclic gear with an internally toothed ring, two sets of planet pinions being used, these being carried by the driving member, one of each set engaging the internal ring and the other the sun pinion.



No. 14,851 of 1907—A brake for heavy vehicle wheels when internal gearing is used. The rim is extended and formed with a V groove engaged by V slipper blocks.

No. 19,269 of 1907—This invention consists in water cooling the crank chamber and gear box, so as to keep the oil at a low temperature. The parts are water jacketed and in the ordinary circulation.

No. 20,298 of 1907—A forced feed lubricating system, comprising a number of pumps, a common distributing valve, and a casing with ports in it, the valve being composed of two rotatable parts connected together by a spring.

THE ADVANTAGES OF THE
WHITE STEAM CAR

The White Steamer possesses so many points of superiority over other types of automobiles that anyone who purchases a car without first investigating the White is acting with only a partial understanding of the present-day attainments in the construction of automobiles. The principal advantages of the White may be summarized as follows:

All variations of speed are obtained without the shifting of gears.
The speed of the car responds instantly to the throttle.
It is free from vibration.
It is noiseless.
It is smokeless and odorless.
The engine can never be "stalled."
It starts from the seat—no "cranking."
It is easiest on tires.
The power is transmitted without the use of a friction clutch.
It is unequalled for hill climbing.
It is the simplest car to operate.
It is the safest for the passengers as well as for other users of the highway.

We can meet the requirements of almost every pocket-book with either our 20 horse-power car at $2000 (shown above), or our 40 horse-power car at $4000.

Entered as second-class matter at the New York Post Office, November, 1900.

NEW YORK, FEBRUARY 18, 1909.

The Government of the Sport.

The American Automobile Association has found it necessary to announce that it still issues sanctions and governs racing, despite the fact that it has "nothing more to do with racing on horse tracks."

But as most races are run on such tracks and since they no longer come within the scope of the A. A. A., if the wise Mr. Hower will kindly submit a diagram showing just how the A. A. A. governs the whole sport while remaining blind to a large part of it, it may become possible to discover whether the organization is standing on its head or on its heels.

If the wise gentleman will make public also the long list of the clubs and other promoters that have conducted events of whatever sort without A. A. A. sanction and will name, say, even a dozen men who have been disciplined for competing in such unsanctioned contests, the extent and true character of its government will be made clearer. For its sins of omission have been many, indeed.

The A. A. A.'s control of sport always has been more amusing than consistent, and since the organization decided to have nothing more to do with track racing its government has become almost a real farce. For, as anyone can do anything on the track without either sanction or supervision, and without fear of punishment and yet be free to compete in sanctioned contests, the farce cannot well be carried to much greater lengths. If the A. A. A. believes that track racing is dangerous and a detriment to the whole sport, its plain duty is not to close its eyes to it nor to shirk responsibility, but to crush it by forbidding it and by punishing all who may engage in it; it cannot be improved or made safer by being permitted to run wild, so to speak.

What the A. A. A. long has needed in its government of sport is a man who does not fear to do his whole duty by enforcing the rules—and all of them—exactly as they are laid down and without resort to the apparently fixed policy of first stopping to consider whether the enforcement will offend or antagonize any club or any man of influence in the trade or outside of it. In no other way is it possible to give a square deal to all and to merit unstinted respect and support.

The A. A. A. is the logical and proper body to control the whole sport of automobiling, and had it controlled it manfashion, in strict accordance with its rules, there would be neither need nor room for a Manufacturers' Contest Association or anything else of the sort. The existence of that association is a reflection on the A. A. A. manner of government.

The Function of the Catalog.

In connection with the implied criticism of current methods of cataloging motor cars, which is given in another column, some little stress is laid upon the fact that almost without exception manufacturers are in the habit of failing to discriminate between current models and those which have preceded them, except where entirely new machines are built, or where the most striking differences in practice exist. All of which leads to the observation that it has been the policy of a large number of manufacturers to follow out in the advertising the principle that their product is a standard one, practically in all respects, and that whatever alterations are made in it from time to time are of a purely minor nature—hardly worthy of more than passing comment, in fact. Further, it must be granted that the wisdom of such a policy has been proved in many instances.

Still it is questionable whether the same ends might not have been served had it been the custom to indicate in every case just what changes had been made from year to year or season to season so that those who were thoroughly familiar with the car—particularly with its shortcomings—might be made to appreciate the advantages of the new models as compared with the old.

In the last analysis, it may be considered a question of whether the catalog is intended to appeal most strongly to the prospective purchaser who is of the class assumed to be entirely ignorant of the general construction of any particular car, or to the enormous and preponderating class of those who are pretty well posted on the construction of all the better known cars on the market, who are able to grasp the more important structural details of the vehicle from specifications and detailed illustrations, and who peruse such catalog as they may be able to lay hold of more in an effort to discover how the various machines differ from one another and what of novelty they contain, than with the idea of making a close study of their absolute characteristics.

This they reserve for an actual inspection of the machine, in most instances, it should be observed, while to the catalog must be left the difficult function of re- should be observed, while to the catalog for comparative purposes, and of displaying eye-catching details of one sort or another. Certainly wherever these elements may be subserved by the introduction of the elements of newness or difference from other machines, the impression of the more stable features of the machine is most likely to be impressed upon the mind.

Actual sales due to catalog work alone probably are very rare. Indeed all trade literature, in this, as in other lines of merchandising, is to be regarded in the aspect of a selling help rather than as a direct medium of sales business. On this account the catalog must be made as able and instructive an assistant to the selling force as possible, and further, it must be molded along lines which shall make it most acceptible to the reader and most easily and quickly digested. All this being so, it is

Digitized by Google

difficult to find reasonable objection to the practice of recording in cojent and definite form not simply the individual characteristics of the machine as contrasted with others of its own or other classes, but, also its points of difference from other machines which have been its immediate predecessors.

Developing Formulas of Design.

It has taken a pretty long time—relatively speaking—for the motor vehicle designer to learn even vaguely the relationships existing between the various conditions which are laid down preliminary to the design of a car, and further, to learn to develop them in mutual harmony. Ultimately it may come about that, given one or two variables in the specifications of a machine, the apt and up-to-date draughtsman will be able to define exactly the other specifications of the car, and so to lay down its design without more adoo. Up to this time, however, there has been a vast deal of uncertainty in the average factory engineer's office, while even yet there is more of cut and try in the construction of a new model than is pleasing.

One point, as showing how questions of design are gradually and certainly converging toward an ultimate corelationship which shall be understood by those skilled in the craft, came to notice recently when an engineer whose work reveals thorough comprehension of the conditions involved in automobile service ventured a rather novel opinion in the matter of cooling.

"The cooling problem may be considered practically as a function of the ratio of weight to power," he observed. "That is to say, it is comparatively easy to keep an engine down to a reasonable working temperature if it is well below full load when working under average conditions, while similarly an engine which is constantly laboring, requires a greater proportionate cooling effect in order to keep it from overheating. And this principle holds good practically without regard to the speed of the vehicle."

Indeed, it may be said that the proportion between the output of the motor and the total weight on wheels is of far greater importance than generally has been appreciated up to this time, and that upon close and analytical investigation it may be brought into definite relationship with a number of other considerations which usually have been treated more or less independently. Due perhaps in large measure to the popular desire to have ample power for hill climbing, not at hill climbing speeds, but at ordinary road speeds; and for high speed work, the power of the average touring car has been raised gradually during the past two or three years until in many instances it has come to be beyond all reasonable relation to actual requirement. It has been demonstrated in this connection, however, that machines which are overpowered in this way are far more durable, take it all in all, than those which are figured more closely in the matter of power, and also that they are at once more flexible and silent in action—as naturally would be expected.

As practically every element in the machine is in some way contingent upon either the weight carried or existing in the vehicle itself or upon the power developed or transmitted by its mechanism, the importance of firmly establishing a proper proportion between these two basic factors is plain to see. How from it, other and subordinate elements may be developed according to a scale of purely dependent quantities, thus establishing a system of complete standardization in the dimensional rather than the qualitative sense, may be inferred from further consideration of the above quoted hypothesis, which serves as an apt illustration.

The Motor re-Print is still up to its old tricks. In a single issue of the house organ of a western manufacturer there is reproduced thirteen different items taken from that publication and of the thirteen, ten originally were stolen bodily from the Motor World by the re-Print. Fortunately or unfortunately, however, they were not of sufficient length for that grand larcenist of automobile journalism to employ its usual fraud of attaching to the items the names of mythical engineers or other persons who exist only in its peculiar imagination.

Unless it is what is vulgarly termed a publicity stunt—an opinion held in some quarters—the real friends of the manufacturer who is suing for the return of his fee paid for the entry of a car in the Vanderbilt cup race should take him aside and whisper in his ear a few words of unbiased advice. If it brings a man's sportsmanship into public question or seems to place him in the attitude of a hard loser, even a spectacular or legal "publicity stunt" at whatever price, is of doubtful value and serves doubtful purposes.

COMING EVENTS

February 15-20, St. Louis, Mo.—Automobile Manufacturers and Dealers Association's annual show.

February 15-20, Bangor, Me.—Eastern Maine automobile show, Auditorium.

February 16-18, Denver, Co.—Denver Motor Club's first annual show, Auditorium.

February 17-20, San Jose, Cal.—Automobile show, Auditorium Rink.

February 20, 21, 22, New Orleans, La.—New Orleans Automobile Club's Mardi Gras carnival 3 days race meet.

February 20-27, Newark, N. J.—New Jersey Automobile Trade Association's show.

February 20-27, Hartford, Conn.—Automobile Dealers Association's show.

February 22, Los Angeles, Cal.—Automobile Dealers Association of Southern California's annual hill climb on Altadena hill.

February 22, Omaha, Neb.—Omaha and Council Bluffs dealers' show, Auditorium.

February 22, Cleveland, O.—Cleveland Automobile Dealers Company's show, Central Armory.

February 22-27, Portland, Me.—Automobile show.

February 24-27, Baltimore, Md.—Automobile Club of Maryland's show, Fifth Regiment Armory.

March 1-6, Buffalo, N. Y.—Buffalo Automobile Club's 7th annual show, Convention Hall.

March 1-6, Providence, R. I.—Automobile show.

March 2-6, Rochester, N. Y.—Automobile and Motor Trades Association of Rochester show, Convention Hall.

March 6-13, Boston, Mass.—Boston Automobile Dealers Association (Inc.) seventh annual show, Mechanics Building.

March 8-13, Kansas City, Mo.—Kansas City Automobile Dealers Association's show, Convention Hall.

March 8-13, Portland, Ore.—Portland Automobile Club's show.

March 10-13, Memphis, Tenn.—Automobile show, Auditorium building.

March 13-20, Minneapolis, Minn.—Minneapolis Automobile Show Association's show, National Guard Armory.

March 15-20, Rochester, N. Y.—Rochester Automobile Dealers Association's show, Convention Hall.

March 16, 17, 18, Chattanooga, Tenn.—Three days race meet and hill climb on Lookout mountain.

March 27-April 3, Pittsburg, Pa.—Automobile Dealers Association's show, Duquesne Garden.

April 15-17, Louisville, Ky.—Louisville Automobile Association's show, Coliseum.

GARDEN SCENE AT DETROIT SHOW

Many Cars Staged Amid Venetian Landscape and Singing Birds—Display of Accessories a Big Feature.

Three hundred little canary birds singing in their gilded cages are the clamorous element of decorative setting for the second annual show of the "DADA," which is holding the boards at the Wayne Casino at Detroit this week. After seven years of experience under various conditions from those of a side attraction at a sportsman's show to the full fledged motor shows of the past five years, the Detroit Automobile Dealers Association, otherwise passing under the cryptic which rhymes with Papa, have learned how such an affair should be managed. Last year for the first time, the experiment of an automobile show under an automobile management was successfully tried out at Riverside Park. Efforts at outdoing all previous records have resulted this year in what is fondly termed by manager E. Le Roy Pelletier, "the picture show of the country."

For the decorative arrangement of the lower floor of the Casino the semblance of a Venetian garden has been chosen. The walls are lined with huge paintings representing various sorts of automobile lore, while the booths are marked off with lattices, each exhibit being distinguished by a stained glass sign. From the latticed ceiling great quantities of smilax are hung, while concealed among the leaves are the 300 little birdies in their cages, ready to be counted. The second floor is laid out according to a scheme of staff work, centering about a massive fountain in the middle of the floor, which introduces an allegorical novelty, so to speak, in the shape of "chauffeur-mermen," four of whom support the font of the piece. A touch of beauty is added to the decorative treatment of the bowl itself by the presence of a row of "racing faces," while various automobile scenes are empanelled about the base of the structure. The total height of the affair is some 30 feet, and the diameter of the bowl is of practically the same measurement. Staff columns serve to mark off the spaces between the booths, while strings of electric lights are festooned about them and to and from the roof.

In the placing of the show, Detroit has taken advantage of the recent closing of the Chicago show, two express train loads of cars having been required to transfer the exhibits which were to do second duty after the shutting down of the Coliseum last Saturday night. A rough count of the cars on view shows them to number somewhere about 200, while the accessory exhibits are of more than usual interest because of the manufacturing strength of the locality. This factor, it should be observed, serves to make this one of the most important, if not the most important of the local shows. Michigan is said to be responsible for no less than 59 per cent. of the automobile output of the world, and though the estimate is liberal, to say the least, there is no question of the importance of the state as a center of automobile manufacture. Detroit's proportion of this output is of great significance as between 40,000 and 50,000 operatives are employed in producing it. On this account quite as much as because of the representative nature of the exhibits, the show is of considerable significance. The doors of the Casino were opened on Monday last, 15th inst., and the show will remain open during the remainder of the present week.

Newark Show Ready for Opening.

Preparations for the opening of Newark's second automobile show in the Essex Troop armory on Saturday evening of this week, 20th inst., are rapidly nearing completion. A glance at the list of exhibitors shows that the exhibition will be a more nearly representative one than the average of its class. Some thirty different makes of car will be on view, including the Acme, Brush, Cadillac, Chalmers-Detroit, Ford, E-M-F. "30," Jackson, Kisselkar, Locomobile, Marmon, Maxwell, Mitchell, National, Oldsmobile, Overland, Pennsylvania, Pierce-Arrow, Peerless, Premier, Rambler, Regal, Reo, Stevens-Duryea, Stoddard-Dayton and White.

About 75 or 80 cars will be on view during the week, in addition to the full line of accessory exhibits. An elaborate program has been arranged for the week, including music every afternoon and evening, and a moving picture exhibition every night. The show will be opened by George E. Reeve, president of the Newark Board of Trade, who will deliver an address from the balcony of the armory building at 8 o'clock Saturday night.

San Jose Show Opens with Pageant.

Following the example of Los Angeles, San Jose, Cal., inaugurated yesterday its automobile show, which is scheduled for February 17-20, inclusive, with a pageant and parade. V. A. Hancock, who is promoting the affair, has arranged for the purchase of a silver trophy to be donated to the owner of the best decorated car. The show itself, which is held in the Auditorium rink, will follow the lead of the more pretentious national exhibitions to the extent of having uniform signs which will form the chief motive of the decoration.

Trenton Abandons Its Proposed Show.

The automobile show which was to have been held in Trenton, N. J., on February 18, 19 and 20, has been abandoned. The military board in control of the local armory wanted too much money and no other building in the city was available for the purpose.

DENVER'S FIRST SHOW A SUCCESS

Representative Display of Automobiles, Motorcycles and Accessories—Some Local Products Exhibited.

A striking monument to western enterprise, the first automobile show held under the auspices of the Denver Automobile Club draws to a close tonight after a three days run in the big Auditorium. The show opened on Tuesday last, 16th inst. For its purposes, the cement floor of the auditorium proper, where the Democratic convention was held last year, was covered with a wood flooring which also is extended over one-half of the orchestra. With ample space for the exhibits so that the overcrowding which characterizes so many of the local shows was eliminated, an original and pleasing decorative scheme, and a good representation of the better known manufacturers, as well as one or two local products, the affair must be counted a remarkable achievement.

As a matter of fact, its success may be regarded as all the more noteworthy because the Denver Automobile Club has been in existence less than a year. It was formed only last July, since which time its membership has risen to its present strength of nearly 400. The show was its crowning achievement for the winter season and indeed, the biggest undertaking it has yet embraced. It was brought to a successful issue under the guidance of Ralph W. Smith, C. P. Allen, Edward F. Dean, George E. Turner and W. H. Sharpley, who constituted the show committee, and was conducted under the active management of Robert W. Spangler.

The total roster of exhibitors numbers something over half a hundred names, fully two-score of them being those of automobile manufacturers or their agents. A feature which attracted much attention was the motorcycle section, wherein no less than seven different makes of the two-wheeled machines were shown, while the accessory section provided its usual quota of instruction and diversion. The full list of exhibitors together with their wares, is as follows:

Automobiles—Barnett, W. W., Stoddard-Dayton; Bilz, Charles, Franklin; Botterill, Tom, Pierce-Arrow; Brinker-Vreeland Automobile Co., Matheson, Moon and Rauch & Lang; Central Motor Co., Midland; Colburn Automobile Co., Colburn; Colorado Automobile Co., Cadillac; Cumbe, E. R., Mitchell and Rambler; Denver Motor Car Co., Overland and Baker; Elkhart Motor Car Co., Sterling; Felker Automobile Co., Stevens-Duryea; Fernald Automobile Co., Maxwell; Ford Motor Co., Ford; Fritchle Auto and Battery Co., Fritchle; Griebel Motor Car Co., Speedwell; Hannan, George, Jackson; Havens Motor Car Co., Dorris

Digitized by Google

and Frayer-Miller; McDuffee, J. H., Chalmers-Detroit; MacFarland Automobile Co., Packard and Buick; Mathewson, E. Linn, Thomas, Oldsmobile and Columbus; Narmore, Jesse C., Reo; Newson, C. S. White; Studebaker Automobile Co., Studebaker; Tobin Motor Car Co., Apperson and Peerless; Wilson, A. T., Kisselkar and Oakland.

Motorcycle Section — Botterill, Tom, Pierce and Harley-Davidson; Boot Motorcycle Co., Reading Standard; Hathaway Motor Co., Indian; Mead, P. A., Excelsior; Williams, Fred H., Thor and N. S. U.

Accessories—Boss Rubber Co., tires; George J. Kindel, automobile cleaner; S. E. Gillard, agent, tires; Carstarphen Electric Co., electrical supplies; Scott Tool & Supply Co., automobile supplies; Denver Auto Goods Co., automobile supplies; Metal Polish Shop, automobile polishes; Consolidated Supply Co., automobile supplies; Auto General Supply Co., automobile supplies; General Electric Co., mercury arc rectifiers; Westinghouse Electric & Mfg. Co., mercury arc rectifiers; Continental Oil Co., automobile oils; Atlantic Refining Co., automobile oils; Great Western Oil Co., automobile oils; G. D. Wands & Co., automobile safety locks; Pickens Bros., automobile clothing; Standard Carriage Works, automobile tops; Brooke Airless Tire Co., tires; National Paint & Mfg. Co., automobile paint.

Pipestem Makes Emergency Repair.

Motorists who smoke a pipe may find a useful suggestion in the experience of a resourceful driver. While bowling along with everything apparently working properly, the engine—of the single cylinder type—suddenly developed a skip, accompanied by popping in the carburetter. The car was brought to a halt and investigation disclosed a choked carburetter jet. After disconnecting the gas making apparatus, in removing the choked jet for cleaning, it broke in two in the jet chamber. This calamity was further enhanced by the fact that the carburetter was of an antiquated type, and no spare jet was available. While casting about for a way out of the difficulty, the idea of using the round vulcanic pipestem presented itself. Fortunately it proved to be of a suitable size, with the additional good feature that it readily lent itself to the requirements of a jet. While not performing the functions of its predecessor quite so satisfactorily, with a few changes in the air adjustment the engine was easily started and the car brought home.

Keeping Control of the Pedals.

With a car traversing rough roads, the position of the driver should be such as to prevent the feet being jolted off the foot pedals. The clutch should always be withdrawn in passing over a rough spot and the car allowed to coast, and if the feet are jarred off the pedals permitting the clutch to slam in, a great strain is put on the gear box mechanism.

ST. LOUIS TAKES A BIG JUMP

Manufacturers' and Dealers' Show Doubles Last Year's Figures—Local Makers Stage Several New Cars.

Among other features of greater or less significance at the St. Louis automobile show, which is being held this week from Monday until Saturday, is the presence as an exhibitor of automobiles, of an electric light and power company. The fact in itself may be presumptive evidence of the awakening of the electric current producers in certain quarters to the great possibilities of revenue derivable from the charging and maintenance of electric vehicles for which they are so aptly fitted. As a show, this, the third effort of the St. Louis Automobile Manufacturers and Dealers Association, is crowned with marked success. The transfer from the Jai Alai building to the Coliseum, made this year for the first time, has resulted in the provision of ample accommodation for the half-hundred exhibitors. Indeed, so active has the association's show committee under the direction of Manager Lloyd H. Rickart been, that practically twice as many exhibitors are in the show as took space in the last exhibition of its kind, while the number of different makes of car shown is about the same as the total number of exhibitors who were in evidence in 1908.

Of peculiar local interest are the exhibits of the St. Louis manufacturers—the St. Louis Car Co., Moon Motor Car Co., Dorris, Success, Victor, Darby and Eureka companies. Several of these have not shown their products before this year, as is true of the American Mors, Frayer-Miller, Darby, Victor, Success and Stanley. One or two of them, indeed, are brand new cars, notably the Darby, which also is numbered among the products.

Moving pictures of various automobile events of the past year figure in the show, as is customary at all such affairs, but in rather a novel way in this particular instance. Lacking a suitable auditorium, separate from the main place of exhibition, in which to show the pictures, it was decided to display them in the hall itself. Accordingly the lights are extinguished for a few minutes twice during each evening, while the pictures are projected from the east side of the hall to a screen on the west side. In addition to the efforts of the inevitable band, music is furnished by a mammoth Gabriel horn-organ, such as was used at the Palace show in New York.

The decorations are in red and black, the colors of the dealers' association. For the most part these colors predominate, but use also is made of deep blue and white to relieve any possible monotony resulting from over-indulgence in either of the other hues. As is the case at Detroit's show, which is running simultaneously with this, many of the exhibitors made use of the Chicago show in drawing material for their displays, and in consequence a twenty-car special train left the Windy City as soon after that show closed as it could be loaded, and was rushed through on fast freight schedule arriving just in season for the cars to be unloaded and rolled into place in the Coliseum before the opening on Monday night.

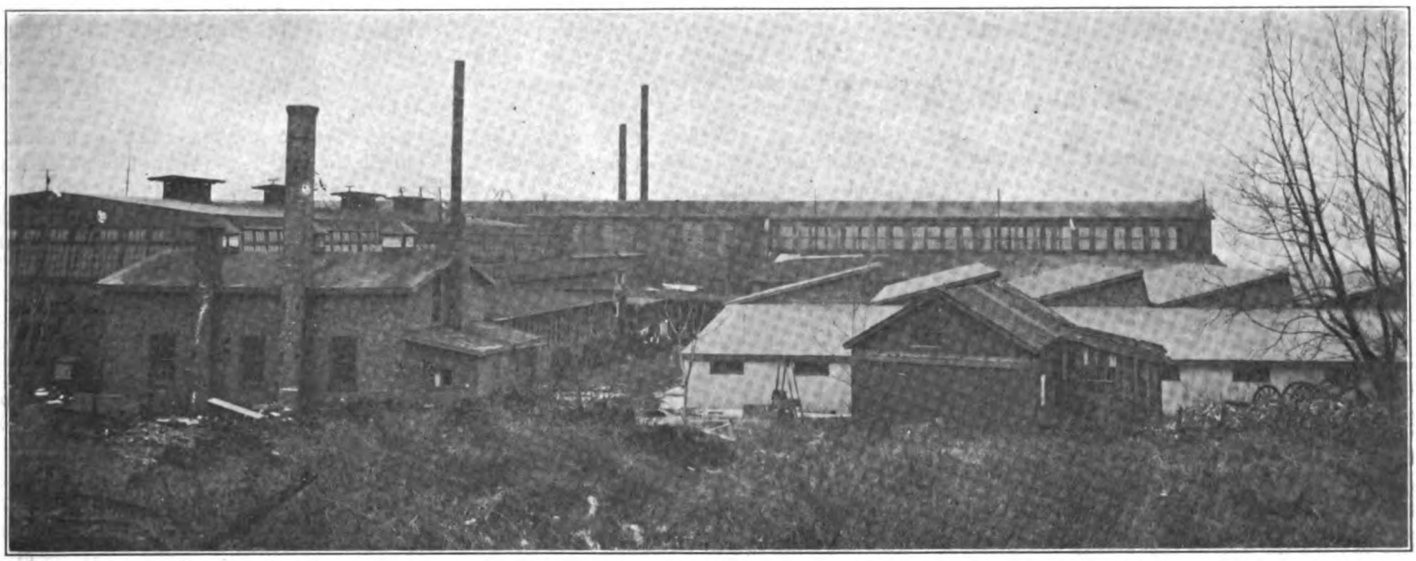
Opening night, despite the hindrances of a storm in which snow and wind combined to discourage the would-be visitors, proved in no sense an exception to the rule of automobile-show first nights. The crowd was there in response to the irresistable lure of the usual handout of "paper" and though as always is the case, no overwhelming business results were reported as coming from the opening session, the important object of advertising the show in all its magnificance was amply accomplished.

The preliminary list of exhibitors is as follows:

Automobiles: Bagnell Automobile Co., Cadillac; Brown, C. F. & J. R., Peerless; Buick Motor Co., Buick; Colonial Automobile Co., Studebaker and E-M-F.; Darby Motor Car Co., Darby; Deere Plow Co., John, Jackson; Delmar Motor Car Co., Regal; Dorris Motor Car Co., Dorris; Eureka Buggy Co., Eureka; Ford Motor Co., Ford; Gardner Motor Car Co., Franklin; Halsey Automobile Co., Stevens-Duryea and Packard; Jeffery & Co., T. B., Rambler; Kerdell Bros., Lewis, W. C., Reo, Wood's electric; Maxwell-Briscoe Motor Vehicle Co., Maxwell; Mississippi Valley Automobile Co., Stearns and Detroit electric; Moon Motor Car Co., Moon; Olds Motor Works, Oldsmobile; Park Automobile Co., Overland; South Side Automobile Co., Matheson, Corbin and Stanley steamer; St. Louis Car Co., American Mors; Swingley Motor Car Co., Stoddard-Dayton; Success Auto Buggy Mfg. Co., Success; Union Electric Light & Power Co., R. & L. and Studebaker electrics; Van Automobile Co., Marmon; Victor Automobile Mfg. Co., Victor; Western Automobile Co., Pierce Arrow.

Accessories: Barcus, J. Curtis; Behen-Faught Motor Car Equipment Co., Doyle-Curran Motor Car Co.; Chaudet, Felix R.; Electric Auto and Battery Co.; Henderson, Willis Welding and Cutting Co.; Horn Trunk Co., T. L.; Hurck Motor & Cycle Co.; Phillips Automobile Co.; Phoenix Auto Supply Co.; Union Electric Car Co.; Tam Oil Refining Co.; Travelers' Insurance Co.; Vehicle Top & Supply Co.; Weber Implement Co.; West St. Louis Machine and Tool Co.

American Cars at Edinburgh Show.



At the recent Edinburgh (Scotland) Motor show, America was represented by the White, Stanley and Ford cars. One of the novelties of the exhibition was a car which included three ignition systems in its equipment.

MAXWELL-BRISCOE PLANT EXTENDS

Ingersoll-Rand-Drill Works Added to the Tarrytown Establishment—Company Pushing Work of Alteration.

Rapid expansion of the business of producing Maxwell automobiles of various types has necessitated a further addition to the factory space already occupied, as a result of which the fourth plant in the chain established by the Maxwell-Briscoe Motor Co., has been assumed at Tarrytown, N. Y., where are the headquarters of the company and the principal shops. This was evidenced by the announcement last week that a lease had been taken of the factory formerly occupied by the Ingersoll-Rand-Drill Works. The extent and general facilities offered by the new works may be judged from the accompanying picture.

MAXWELL-BRISCOE MOTOR CO.'S NEW FACTORY AT TARRYTOWN, N. Y.

When asked about the significance of the acquisition, F. D. Dorman, secretary of the company, said: "Yes, it is true that we have leased the Rand-Drill Works to take care of our overflow. Our business has grown so fast that we have utilized nearly all of our available space, and it was impossible to put up buildings on the premises fast enough. We will take possession immediately."

This extension of the Tarrytown property is of considerable importance to Tarrytown itself, where are stationed at present about 1,000 Maxwell employes with an average weekly pay roll of $12,000. Work of adapting the new quarters to immediate use has been commenced already, and will be rushed through as rapidly as possible.

It is announced that for 1909 the combined output of the three factories now in service will amount to about 12,000 cars. For 1910, however, with the increased facilities available, a considerable increase is in contemplation. Indeed, it is said that present plans specify no less than 20,000 machines as the output.

New High Mark in Tire Mileage.

Tall records for tire mileage have developed during the past two years, but J. L. Martin, of Fowler, Ind., appears to have hit the high mark for a single set of pneumatic tires. He claims that with the one set of Diamond tires he has covered 40,872 miles, with no trouble beyond two punctures, according to the record kept by a reliable speedometer. By reason of the fact that this was the largest figure ever reported to the Diamond Rubber Co., of Akron, O., for a single set of its product, the company looked into the matter and asserts that analysis appears to verify Martin's claim. The car used was of the roadster type and Martin, being in the windmill business, drove almost constantly in his daily work, in addition to which he did considerable evening and Sunday driving for pleasure. His own estimate, aside from the speedometer figures, places his average daily running at 75 to 100 miles, and the mileage total which he claims for his tires was all made within a period of 18 months.

Tire Information in a Booklet.

Motor truck tires, together with the methods of applying them, form the subject for instructive illustrations and text in a special booklet just issued by the Diamond Rubber Co., of Akron, O. In addition to considerable general information as to tire practice in the commercial field, tables and diagrams are supplied which give valuable information as to tire, flange, band and felloe sizes. The manner of applying or removing Diamond wire mesh base and Diamond side wire tires is fully shown in halftone pictures and line drawings, while the various types of Diamond motor truck tires are also illustrated.

DEVELOPING EXPERT REPAIR MEN

School of Instruction in Operation at the Franklin Works in Syracuse—First Squad of Pupils Enlisted.

A school for the instruction of automobile repair men is one of the most recent undertakings entered into by the H. H. Franklin Mfg. Co., at its Syracuse (N. Y.) plant. The object is to render it possible at any time for the company to furnish any of its 150 dealers throughout the country with trained and competent help. In this way it is hoped to relieve the dealers of what has become a very troublesome problem within the past year or two.

The work is being inaugurated under the direction of I. O. Hoffman, formerly an instructor in the College of Applied Science at Syracuse University, and the school will be housed in a building now approaching completion. According to the present plan of operation the recitation hours are to be at night, and the course can be completed in from 28 to 35 weeks. Already the first squad of pupils is at work in the engine assembly room and other parts of the factory. They are employes of the factory and are to continue as such during the period of special instruction. Admission to the classes is obtained through special familiarity with machine shop work or with the gasolene motor.

Among the special equipment of the school will be several Franklin engines showing the changes in design in the successive years on from 1903; and parts of cars, used in the construction of the various models during the same period. The development of the carburetter, the rear axle and other parts will be demonstrated by the display of the parts themselves for the several years.

HOW TO COMPILE THE CATALOG

Some of the Most Common Faults Pointed Out by an Expert—His Suggestions for an Ideal Compilation.

It is a tribute to the bright and energetic spirit which pervades the automobile industry that the subject of cataloging their products has been given a huge expenditure of attention and money by the manufacturers engaged in the field, practically without exception. At the same time it is a fact beyond question that much of this outlay has been ill-advised. In some instances the investment in letterpress and cut work has been out of all proportion to the probable returns obtainable and the volume of business done, while in others its distribution has been made without proper regard to proportion, or the proper balance of the necessary elements which must enter into trade literature of the business-getting variety. Wholesale advice on the compilation of the effective motor car catalog, offered by Selling Magazine, indicates a number of points in which many of the automobile manufacturers might improve the efficiency of their catalog systems.

"The most common fault in motor car catalogs is the lack of a summary of the constructional changes incorporated in the new models," says the print in question. In fact, the writer avers that after an inspection of practically every piece of advertising matter issued by the motor car manufacturer during the past eight years, but one, and that of very recent issue, has come up to the mark in this important respect.

"It should be borne in mind in compiling a motor car catalog that, generally speaking, two classes of readers are being addressed," he continues, "one familiar with the specifications and constructive features of previous models of the car described; the other class ignorant of the same. Hence, either a special catalog must be prepared for each class or one catalog arranged to meet the needs of both classes. The single catalog idea is best under usual circumstances. For the information of the partly informed reader, for example, a user of a previous model of the car, the changes in the new model should be given a prominent position in the catalog so that he can readily obtain the data he desires without wading through a lot of descriptive matter with which he is already familiar. If the new features are brought prominently to his attention he is much more liable to be impressed by the merits of the changes, and will be more easily convinced of the advisability of his purchasing the new model. On the other hand, for the guidance of those who know nothing of the car, a small index, or references of some sort, should be placed near or immediately following the summary of changes, directing the reader to the pages on which can be found fuller details and explanations of the value of the changes, and detail data regarding the various features of the car.

"Preceding the summary of changes, an introductory outlining the manufacturer's claims to the reader's consideration, would add to the strength of the catalog, especially if the manufacturer has an exceptional reputation, many years experience in the motor car or some other mechanical field. . . . . or any strong argument in his favor. Naturally, it is impossible to give very definite advice regarding this introductory, as each case must be handled on its own merits, but a few general observations will not be amiss. . . . . The car's performances in contests might also be mentioned in a general way, but to avoid undue length, full details regarding victories and trophies won in contests should be reserved for special mention in another part of the book.

"Following the introductory and the summary of changes should come explanations of the changes, and then details regarding the exclusive features of this make of car; that is, particulars regarding such constructive features as make it different from other cars—the reasons for its existence, as it were.

"The arrangement of the illustrations is a very weak point of many motor car catalogs. Apparently no other method has been followed than that of scattering the illustrations to break up the reading matter. . . . . Instead of scattering the illustrations of the various models through the catalog, with their specifications scattered in other parts, the cuts and specifications should be paired up so that anyone can refer to the specifications of any model as he examines the illustration, without fumbling pages back and forth to various parts of the catalog. The most stupid blunder in this mixing of specifications and cuts is the habit of placing an illustration of, say Model A with the specifications of Model B facing, and a cut of Model B backing up the page containing its specifications. . . . . .

"Where the size of the catalog permits the use of a full page for the cut, and another page for the specifications, the two pages should face each other, and in any case the cut should be placed with the base parallel with the lines of the text, so that either cut or text may be referred to without turning the book. The less mental fatigue and inconvenience caused by getting at the contents of a catalog, the more easily will those contents be absorbed and retained by the reader. . . . .

"So much of the text matter; to revert to the illustrations, the most effective for the front part of the book are attractive landscapes, with the car in favorable settings. Such illustrations placed either on pages opposite the reading or used on the same pages as the reading to break it up, will brighten up the pages and help to create a desire to own a motor car, or intensify that desire, if it already exists. These illustrations will help hold the reader's attention while he reads the introductory and summary of changes. Throughout the description of exclusive features, line drawings and phantom half-tones will serve to impress on the reader's mind the various points in which the car differs from others, and show him why these features have been adopted. In the description of general features, cuts of the important parts, such as the motor, change gear, axles, etc., can be used to advantage, and by all means a plan view of the complete chassis should be used, as it shows the arrangement of the various parts and enables the reader to follow the description much more intelligently.

"Nothing has been said of decorative illustrations, cover design and other artistic features, the object of this article being to call attention to certain practical features which should be common to all motor car catalogs.

"The ideal catalog herein suggested, is planned first to get the reader's attention by suggesting by illustration the pleasures of motoring while he peruses the first few pages, and learns of the stability and standing of the manufacturer; then holding his interest by vivid illustrations and descriptions of the distinctive features of the car —its talking points—until he has a desire to read the general description and learn of the various models offered, and of the performance of the car, all of which may create a desire to possess the car advertised."

Proper Treatment of the Oil Lamp.

It is the practice generally among motorists when extinguishng their oil lamps to turn down the wick to save wear and tear on the door hinges which frequent usage occasions. Instead of turning the wick up again, when the flame has gone out, it is usually put off until the lamp is again required, by which time it is forgotten which way to turn the thumb wheel to bring the wick up. The operation in many cases results in the wheel being turned the wrong way, and the wick dropping down into the oil reservoir, whence it has to be fished out, a proceeding which is not likely to add to the motorist's amiability. While the best way to extinguish the light is to open the door of the lamp and blow it out, thereby leaving the wick in a proper position for relighting, those motorists who insist on adhering to the practice of turning down the wick to extinguish their lamps should turn it up again before leaving it, so that it will be in a proper position for future use.

Precaution that Will Obviate Trouble.

When valves are to be ground it will be found worth while to tie a piece of strong cord to a piece of waste and push the latter into the cylinder. In the grinding operation if any of the abrasive should drop into the passages, the waste will prevent its finding its way to the interior of the cylinder, and it can be removed when the waste is withdrawn by means of the string.

FOR RECTIFICATION OF CURRENT

Simplicity the Feature of the Westinghouse Charging Sets—Almost Automatic Character of Their Operation.

Perhaps no single factor can be said to have contributed more forcibly to the practicability of the electric vehicle for the private owner than the development of the mercury arc rectifier whereby the alterations of the current commonly sold for lighting purposes can be eliminated and a direct current developed. As the direct current alone is useful for charging purposes, without the use either of some apparatus corresponding in action to the rectifier or a mechanical motor-generator, it would be necessary in many instances either to recharge batteries at special stations, or else to install separate wiring systems for this purpose alone. With the introduction of the rectifier the requirement of costly installations of either variety was done away with and the use of the alternating current brought directly within the range of the small consumer as well as the non-technical user of the electric automobile.

In this connection attention is directed to the battery charging sets produced by the Westinghouse Machine Co., Pittsburg, Pa., which are especially designed for use in public as well as private garages and for which an extremely high efficiency is claimed at both full and light loads; as well as simplicity in operation, compactness and long life. Two styles are produced, one for charging batteries of any sort, and designated as type "A," and the other, which is known as type "E," which is a small, self-contained rectifier set intended to be used in charging ignition batteries. It is similar in principle and action to the more pretentious and higher capacity types of rectifier produced by the same company, but is mounted on a small panel board which may be bolted to the wall where it occupies a minimum of space.

WESTINGHOUSE TYPE "A" MERCURY RECTIFIER, OPEN AND ENCASED

The operation of these instruments is extremely simple. It is only necessary to set the regulating dial pointers according to the table on the instruction card which accompanies the outfit. The rectifier then is cut into the vehicle battery and the primary current supply switch closed. The apparatus is immediately started, and proceeds to supply direct current. No readjustment is necessary during the charging. If at any time the current is interrupted for any reason, the rectifier automatically stops itself. This permits the individual owner to run the vehicle into his private garage, connect it to the charging outfit and retire, knowing that in the morning he will find his batteries fully charged and ready for service. In other words, an outfit of the sort enables him to give the vehicle practically all the attention it requires with practically no expenditure of time or labor.

SOME COLD WEATHER PRECAUTIONS

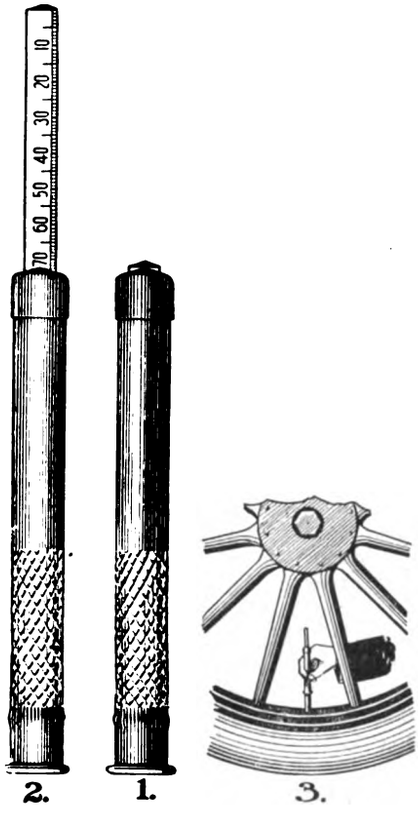
Danger of Starting the Engine When the Water Pipes are Frozen—How to Prevent or Deal with Trouble.

Knowledge of the damage which may result if an attempt is made to start the engine while the water pump is frozen would seem to be a sufficient incentive to insure precautions being taken to prevent such an occurrence. While it may appear a matter easy of accomplishment to drain all the water from the cooling system of a car, experience has taught otherwise. When the car is stored in an unheated building with the attendant possibilities of trouble, the careful motorist takes pains to open the drain cock before leaving and assuring himself that all water is permitted to escape from the pipes. While these precautions would seem to be sufficient, an invisible agency is making for trouble. After the main body of water has been drained off, taking with it a large proportion of heat, the pipes cool rapidly. There still remains, however, a film of water on the inner walls, which slowly finds its way to the lowest part of the system, which frequently happens to be the pump. During the interval the pump probably has reached a freezing temperature, so that instead of finding its way out of the system, the water congeals.

The water pipes being closer to the cylinders naturally retain their warmth for a longer period and the water in them continues to trickle to the pump until the pipes also become clogged with ice at the pump inlet. When the system is filled with fresh water, and the engine is turned over, the pump goes to pieces. Even if hot water be used to hasten thawing of the ice the possibility of trouble is yet present, for it takes quite some time to melt the ice.

If the pump tap be opened, and water allowed to run out from it, before starting the engine, it will be a reasonable assurance that the system is open. Great care should be exercised to see that the pump is free, before turning over the engine, inasmuch as the latter turns stiff when cold, and owing to the great leverage secured at the starting crank the pump easily may be put out of commission, without the operator being made aware of it. Under these conditions, the spring drive for the pump is of great value, as its action will permit a quick discovery of a clogged shaft in time to prevent serious damage.

Avoid Quick Drying Varnishes.



"Avoid using quick-drying rubbing varnishes so far as possible," observes the Carriage Monthly. "Motor car surfaces, as a rule, are wide reaching, and subject, during service, to great strain and intense vibration, both of which are alike destructive to varnish possessed of brittle tendencies."

FOR DETERMINING TIRE PRESSURE

Here is a Simple Gauge of Vest Pocket Proportions—Easy to Use and Tells the Story at a Glance.

It is seldom realized by the average motorist what an important bearing the proper inflation of his tires has on their life, and the amount of service which they give. While the manufacturer has striven diligently to impress on him the necessity for keeping his tires pumped to just the right pressure, if he would desire the fullest satisfaction from their use, the user is prone to be guided by rule-o-thumb in this important matter.

A prime regard for comfort may induce him to run his tires partially inflated, but the continuous flexing of the tire at an acute angle, when passing over obstructions soon results in a rupture of the fabric, which pressages rapid disintegration.

Pressure gauges have been recommended as a means of overcoming this trouble, but many of those which have been available for this purpose, were either expensive or inaccurate. To meet the demand for an instrument at a reasonable price, which would enable motorists to quickly and easily ascertain the proper pressure for their tires, the W. D. Newerf Rubber Co., of Los Angeles, Cal., is introducing the Twitchell air gauge.

In the accompanying illustration Fig. 1 shows the device in closed form, its total length being 3½ inches, making it convenient to carry in the vest pocket. Referring to Fig 2, the gauge is shown extended as in use, and its practical application to a tire is depicted in Fig. 3. The Twitchell gauge is guaranteed to register accurately and is claimed not to be liable to derangement under ordinary conditions.

This Tire Promises a Revolution.

Again has "the perfect substitute for the pneumatic tire" been found, and " the resiliency and elasticity of the pneumatic tire has been retained while objections thereto have been overcome." This time the solution comes from Chicago, and in place of air the inventor proposes woolen yarn. Being a maker of pool table pockets and fringes, F. M. Georgi, of the Windy City, is intimately familiar with the ability of woolen cords to absorb such objects as pool balls, "pills" and cubes of cue chalk, and this quality appeals to him as of possible practical application in swallowing the shock of road pebbles, stones and other road roughnesses. As a substitute for the air inflated inner tube, therefore, he has devised a filling consisting of closely lying woolen strands held together by an external wrapping of cord. The convolutions of the cord are "in mutual contact" making the core look like one of those elaborately wrapped imported goose liver sausages, which are the delight of the delicatessen epicure. The core is placed in the usual outer shoe, but the latter is laced tightly over it. According to Georgi's theories, "the core gives to the tire the required elasticity and resiliency, equal in all respects to the usual inflated tire, while the weight is much less."

Tells of Progress in Locomotion.

That chapter of evolution which deals with vehicular development though frequently retold, always is pertinent in connection with the improvement of the motor vehicle—most wonderful vehicle of all. Rehearsed in brief and entertaining form together with suggestive half-tone page headings, it has just appeared in a brochure entitled "Progressive Locomotion," and forming about one-half of the subject-matter of the pamphlet. The other half is devoted to the entertaining "life story" of the automobile tire, which was recently printed in these columns, and which is thus incorporated into the literature of the Firestone Tire & Rubber Co., Akron, O., by whom it was produced. In addition to illustrations showing the development of the tire from tree to wheel, a limited amount of space is devoted to illustrations of the various Firestone tire products.

Symptoms in the Acetylene Light.

If acetylene lamps are observed to light up quickly with a yellowish flame, the symptom may be taken as indicating a leak. When the system is in proper condition the light should start up slowly with a hissing noise and a clear white flame.

BATTERY TESTER OF A NEW TYPE

Pocket Volt-Ammeter with Many Notable Improvements—How It Combines Two Instruments in One.

For 1909 the Connecticut Teleprone & Electric Co., Meriden, Conn., have increased their already numerous line of pocket meters by the addition of a new type of dead beat volt-ammeter for testing batteries. Many notable improvements have been incorporated in the new instrument which tend to increase its efficiency.

Most conspicuous among the advances is the use of an etched metal dial replacing the former paper card dial, which is now universally used for this purpose, and in addition greatly enhances the appearance of the instrument.

The new dial eliminates warping and bulging, a fault common to the paper dial and which caused the pointer to stick in taking a reading. Internally the construction has been redesigned and is now non-oscillating. Last but not least, the pointer has received attention, and is of a new type.

This instrument is but one of a number of different styles of pocket battery meters which are made by the company in question. The volt ammeter is as a matter of fact, two instruments in one. The voltage side is used in testing the pressure on storage batteries, while the ampere side is employed in ascertaining the strength of dry cells. In the former instance, as the makers of the instrument explain, each cell when tested individually should show 2½ volts after the battery is fully charged and is still charging, while an indication of less than 1.7 volts, should be taken as an intimation that recharging is necessary. A storage battery on open circuit, when fully charged should show between 2 and 2.2 volts. In testing dry cells, each unit should be tried out separately, the minimum of 6 amperes being sufficient indication that a new cell is required.

BUCKING THROUGH SNOWDRIFTS

Four Secure Perfect Scores in Rochester's Endurance Run—Must Again Contend for the Two Trophies.

With heavy drifts of snow at least four feet high barricading the road in many places the first annual midwinter endurance run of the Automobile Club of Rochester on Thursday last, 11th inst., scarcely can be designated as a pleasure run. The only part of the route that did not bother the 16 contestants was in going out of Rochester. An investigation held later in the week by the police of that city disclosed the fact that Rochester's street cleaning department had little to do the remainder of the week but to play pinochle, seven-up at 5 cents a corner, and other harmless amusements. It is stated on none too good authority, however, that residents along the line of march, or rather scorch, could not go out doors for several days without first getting into hip high boots. Such a burning pace was set by the automobiles, it is asserted, that the snow melted and flooded the streets.

Whether this be true, or merely the sour-grape noise made by the unfortunate class of non-motorists, it is certain that nearly all of the 16 starters managed to survive the wind-biting, snow-bucking journey from Rochester to Buffalo and return, and equally certain is it that at least four of the drivers managed to check in on time, without having made repairs, and thereby earned perfect scores. After all the hard work occasioned by driving a car over 151 miles of snow-choked country roads in 9 hours 10 minutes the fortunate quartet did not get the promised reward. There were only two cups up for the two best scores and it is not an easy matter to divide that number of trophies between twice as many drivers. In view of this the perfect score quartet—who by the way are Henry Selden (Selden); William C. Barry, Jr., (Selden), Richard Guyer (Cadillac), and F. Q. Shannon (Gearless)—some time within the next two or three weeks will have to do the stunt all over again in an effort to break the present tie.

The heavy drifts of snow encountered between Rochester and Batavia, the first checking station, were of the mountainous variety and the drivers had to scorch at every available opportunity in order to cover the distance at 35½ miles in the allotted time of 2 hours 20 minutes. Better roads were met with later, and 2 hours 10 minutes were allowed to cover 40 miles. Upon the return trip a slight deviation of two miles was made.

Most of the trouble experienced by the drivers was due to the drifts, which resulted in stalled motors and clutch trouble. Ora D. Davis (Gaeth), Ray Bettys (Cadillac), Edward White (Mitchell), F. W. Peck (E-M-F.), William Bennett (Chalmers-Detroit), Harold Pye (Cadillac), and L. B. Kirkpatrick (Oakland), lost points through these troubles. A. V. Hart (Thomas) lost one point for checking in ahead of time, while Charles Young (Selden) was assessed 18 points because of delays caused by carburetter difficulties. The Brush, driven by George Berger, lost the maximum number of 1,000 points.

There were only two accidents and one of them, fortunately, did not prove serious. In rounding a sharp turn east of Buffalo the Selden car driven by Hector Caramella turned turtle and was wrecked, the driver escaping with light injury. Earlier, Bert Van Tuyle, in the pacemaking car, ran into the ditch on the same turn, but the car was quickly righted and proceeded toward Rochester. Charles Young was disqualified for speeding. The official summary, showing the points assessed each driver, is as follows:

Driver. Car.	Points.
Henry Selden, Selden	0
William C. Barry, Jr., Selden	0
Richard Guyer, Cadillac	0
F. Q. Shannon, Gearless	0
Ora W. Davis, Gaeth	1
Harold Pye, Cadillac	1
A. V. Hart, Thomas	1
Ray Bettys, Cadillac	2
William Bennett, Chalmers-Detroit	3
L. B. Kirkpatrick, Oakland	6
Fred Wilson, Selden	18
F. W. Peck, E-M-F.	33
Edward White, Mitchell	95
Charles Young, Selden	1,000
Hector Carmella, Selden	1,000
George Berger, Brush	1,000

Willard Wins in Houston's First Run.

P. W. Willard, driving a Stearns car, was the only one of five drivers that participated in the first endurance contest promoted by the Chauffeurs' and Auto Mechanics' Club of Houston, Texas, from that city to Beaumont and return, Saturday and Sunday, 7th and 8th insts., who finished with a perfect score, not a point having been marked against him for making repairs or breaking any of the rules. Sherman Brady, Franklin, lost only five minutes in making repairs, while George Ayres, Dixie-Seven, was delayed several hours after running into a stump. Their desire to reach Beaumont first proved the undoing of D. B. Kent, Chalmers-Detroit, and J. W. Bell, White. After reaching the city limits Bell and Kent raced for the control at the Crosby House, and this act resulted in their disqualification.

Germans Plan a Big Motor Speedway.

Germany is to have a Brooklands of its own if the plans of the promoters of the project materialize. A company with a capital of $100,000 has been formed to sponsor the scheme, and it is proposed to build the new course in the vicinity of Potsdam. Work on it will be begun immediately, with the idea of holding the opening meets in the autumn.

PLUGGING THROUGH MUD PUDDLES

Eighteen Perfect Scores Made by San Francisco Endurancers—Only Two Failures—Tires to Blame.

Plastered with mud so thickly that both cars and passengers scarcely could be recognized, 18 cars of a possible 20 entered in the 200 miles endurance "mud-plug" of the San Francisco Automobile Dealers Association, Sunday, 7th inst., finished with perfect scores. Despite the fact that the roads were covered with mud, the cars rolled off miles through rain and hail with clocklike regularity, and the two cars that failed to finish on time were retarded by tire troubles.

Although it was pouring rain at 6.30 a. m., 20 cars started from Van Ness and Golden Gate avenues, at one minute intervals. The course was to Twelfth and Broadway, Oakland, a checking station being established at San Jose to insure the cars running all the way around the bay and covering the required distance of 200 miles.

From the time the cars left the paved streets of San Francisco until they entered the confines of Oakland, mud in all its forms, from sticky adobe to deep slush, was encountered in wholesale quantities. From the city limits of San Francisco to Redwood City the roads were in terrible condition, and more than one of the cars had difficulty in getting through this part of the course successfully.

Several hairbreadth experiences were related by the survivors. Among the number was Charles S. Howard, chairman of the tours and runs committee of the association. In following a supposed short cut Howard allowed a team to take a bridge ahead of him, and he thanked his lucky star that he did so, for both horses went out of sight in the muddy water, which proved to be the only support of the deceptive structure.

Of the two cars that failed to finish on time, both were victims of tire trouble. The Premier driven by G. W. Freeman was the most unfortunate sufferer in this respect. Freeman had to stop seven times to attend to tires, but despite these setbacks almost made up his time, being only six minutes late at San Francisco. The other car that failed to finish was a Tourist. Following are the drivers who made perfect scores:

L. B. Harvey, Rambler; C. S. Howard, Buick; J. H. Eagle, Studebaker; F. Mick, Apperson; M. S. Harris, Studebaker-E-M-F.; F. Murray, Buick; Max Rosenfeld, Peerless; E. L. Cutting, Ford; R. C. Anthony, Reo; E. S. Martin, Mitchell; Norman de Vaux, Auburn; A. E. Hunter, Mitchell; C. Aurandt, Tourist; A. D. Plughoff, Stoddard-Dayton; C. Christenson, Buick; F. Stork, Franklin; R. G. Fowler, Overland, and Walter Morris, Autocar.

BIG CARD FOR FLORIDA SANDFEST

Twenty-two Events on Program for Four Days Meet—Schedule of Contests and List of Prizes.

Announcement was made this week of the program for the seventh annual sandfest on the Ormond-Daytona beach. This year the affair is to be promoted by the Motor Contest Association, Inc., as manager, of which W. J. Morgan retains his long cherished position as personal director of the project. At the same time, the affair is characterized as being "under the patronage of" the Florida East Coast Automobile Association, which means that the Ormond end of the old-time rivalry is entirely shut out of the profitable phases of the meet. Entry blanks have been issued, and entries will close March 10th with the manager, whose office is in the Thoroughfare building, 1777 Broadway, New York City.

The program announcement calls for no less than 22 events to be contested during the four days of the meet, which include in addition to the automobile items, motorcycle and bicycle races and a series of aeroplane speed trials—all duly sanctioned and to be run under the rules of the American Automobile Association, Automobile Club of America, Federation of American Motorcyclists and the National Cycling Association, as properly arranged. Numbered among the 1[illegible] events devoted to automobile contests will be the two-miles-a-minute speed crown race, against Demogeot's record of 58⅕ seconds; the Vanderbilt Cup competitors' race, open to all cars in past Vanderbilt cup contests; a 200 miles piston displacement class race, and others. The list of events in full is as follows:

No. 1: Florida Stock Car Price Class Race, 200 miles.—Class E: Cars listing at $999 and under. Class D: Cars listing at $1,000 to $1,750. Class C: Cars listing at $1,751 to $2,450. Class B: Cars listing at $2,451 to $3,750. Class A: Cars listing at $3,751 and upwards. First prize in each class, $200 cash or plate; second, silver shield; third, gold medal. Entry fee each class, $50.

No. 2: Piston Displacement Class Race, 200 miles.—Class F: 230 cubic inches, (for example up to 4-inch bore, 4½ stroke). Class G: Between 230 and 320 cubic inches (for example up to 4½-inch bore, stroke 10 per cent. greater). Class H: Between 320 and 460 cubic inches (for example up to 5-inch bore, stroke 10 per cent. greater). Class I: Above 400 cubic inches (all above Class H limit). First prize in each class, $200 cash or plate; second and third, gold and silver medals. Entry fee each class $50. A special prize of $250, in cash or plate, to the driver who produces the best results in both this race and in the price class race combined.

No. 3: Minneapolis Trophy Race, 100 miles, for the $2,000 Minneapolis Trophy—First prize, $300 cash or plate; second, $150 cash or plate; third, $50 cash. Special prize if winner covers 100 miles within one hour. Entry fee, $50. Present holder of trophy, the Fiat, which, like the Mercedes and Napier, has won it once. It must be won twice to become the property of the winner, not necessarily in succession.

No. 4: Two-mile-a-minute Speed Crown Race—Winner to receive the Gold Speed Crown, and $300 cash or plate; second, $150; third, $50. Winner must equal 120 miles an hour. Entry fee, $50. Present holder of two-mile record, Victor Demogeot, Darracq, who covered the two miles in 1906 in 58⅕ seconds.

No. 5: One mile, best two in three heats, record race for the Sir Thomas Dewar $2,000 trophy, to be given outright, with $250 cash or plate to the winner; $150 to the second, and $50 to the third. Present holder of trophy, Fred Marriott, mile record, 28⅕ seconds. Entry fee, $50.

No. 6: International Free for All Race, 1, 5 and 10 miles, best two in three—First prize, $300 cash or plate; second, $150 cash or plate; third, $75. Entry fee, $50.

No. 7: Southern Price and Horsepower Handicap, 5 miles, open only to residents of Southern States—Prizes, gold and silver medals. Entry fee, $10.

No. 8: Vanderbilt Cup Competitors' Race, open to all cars in past Vanderbilt Cup Races, 50 miles.—Trophy and $400 cash to winner; second, $250; third, $100. Entry fee, $50. Must be four starters.

No. 9: One Mile Record Gold Medal Races, best in two in three, open only to entrants in events Nos. 1 and 2.—Silver and bronze medals for second and third in each class. Entry fee, $20.

No. 10: Motorcycle Marathon, 100 miles, two classes, 30-50 and 61 cubic inches piston displacement. F. A. M. rules. Prizes, gold, silver and bronze medals. Entry fee, $5.

No. 11: One hour Motorcycle record race, to beat the Brooklands, England, track record of 67 miles 1,655 yards, standing start, two classes same as above, F. A. M. rules. Silver shield to first; bronze shield to second. Entry fee, $5.

No. 12: Aeroplane speed trials.

No. 13: Invitation Match Race, George Robertson, Lewis Strang, Herbert Lytle, Ralph De Palma, and other noted drivers. Purse, $1,000 gold. Must be three starters.

No. 14: Motorcycle Speed Trials, kilometer, mile, 5 and 10 miles.

No. 15: Bicycle Races and Trials.

No. 16 to 22: Amateur and professional straightaway bicycle championships under the sanction of the N. C. A., ¼, ½ mile, kilometer and mile races. Cash prizes to professionals and medals to amateurs. $1,000 in prizes. $150 cash extra for the fastest mile. Mile motor paced bicycle record trials. Prizes, $100 first prize for each professional race, $50 to second, $25 to third. Entry fee, amateurs, $1. Professionals, $2.00.

Incorporates to Build a Speedway.

The Indianapolis Motor Speedway Co., which is the corporate title of the body promoting the project of a huge motordrome at Indianapolis, Ind., has assumed tangible shape. Articles of incorporation naming a capitalization of $250,000 were filed last week, and it is stated that an engineer's office having been opened on the ground of the proposed course, the work of surveying the track is already under way. Contracts have been made with the Aero Club of America to have the course finished by June 1st in order to serve as the starting point of the next balloon race.

AMERICA WINS THE DEWAR CUP

Royal Automobile Club Awards the Trophy to the Cadillac—Award Based on Last Summer's Standardization Test.

Announcement was cabled this week that in acknowledgment of the remarkable standardization test of last summer the Dewar Cup has been awarded to the Cadillac Motor Car Co., of Detroit. The significance of the honor may be appreciated when it is understood that the rophy is awarded annually by the Royal Automobile Club of Great Britain for the most noteworthy performance of the year. This is the first time in its history that the cup has been presented to an American manufacturer. The award is based upon the special trial conducted by a special committee of the R. A. C. last summer when, following a 25 miles road test, three Cadillac cars were completely dismantled, their parts interchanged and mingled with certain other parts taken from stock, three new cars subsequently being assembled from the material in hand. No fitting of any sort was permitted during the test, and all three cars afterward were run a 25 miles endurance on the Brooklands course, where they averaged nearly 30 miles an hour. The demonstration created quite a sensation in England at the time.

Planning New York to Seattle Race.

Thomas Francis Moore, who modestly disclaimed all knowledge of the project, when the idea of a New York to Seattle race for next summer first was broached, has at length been won over to the scheme and is reported to be actually on his way to Seattle where he will interview the commissioners of the Alaska-Yukon-Pacific Exposition and the governors of the Seattle Automobile Club in an effort to arrange the details of the contest. Conceived by the officials of the exposition, the plan was at once placed under the patronage of Robert Guggenheim, who has donated a $2,000 trophy for the main prize, in addition to which cash prizes will be offered; amounts aggregating more than $5,000 already have been promised, according to the promotors. It is planned to start two pathfinding cars, one from New York and one from Chicago on March 15th, while the start of the race itself will occur either on May 15th or June 1st, according to the condition of the roads.

Date for Altadena Hill Climb.

The annual Altadena hill climb promoted by the Automobile Dealers Association of Southern California, which is one of the most important contests of the sort held in America, will take place on the hill between Pacadena and Altadena Monday next, 22d inst. Several important changes have been made in the rules governing this year's contest.

CLARIFYING THE RACE SITUATION

Conditions Under Which the A. A. A. Becomes Sole Governing Body—Some of Its Promises for the Future.

Complete clarification of the racing "situation," by which the American Automobile Association will hereafter be the sole recognized and authoritative governing body in the United States, has been undertaken by the combined forces of the Association itself and of the motor car manufacturers and importers who for a time threatened to set up an alleged race control association of their own. According to the program which has been decided upon, the A. A. A. will not only govern all of the large events, but will abandon its position as to automobile racing on small horse tracks, no longer leaving this form of racing to uncontrolled and irresponsible promoters.

Furthermore, the plan provides that the powers assumed by the Automobile Club of America in its celebrated "peace agreement" with the A. A. A., as to the control of "international" races held in this country, are in the main to be restored to the association by acquiescence on the part of the Club. The latter is thought to have no warm enthusiasm over being involved in the difficult task of controlling and sanctioning race meets which become "international" through the simple process of being advertised as such, and it is believed that it will yield part of the fruits of its diplomatic victory to aid the racing cause.

Matters came to a head as the result of the formation at Chicago during the show of an organization known as the Manufacturers' Contest Association, having for its general object the protection of the manufacturers' interests in racing matters. A meeting of makers and importers anxious for an improved government of racing matters had been held at the Hotel Victoria, New York, in January, during the Madison Square Garden show, at which time the sentiment had been largely for an independent governing body composed of the makers and importers themselves. The impracticability of this idea, however, was sufficiently apparent to make the later meeting at Chicago take a different turn.

While the makers organized, in accordance with the tentative program advanced at New York, they dismissed the plan for a governing body of their own, and decided to support the A. A. A. as the proper organization to control racing. Nevertheless, they undertook to advance their common interests as far as possible by seeking recognition in the counsels of the A. A. A. in racing matters so that the wishes of the manufacturers as a body might be given due consideration in the framing of rules and the regulation of contests in general.

The meeting at Chicago was held on February 10, 35 manufacturers and importers being in attendance. Benjamin Briscoe, of the Maxwell-Briscoe Motor Co., was elected president, and William E. Metzger, of the E-M-F. Co., secretary-treasurer, with Russell Field, of New York, as assistant secretary and Howard E. Coffin, of the Chalmers-Detroit Motor Co., as chairman of the committee on rules. The latter committee was determined upon to prepare racing rules framed as the racing interests themselves would like to have them, for the consideration of the A. A. A. Conferees were appointed to meet with the A. A. A. officials and apprise them of the new organization's attitude.

Negotiations with the A. A. A. have resulted in an agreement between the two bodies that the Manufacturers' Contest Association will support the A. A. A. in its control of racing and that the latter will give the M. C. A. recognition even to the extent of letting it have an advisory committee with a voice in the proceedings of the A. A. A. contest board. The contest board is composed of Chairman Frank B. Hower, Frank G. Webb and A. L. McMurtry, while the advisory committee from the M. C. A. consists of Alfred Reeves, E. P. Chalfant and E. R. Hollander, representing the "independent," the "licensed" and the importing elements, respectively, of the new organization. The function of the advisory committee will be purely "advisory," and it will have no vote as to the contest board's actions.

Rules governing all racing events for 1910 will be formulated by the rules committee of the M. C. A. and will be submitted for approval or alteration by the A. A. A. contest board, so that as finally adopted and promulgated by the latter they shall be ready before the first of September, thereby giving the manufacturers an opportunity in advance to construct the types of cars that will be eligible for the 1910 racing season.

Quite enspirited by the support which the manufacturers have pledged to it, the A. A. A. is exuding good resolutions and noble promises as to the strict but broad and impartial lines on which it will insist that automobile racing shall be conducted hereafter. Confessing that up to the present time its "control" of racing has been under a "haphazard and disjointed system," it forecasts for the future so gushingly as even to declare that no race will be sanctioned unless the contest board has positive assurance "that the spectator will be rewarded at least to the extent of the admission price," not to mention the measures that will be insisted upon for his safety. Indecorously alive to the trade side of the "sport," the Association intimates also that the makers who compete under the new order of things will receive "more good wholesome advertising and publicity" than before, and it is altogether lavish in picturing the thoroughness and efficiency with which it intends to exercise its powers.

Members of the M. C. A. express the hope that the A. A. A. will "make good" in shouldering it's responsibilities as it should and presenting a contrast to its jelly-spined and indifferent attitude of the past, so that the qestion of racing control may find its satisfactory solution under the arrangement effected. To this end, the manufacturers and importers declare themselves as pledged to give every aid, so that with a strengthened hand the A. A. A. can fulfill its proper function as the supreme race governing body.

More Money for the Motor Parkway.

Financial affairs of the Long Island Motor Parkway have been bobbing into prominence for the last few weeks through the fact that it became known that the enterprise was greatly in need of further funds to carry on the work of construction. The original bond subscription of $500,000 appears to have been eaten up already in the construction of the nine miles actually built out of the total of 40 miles which the scheme contemplates, and in laying out of parking spaces in connection with the racing events so far held. Rumors that the project was to be abandoned as a failure were set at rest late last week, however, by the announcement that J. Pierpont Morgan, W. K. Vanderbilt, Sr., and H. B. Hollins had subscribed for $1,000,000 more of bonds, thus figuratively putting it on its feet again, so that the work of completing the Parkway will commence in the spring.

Hartford Plans a Four-Ply Run.

At the regular monthly meeting of the Automobile Club of Hartford, held last week, the report of the contest committee providing for a 200 miles endurance contest to be held on May 22 was accepted. The plan adopted calls for a run over four different routes of approximately 50 miles each, radiating from Hartford, where will be the only point of control; and a time schedule allowing for a speed of not more than 20 miles per hour. Penalties, exclusive of tire troubles, are to be assessed for each minute lost in making repairs, at the rate of one point per minute; and all stops to be added to schedule time. Any "obvious" breakages or deformation of springs, spring hangers, frames, axles, pivots, wheels or parts thereof, are to be penalized.

Working up a Climbfest for Chattanooga.

Encouraged by the interest aroused in the forthcoming Mardi Gras meet at New Orleans, in which he has a hand, the well-remembered W. A. Pickens is active in the promotion of a three days hill climb and race meet to be held at Chattanooga, Tenn., March 16, 17 and 18. The program includes a hill climb on Lookout Mountain for the first day, followed by a two days meet on the Olympic track. A match race between Lewis Strang and De Palma, "the great French driver," figures conspicuously in the preliminary announcements.

REVISING BAY STATE STATUTES

Highway Commission Reports on Codification—It Prefers a Uniform New England Law Which It Submits.

One of the busiest committees of the Massachusetts legislature at the present time is that on roads and bridges, to which is referred all proposed legislation affecting motor vehicles. The grist falling into the legislative hopper this session is quite as voluminous as during previous sessions, and the committee has given several important hearings. It now has to take up and consider the report of the State highway commission, made in accordance with the resolve passed last year directing the codification of the motor vehicle laws of the State. This report is a printed document of 56 pages, including not only the codified laws of the State with the Commission's report thereon, but also the proposed uniform motor vehicle law for New England, which was drafted as a result of the conference of New England governors in Boston last fall. The Commission recommends that the uniform law be adopted in place of the codification of the existing laws.

The codified law consists of 32 sections and includes not alone the existing statutes, but rules which the Highway Commission has made under authority of statute, likewise some new provisions, which in the opinion of the Commission are desirable. Following are some of the most important features:

Section 2 has to do with registration and a new clause gives the Highway Commission power to refuse to register a vehicle which it considers unsafe or improperly equipped, and for the same cause it may revoke registrations. Section 5 is entirely new and relates to the display of number plates, which must be placed so as always to be visible, in a horizontal position with the bottom not less than 15 and not more than 36 inches from the ground. The rear plate must be illuminated at night so that it can be seen at a distance of 60 feet.

Under section 7 the Commission has incorporated a new provision requiring that every motor vehicle of more than 10 horsepower shall have at least two powerful and separate brakes, one of which must act on the rear wheels. One must be a foot brake. Sections 9 to 15 have to do with the operation of motor vehicles. A chauffeur teaching an unregistered person is made liable for an infraction of the law by that person. The time for lighting up is changed from an hour to a half hour before sunrise and after sunset. Rear lights must show red and also white to illuminate the number plate. When left unattended the motor must be stopped and upon approaching a curve or intersecting way the driver is required to slow down and give a signal with his horn or other device. There is also included a clause requiring drivers to turn square corners.

The speed limits remain the same, but the law relating to local regulations is so changed as to prevent the exclusion of motor vehicles from State highways and other main roads. By section 28 the Commission's rule, somewhat amended, requiring the keeping by dealers and manufacturers of a record of the cars entering and leaving their garage is extended to all garages, thus covering private cars kept in public garages.

The most striking difference between the codified and the uniform law is in the matter of registration and fees. Under the uniform law there is arranged a system of graded fees based on horsepower, which is to be determined by the commission. The fees run from $5 for a car under 10 horsepower, and the charges for a dealer's or manufacturer's registration is made $50. For the registration of a non-resident's car during the summer months, or of any car between October 1st and the end of the year, a half rate fee is proposed. Another important change incorporated in the uniform law is the increase of the speed limit from 20 to 25 miles outside the thickly settled sections. Driving faster than the limit is made conclusive instead of prima facie evidence of an infraction of the law.

The system of penalties for speed violations is made more severe. For conviction of a second offense of driving while under the influence of intoxicating liquor, the punishment is made imprisonment for from six months to two years. Racing on the highways is made an offense punishable the same as reckless driving. This includes driving for a record. The uniform law would do away with all local speed regulations except those of the Metropolitan Park Commission and of the town of Nantucket.

Under the uniform law a person who has a regular residence or place of business in the State for three months in a year is considered a resident. Non-residents may use their cars in the State for ten instead of seven days and may take out three months' registrations, covering July, August and September. On the matter of determining the horsepower the bill reads: "The horsepower of every motor vehicle sought to be registered shall be determined by the commission, and such determination shall be final and conclusive."

French Tax Rating Unsatisfactory.

Much dissatisfaction is being manifested among owners and manufacturers in France over the new system of basing automobile taxation on the highest rating of cars. In the past, for example, a 20-30 horsepower car was taxed on a medium rating of 25 horsepower, and this basis was considered equal to all, but now the rate has been raised and in the future car owners will be taxed at the highest power value assigned their machines.

JOY RIDES FREE FOR EVERYBODY

Motoring Carnival to Mark the Opening of New York's Newest Bridge—Unusual Treat Planned for the Public.

Plans maturing for the opening of the Queensborough bridge on June 12 include a great motoring carnival to continue through the week, and which, the celebration committee expects, will enable "everybody and his wife or sweetheart" to enjoy a free automobile ride over the bridge and back. For the opening day the committee anticipates having more than 5,000 automobiles at command for this purpose, and they will be dispatched over the bridge under a two minutes headway during the day. It is believed to be vary probable that many of the real estate concerns engaged in developing home sites on Long Island will improve the opportunity to give prospective purchasers a taste of touring over the charming roads to which the big bridge will afford an approach from Manhattan, and the continual strengthening of this probability is one of the reasons for spreading the celebration over the entire week. The committee reckons also upon a big participation by automobile makers and dealers who will regard the occasion as affording especially favorable opportunity for demonstrating their machines. This expectation is reasonable in view of the fact that the great cantilever structure stretching across the East River between Manhattan and Long Island, with its central supports on Blackwell's Island, is the first big bridge in the world upon which special provision has been made for automobile traffic.

Arrangements for the carnival have been placed by the celebration committee in the hands of a special committee, the chairmanship of which has been accepted by A. R. Pardington, vice-president and general manager of the Long Island Motor Parkway. The vehicles crossing the bridge on the opening day will be under the control of the celebration committee and each will carry a sign indicating that it is free to any one who desires to take the ride. No person operating a machine on the bridge that day will be permitted to charge any fare.

In order to accommodate the operators of automobiles all conveniences will be provided free of charge, including gasolene, the making of repairs and the hospitalities of the garage. Small cards giving the various points at which these conveniences will be afforded will be given to all chauffeurs. Guide books telling of the principal points of Long Island and the best roads will be furnished all automobile owners on application to the automobile committee of the celebration committee. That many thousands of people will indulge in this unusual opportunity for an outing is a very safe prediction.

AMONG CLUBS AND ASSOCIATIONS

Jersey Motorists to Confer on Laws—Support for Federal Legislation Invited—News of Club Elections.

An important gathering of New Jersey motorists is planned for Thursday evening, 25th inst., in connection with what is to be known as "Club Night" at the Newark automobile show. Secretary H. A. Bonnell, of the Associated Automobile Clubs of New Jersey, has sent out a call for a general meeting of all motorists holding membership in the various automobile clubs affiliated with the association, to be held in the Essex Troop armory. Secretary A. B. Le Massena, of the New Jersey Automobile and Motor Club, also has notified the 1,400 members of that Newark organization, and expects a big attendance from among the number.

The meeting is called in order that the representatives of the different clubs throughout the State may have opportunity to discuss in open session the different phases of the motor vehicle law and to suggest amendments to the present act that may be deemed advisable to the motoring fraternity.

It is expected that a large and representative gathering of club members will take part in the deliberations, as hundreds of automobilists have planned to visit the show on that evening. As the session will be held in the executive offices adjoining the exhibition hall, it will be convenient for the show visitors to attend.

At the regular monthly meeting which was held at the Auditorium Annex in Chicago last week, the executive committee of the American Automobile Association unanimously adopted the recommendations contained in a communication from Chairman Terry, of the legislative board requesting the support of the allied motor clubs in pushing the federal registration bill through Congress.

The bill provides that a motorist residing in any State upon filing with the proper bureau at Washington a statement that he has complied with the provisions of the law of the State of his residence, accompanying the same with a fee of $5, will be entitled to a United States number, which will be shown on his car when traveling from state to state, and will not be obliged to take out registration or pay any license fees in any state through which he may desire to pass.

Owing to internal dissensions within the ranks of the Bay State Automobile Association of Boston, several of its active members have withdrawn and formed a new organization, to be called the Boston Motor Club. R. R. Ross and A. E. Adams, who are the prime movers in the new club, have met with good success in their efforts to develop interest in the project, and the new club will start with over 200 members. A committee from the Bay State A. A. addressed a meeting of the members of the new organization, requesting them to reconsider their action and return to the fold, but it was decided to go ahead with the new club. At a temporary meeting held last week, committees were appointed to draft a constitution and by-laws, and secure quarters for the infant body. In answer to the question as to whether there is room for still another organization of the kind in Boston, the founders of the new club state that it is not in any way intended to antagonize the Bay State Club, but to strive to make the new club a social center for the motoring fraternity.

New life was instilled into the Illinois State Automobile Association, which had fallen into a state of lethargy at a mass meeting of the members held in Chicago last week. L. E. Myers, of Chicago, was placed in the chair and a vigorous campaign will be instituted to secure favorable legislation for motorists, co-operation in the work of state roads improvement, the erection of sign boards, the securing of discounts on motor car supplies for members, and in agitating the subject of uniform state laws in the middle West. The election of officers resulted as follows:L. E. Myers, Chicago, president; George W. Ehrhart, Decatur, first vice-president; P. A. Whitney, Peoria, second vice-president; E. W. McCready, Chicago, third vice-president; F. H. Trego, Chicago, secretary; John Farson, Chicago, treasurer.

At its recent annual meeting the Quaker City Motor Club elected a new set of officers and board of governors. Unusual interest centered in the fight for president and board of governors, and after a spirited contest, L. D. Berger was elected president The other officers chosen were M. E. Brigham, first vice-president; G. D. Bartlett, second vice-president; H. C. Harback, secretary; G. T. Stewart, treasurer. Board of governors, F. G. Dunlop, R. E. Ross, G. H. Gantert, J. R. Overpeck, W. J. Donnelly, E. H. Lewis, Richard Sellers, A. T. James and Max R. Greene.

At its annual meeting last week the Motor Club of Harrisburg, Pa., elected the following officers for the coming year: O. C. Robertson, president; C. C. Cumbler, first vice-president; F. J. Brady, second vice-president; A. G. Forster, third vice-president; J. C. Myton, secretary; J. C. Nissby, treasurer. Members elected to the board of governors were: W. O. Hickok, to serve two years; F. A. Stees, C. C. Cochlin and J. S. Sible, for three years.

After a not very successful existence the California Women's Automobile Club, which has its headquarters in San Francisco, has passed into the "great beyond." Last week the club closed its affairs, but the members immediately formed another organization, to be known as the Pacific Coast Motor Club. It was stated that the old name had been a hindrance to the advancement of the club. The officers of the new organization are: President, Mrs. J. W. Leavitt; vice-president, Mrs. J. C. Perry; secretary-treasurer, Mrs. J. H. Healy.

Motorists of Marshalltown, Iowa, having decided that an organization was needed to properly take care of their interests, last week formed the Marshalltown Automobile Club, with a charter membership of 25. At the election of officers the following were chosen to preside over the club's affairs: James L. Denmead, president; Charles C. Eldridge, first vice-president; A. J. Clark, second vice-president; Merritt Greene, Jr., secretary; H. K. Denmead, treasurer.

Brimfield (Ill.) motorists recently formed the Brimfield Automobile Club. After adopting a constitution and by-laws, the following officers were chosen: Dr. A. A. Knapp, president; E. M. Maher, vice-president; A. Mainville, secretary-treasurer. The club was launched with a membership of twelve, with bright prospects of a substantial increase.

At its annual meeting last week the Oneida (N. Y.) Automobile Club elected the following officers: John Maxwell, president; H. M. Reynolds, vice-president; Frank W. Farnam, secretary; Fremont Chapin, treasurer. After disposing of this important matter a constitution and by-laws were adopted and a good roads committee appointed.

At its recent annual meeting, the Automobile Club of Parkersburg, W. Va., elected the following officers for the coming year: W. T. Carter, president; C. L. Muhleman, vice-president; Joseph Russell, secretary and treasurer. Three members chosen for the board of directors were: W. S. Smith, Sherman Dils and O. S. Hawkins.

The destinies of the Rhode Island Automobile club for the coming year will be in the hands of the following officers, who were elected at the recent annual meeting: H. R. Nightingale, president; C. A. Russell, vice-president; F. M. Barber, secretary; E. E. Boyden and E. F. Crowell, members of the board of governors for three years.

At Columbus, O., on February 15, the Columbus Automobile Club took formal possession of their new club house, said to be one of the finest in the Middle West. Open house was held, and tradesmen, members and their friends took occasion to inspect the new quarters and participate in the house warming ceremonies.

The Week's Patents.

901,767. Brace for Supplementary Vehicle Springs. William Young, St. Louis, Mo., assignor to Supplementary Spiral Spring Company, St. Louis, Mo., a Corporation of Missouri. Filed Nov. 24, 1905. Serial No. 288,899.

1. A rigid brace for a supplementary vehicle spring composed of a pair of arms and a pair of cross-pieces connecting same, said cross-pieces containing openings by which said brace is attached to the device to be braced, the opening in one of said cross-pieces being in a different vertical plane from the opening in the other.

901,826. Differential Gear for Motor Vehicles. Charles J. Pittman, Redfern, near Sydney, New South Wales, Australia, assignor of one-half to Frank Ireland, Sydney, New South Wales, Australia. Filed May 11, 1908. Serial No. 432,186.

1. A differential gear for vehicles comprising a driving shaft, an arm fixed to turn therewith, a part loosely balanced on said shaft, a notched wheel also loosely mounted on said shaft, and a pawl pivotally mounted on said arm and fulcrumed on said part, said pawl having an arm adapted to be engaged relatively to the notched wheel by a relative rotation of said arm and part.

901,842. Detachable Shoe for Self-Propelled Vehicle Wheels. William P. Shattuck, Minneapolis, Minn., assignor of one-half to M. McVoy, Jr., New York, N. Y. Filed April 22, 1907. Serial No. 369,674.

1. The combination, with a wheel and its tire, of a flexible shoe and means for securing it to the tire, metallic plates secured to said shoe on each side of the center line of the tread of the tire, said shoe being adapted to yield between said plates and allow them to conform to the compression of the tire, and propelling blades mounted on said plates and adapted to engage the soil as the wheel revolves, and pack it ahead of them on each side of the wheel, for the purpose specified.

901,898. Steering Mechanism for Self-Propelled Vehicles. Charles B. Hatfield, Cortland, N. Y., assignor to Hatfield Motor Vehicle Company, Cortland, N. Y., a Corporation of New York. Original application filed Jan. 26, 1907. Serial No. 354,308. Divided and this application filed April 24, 1907. Srial No. 370,027.

1. A steering mechanism for self-propelled vericles in combination with a steering axle, a segmental guide secured to the axle, said guide constituting a fifth wheel section, a bearing for said segmental guide, a chain passed around the guide and connected to the axle, a steering post and means on the steering post for engaging and actuating the chain.

901,907. Wheel. Arthur L. Jiminez, New York, N. Y., assignor of forty-five one-hundredths to Joseph Lopez Jiminez, and one-twentieth to Juan M. Rigau Carrera, New York, N. Y. Filed July 1, 1907 Serial No. 381,689.

1. A wheel comprising a sheet metal body portion and a tire portion, said body portion comprising two plates secured together and each provided with a peripheral bead, the peripheral beads of the respective sheet metal body members co-operating to form a hollow rim disposed within the tire portion and a pneumatic tube within the tire portion and constituting a bearing for the hollow rim formed by the peripheral heads on the plates of the body portion.

901,921. Automobile Lamp. John Markman, Pittsburg, Pa. Filed April 30, 1908. Serial No. 430,161.

In a device of the type described, a lamp box comprising a base and side walls secured thereto, guides carried by said side walls adjacent the upper and lower edges thereof, reflectors secured in said guides, braces connecting said side walls at the ends thereof, a transparent plate seated in the brace at the forward end of said box and in the said base, a sign-plate secured over said transparent plate, a perforated metallic top-plate for said box, hinged door for the rear end of said box, and a reflector carried by the inner face of said door.

902,015. Tire Protective Rivet. Edwin B. Stimpson, Brooklyn, N. Y., assignor to Edwin B. Stimpson Company, a Corporation of New York. Filed Jan. 30, 1908. Serial No. 413,373.

1. A protective rivet, comprising a base member having a hole through it, a shank member projecting from said hole having a headed portion too large to pass therethrough, a ring-like member secured on the base member by infolding the latter against it and having the walls of its ring opening in an engagement with the shank head adapted to prevent movement of said shank head away from the base member, said ring member being recessed on its outer face to have ring-like road contacting walls, one within the other and separated by a space.

902,045. Differential Mechanism. Emile Aze, Minneapolis, Minn., assignor of one-half to Hans Bjelland, Minneapolis, Minn. Filed May 15, 1908. Serial No. 432,980.

1. A differential mechanism comprising a gear wheel, a casing secured thereto and having hubs, axles journaled in said hubs and having eccentrics on their inner ends, a primary cross head having a guideway in said gear, secondary cross heads having guideways in said primary cross heads and movable in a direction substantially at right angles to the direction of movement of said primary cross head, said secondary cross heads having openings to receive said eccentrics, and means whereby the movement of one secondary cross head will be transmitted to the other one.

902,072. Wheel. Richard K. Gregory, Greensboro, N. C. Filed March 16, 1907. Serial No. 362,706.

In a vehicle wheel, the combination with a channeled rim and its support, and a circumferentially extending series of shoes movable within said rim and spring pressed outwardly and formed with transversely enlarged inner ends producing outwardly facing shoulders, the rim being formed with coacting shoulders to limit the outward movement of the shoes, the sides of said enlargement being formed with sockets, each shoe being formed at one end with spaced sockets in line with the sockets of the enlargements and between said end sockets with a groove, each being formed at its opposite end with a tongue of less width than the shoe and in alignment with the side enlargements, said tongue being adapted to fit in the groove of the next adjoining shoe, anti-friction devices mounted in the sockets of the side enlargements of the respective shoes and bearing against the sides of the rim, and other anti-friction devices in the end sockets at opposite sides of the grooves, said last named anti-friction devices bearing against the end of the respective adjacent shoes.

902,117. Automatic Headlight Deflecting Mechanism. Joseph J. Shipley, Washington, D. C. Filed May 17, 1906. Serial No. 317,370.

1. In a motor vehicle, a spring supported body, steering knuckles, duplicate lamps rotatably supported from said body, a connection between the lamps whereby they may be moved in unison, means connecting one of the steering knuckles with one of the lamps, and means connecting the other steering knuckle with the other lamp, whereby both of the said lamps may be rotated to project the light in the path of travel of the vehicle when turning corners or rounding curves.

902,147. Tire. Edwin T. Greenfield, Kiamesha, N. Y. Filed Oct. 30, 1906. Serial No. 341,255.

In a tire, the combination of a resilient tube, an armoring therefor consisting of sheet metal of U shape cross section partially inclosing the tube and so formed as to provide spaces between the tube and armoring having openings in the face thereof, and projections supported on the tube and extending through the openings in the armoring, said projections being provided with means for preventing them from passing through said openings, substantially as set forth.

902,149. Driving Mechanism for Motor Driven Vehicles. Hans T. Hansen, Milwaukee, Wis., assignor, by mesne assignments, to T. D. Lovering, St. Paul, Minn. Filed May 29, 1905. Serial No. 262,760.

1. In a motor driven vehicle, the combination of a motor mounted on a yielding frame, and connected to drive the four wheels through rotary axle shafts—said connections comprising a flexible motor shaft, and a set of transmission shafts connected therewith by differential gearing, and operatively connected to drive the respective axle shafts, one of the transmission shafts being flexibly jointed between said differential gearing and the axle shaft, and supported at the joint from the yielding frame.

902,212. Sectional Tire. Horace O. Craven, Schenectady, N. Y. Filed Nov. 11, 1905. Serial No. 286,794.

1. In a tire section, two end supports of metal constructed to be attached to a wheel, a layer of textile material extending between said supports and connected thereto and an outer sheathing of elastic material covering said textile material and receiving said supports.

The Warner Auto-Meter

1909 Style

Guaranteed Absolutely Accurate

is the only speed indicator made on the Magnetic Induction principle. Because of the principle it accurately indicates every range of speed from zero to the maximum.

All other instruments are made on the centrifugal principle. They fail to indicate any speed whatever under 5 to 10 miles per hour.

The Auto-Meter is so durably made that practical tests have shown that it will endure a **MILLION MILES** of riding without perceptible wear, or departing from absolute accuracy more than 10 feet to the mile.

We invite comparative tests. Before you decide on any Speed Indicator, put the Auto-Meter on one side of your dash and any other indicator at any price on the other. Then use your watch over a measured course. Keep the instrument which **tells** the **truth.** We know which it will be.

"THE SILENT SELDEN"

$2,000 F. O. B. ROCHESTER, N. Y.

AFTER the remarkable results of our "first year"—the achieved success of 1908, we salute you with real and well established confidence as we introduce the Selden of 1909.

Not only has our promise to produce a high grade car of best materials and workmanship for $2000 been strictly fulfilled, but we have demonstrated the Selden genius in a silent, strong, comfortable, durable and handsome car. It does all that the owner wants to do and all that the chaffeur ought to do. Agents and owners are enthusiastic over it. Not a cheap car at all but one of the how-can-you-do-it-for-the-money kind.

Our 1909 wheel base is lengthened 5 inches from 109 to 114; the magneto and pump moved to left side of motor, the remaining equipment on the right; the brakes enlarged and now rigged inside the frame; the wheels now 34 inches were 32 inches; the radiator and hood made to conform in style to longer wheel base—little touches for style and convenience. No radical mechanical changes, simply because we couldn't find any necessary—no use fooling with what has proved so unusually good.

We can assure those who buy the 1909 Seldens all the efficiency of the 1908 Seldens with a little more style and a little more convenience, a little more refinement. The actual records of use and travel this year have so proven their merit, power and economic stability that it would be hard to promise anything better in practical construction.

OVER IN ENGLAND

they know that

MORGAN & WRIGHT TIRES

are good tires.

W. A. Cloud, of London, writes, under date of January 29th:

We have pleasure in stating that we have a car fitted with your tyres, which has been running successfully since May last. This car has covered up to date 12,000 miles, and about 7,000 miles were covered on your tyres, and although the treads are badly cut up, we have had the tyres re-treaded with anti-skidding bands, and the tyres are now as good as ever. We consider the rubber used in these tyres to be the finest we have come across.

We are, Dear Sirs, yours faithfully,
W. A. CLOUD.

Which only goes to prove that the world over *"there is no method of making friends equal to the method of making good."*

MORGAN & WRIGHT TIRES will "make friends" and "keep friends" with you if you specify them on your car.

MORGAN & WRIGHT, Detroit

The Overland is no experiment. It has established a reputation the equal of any car at any price.

The extraordinary simplicity of its design, coupled with the quality of material and workmanship employed, make it absolutely fool-proof.

A child can learn to drive it in ten minutes.

The most exacting driver can get all the speed, all the power, all the service, and all the pleasure that he desires from it.

It is everybody's car, and does not belie its name.

MILLER'S

Anti-Freeze Compound

DIRECTIONS FOR USE.

The radiator should be thoroughly washed out with hot solution of caustic soda, which will remove any dirt, and then clean water should be put in to see if the radiator leaks any place.

If the radiator is found not to leak, put in the solution. To get a mixture that will not freeze at 15 degrees below zero, Fahrenheit, add ten pounds of the compound to two gallons of water. To get a solution that will not freeze 30 degrees below zero, Fahrenheit, add ten pounds of the compound to every six quarts of water.

The cover on the can should be kept closed tight at all times while it contains any of the compound.

Price, 10-lb. cans..... $1.00 each.

Pan-American Automobile Body Polish

Pan-American Polish was awarded the Bronze Medal ("the only one awarded") at the Louisiana Purchase Exposition at St. Louis, 1904. This polish has been carefully prepared for the Automobile trade. It is also applicable to the carriage trade, or can be used on any varnished furniture or wood-work of any kind. It will remove stains, cover scratches; leaves the automobile with its original new lustre without being sticky or greasy.

It can be used on the leather seats or tops with the very best results. Can be used on any color or kind of varnish from the clearest white to the darkest black. Furnished in eight-ounce bottles.

For sale by all automobile dealers.

Price, 60 cents per 8-oz. bottle. Price, $3.00 per gallon.

Special prices quoted manufacturers, jobbers and dealers. Catalog on request.

THE MARMON

"A Mechanical Masterpiece"

Service. Not Sensation

There is but one way to attain the durability and constant reliability which are the very foundation of motor car value.

Fifty years of experience in manufacturing the highest grade of machinery have taught us the necessity of designing and manufacturing from the ground up.

It is this thoroughness of construction which has given the Marmon its fame for mechanical excellence, ideal service and length of life.

With all doubt about these vital attributes eliminated, the Marmon "Thirty-two" presents a notable value to the buyer who looks ahead.

Motor, 4 Cyl. 4½x4½. Water-cooled. 32-40 H. P. Three-point support. Ignition, Bosch H. T. Magneto, dual system. Lubrication, Marmon system of automatic force feed through hollow crankshaft. Drive, straight line shaft. Selective transmission and rear axle one compact unit, very accessible. Large brakes, effective and very durable. Materials, absolutely the best of everything, including Krupp and Chrome Nickel Steels. Hess-Bright imported ball bearings. Tires, Q. D.,34x4. Wheel base, 112 in. Weight, 2100 lbs. Equipment, complete and high-class. Bodies, Sheet Metal. Touring Car seats five; Suburban (detachable tonneau) seats four; Roadster seats two. Also Coupe or Limousine Town Car.

Marmon "Fifty" (Seven Passengers), $3,750.

Rambler

The Car with the Offset Crank-Shaft

Model Forty-four, 34 H. P. $2,250.

Spare Wheel, with Inflated Tire, Brackets, and Tools, $74. Magneto, $150.

The Rambler Spare Wheel

Have you ever had to stop on the road to repair a punctured tire when you were in a hurry to reach your destination?

All 1909 four-cylinder Ramblers are fitted for the Rambler Spare Wheel, a wheel complete, excepting hub center, with an inflated tire. Can be substituted for front or rear wheels within three minutes' time. Only six nuts to remove—done quickly with special tools provided.

Completely obviates all tire worries; makes punctures mere incidents of a trip and saves the tiresome task of pumping up the new tire. The price of the Rambler Spare Wheel complete is $74 or $85, according to tire size.

Write for catalog describing in detail Rambler offset crank-shaft, straight-line drive, and other exclusive Rambler features.

THE MOTOR WORLD

Volume XIX. New York, U. S. A., Thursday, February 25, 1909. No. 22

RECEIVERSHIP FOR OSCAR LEAR

Petition is Filed by a Stockholder—Assets are Said Greatly to Exceed the Liabilities.

A receiver has been appointed for the Oscar Lear Automobile Co., of Springfield, O., in accordance with a petition filed on the 18th inst., by Harry C. Downey, a stockholder, on behalf of the other stockholders. The action is stated to be the result of the failure of the company in its efforts to increase its operating capital to a point commensurate with its business. The total indebtedness of the concern is given as $144,140, while the assets are estimated at $308,000. The company moved from Columbus, O., to Springfield in the summer of 1907, and was then reorganized with $300,000 capital stock. In addition to producing Frayer-Miller automobiles it has latterly devoted considerable attention to commercial vehicles, a field in which it has met with considerable success.

"We have been realizing for some time," said Oscar Lear, in connection with the receivership proceedings, "that the capital of our company was inadequate, and owing to some pressing claims we have found it necessary to ask the protection of the court, feeling confident that this would be merely a temporary measure, and that in this way the additional capital needed might be secured under advantageous terms."

Grossman Heads a New Company.

Emil Grossman, prominent in the trade through his interests in the National Sales Corporation and the Motor Car Equipment Co., of New York City, has organized a new corporation, capitalized at $100,000, to be known as the Emil Grossman Co., of which he will be the president. The company's chief products for the immediate future will be wind shields and spark plugs, the latter being made in both the porcelain and mica types. In connection with the wind shields a new hydraulic controlling device will be disclosed, arranged to prevent the folding section of the shields from dropping too suddenly if accidentally released when being turned down, although the company will also make a model with spiral spring control.

American Distributing Moves.

The American Distributing Co. moves on March 1st from Cleveland, O., to 207 West South street, Indianapolis, Ind. It will act as exclusive sales managers for the following concerns: The Westinghouse Electric & Mfg. Co., Pittsburg, Pa.; The Hayes Wheel Co., Jackson, Mich.; The Lewis Spring & Axle Co., Jackson, Mich.; The Jackson Drop Forging Co., Jackson, Mich.; The American Gear & Mfg. Co., Indianapolis, Ind.; The Elyria Machine Parts Co., Elyria, O.; The Kinsler-Bennett Co., Hartford, Conn.; and the Sparks-Withington Co., Jackson, Mich.

Pneu L'Electric Alleged Insolvent.

A petition in bankruptcy was filed Wednesday, 24th inst., against the Pneu L'Electric Co., which has been making carburetters at 238 West 108th street and selling tires and carburetters at 1610 Broadway, New York City. The petitioning creditors lent money to the concern and now declare it to be insolvent.

Kirk Joins Forces with Houpt.

The W. S. Reed Co. has been organized in Massillon, O., for the manufacture of automobiles. The machines as planned are to be six cylinder roadsters of high power, and a demonstrating model is being completed in a temporary shop in West Tremont street.

Reed to Make Roadsters.

Ezra E. Kirk, of Toledo, O., who has been conspicuously identified with the automobile industry almost from the start, has become financially interested with Harry S. Houpt and will become the western sales manager for the Herreshoff and Houpt cars. His headquarters will be in Detroit, Mich.

ARNSTEIN DECLARED BANKRUPT

Chicago Jobber Put into Receiver's Hands by Trade Creditors—A Veteran in the Field.

Involuntary bankruptcy proceedings have been brought against Eugene Arnstein, one of Chicago's oldest and best known jobbers in motor car supplies, and, as a result, the business has been placed in the hands of a receiver. The petition was filed on the 18th inst., by William A. Rogan, acting as attorney for a group of unsecured trade creditors, whose claims are stated to aggregate in the neighborhood of $40,000.

Following the filing of the petition, the American Trust & Savings Bank, of Chicago, was appointed by the court to act in the capacity of receiver, and it was at once put in custody of all the assets. No estimates are offered as yet either as to the total of the liabilities or of the assets, but the work of taking an inventory has already been begun with a view to making early schedules of both.

Because Arnstein is a recognized veteran among the wholesalers, the failure comes as a surprise to those of the trade not intimately in touch with the trend of the jobber's financial affairs. For many years devoted to the jobbing of bicycle goods and enjoying a wide patronage, the business added automobile accessories and supplies to its lines when the use of motor cars developed this field, and while not as conspicuous in trade activities as in former years, was regarded as substantial.

Homer the Home of the Homer.

Homer, Mich., is to have a motor car factory, the Homer Auto Truck Co. having been formed to manufacture automobile trucks, drays, delivery wagons and pleasure vehicles. The principal stockholders include Earl J. Fellows, C. L. Lenn, W. H. Courtright, Frank Mount and Charles R. Church.

In the Retail World.

Harry H. Mundy has been appointed Buick manager at Utica, N. Y. The offices and salesroom of the Utica branch are at 231 Genesee street.

Frank L. Apgar, for some years connected with the Motor Car Co. of New Jersey, has become New Jersey State manager for Fiat cars. He will shortly establish headquarters in Newark.

The Ford Sales Co. has prepared for business in Utica, N. Y. Its new salesroom was opened this week at 65-67 Columbia street, in the big double store of the Blasier building.

The Samoset Garage & Transportation Co. has been organized in Plymouth, Mass., and will shortly open a salesroom and garage. Eugene H. Dorr is president and James W. Cooper, treasurer.

The Countryman Automobile Co. is a new sales organization in Minneapolis, Minn., and it will handle the Halladay line. A location has been taken at 108 Tenth street, S., in the Paulman motor buildings.

At Spirit Lake, Iowa, a partnership for the automobile business has been formed by Adrian Hurd and John W. Hartman. They will have a garage on the lot east of the Hotel Milo, and will handle Reo cars.

Frank S. Corlew and H. C. Kilbourne have formed the Kilbourne-Corlew Motor Co., to handle the Velie in Boston and elsewhere in New England. The headquarters of the company will be at 26-28 Bowker street.

F. Shirley Boyd, New England representative for supplementary spiral springs, and H. T. Brown, agent for Dow tires and tubes, have changed their location in Boston, Mass. They have moved from 880 Boylston street to a new store at 893 Boylston street.

The Metropolitan Garage, at Seventy-seventh street and Broadway, New York City, was purchased on February first by the Monarch Motor Co., which will operate it as a high class storage establishment. It is announced that the garage will be made one of the largest and finest in Manhattan.

The Stoughton-Folkins Co. have opened a garage in Portland, Me., occupying the ground floor of a large building on Oak street, long noted as a big stable. It has been provided with a concrete floor and has been remodeled completely, now containing a fine show room, office, lounging room for chauffeurs and other convenient apartments. A repair shop has been fitted up in a thorough style. The firm will handle the Maxwell.

Harold Brinker, one of Denver's daring road drivers, has decided to cash in one some of his fame by going into the automobile business for himself. In partnership with B. G. Vreeland he has formed the Brinker-Vreeland Automobile Co., which will have its readquarters in the front part of the ground floor of the Denver Omnibus and Cab Co.'s big garage at 1627 Court place, where Matheson, Moon and Rauch & Lang cars will be handled.

In order to meet the growth of its business in Boston, the Goodyear Tire & Rubber Co. has secured for its own exclusive occupancy the five story building at 669 Boylston street. It has a ground area of 24x90 feet, and is to be remodeled from the basement up, the new conveniences including electric elevators. The salesrooms and general offices will be made very attractive. On the completion of the alterations, about May 1, the Boston branch will be transferred from its present location at 261 Dartmouth street. William T. Teagan is the company's local manager.

Death of Rossell Drisko.

Rossell Drisko, manager of the Boston branch of the Jones Speedometer, died at his home in Jamaica Plain, Mass., on the 17th inst. His death is ascribed to a severe cold said to have been contracted during the Madison Square Garden automobile show in New York, which in connection with heart trouble, induced fatal complications. He was 28 years old and had been prominent in Boston automobile circles for several years. A widow survives him.

Bassette Resigns from Corbin.

Buel B. Bassette is announced as having tendered his resignation as secretary of the Corbin Motor Vehicle Corporation, of New Britain, Conn., and further changes in the company's organization are intimated. His resignation takes effect in March, when he will become connected with another manufacturing concern.

Stewart Speedometer in Detroit.

C. E. Brelsford has been appointed manager at Detroit, Mich., for the Stewart & Clark Mfg. Co., of Chicago, Ill. An office has been opened at 697 Woodward avenue, from which the local trade and all the automobile manufacturers in Michigan will be supplied with the Stewart speedometers and specialties.

Ford Gives Harper New Duties.

H. B. Harper, advertising manager of the Ford Motor Co., Detroit, Mich., has assumed new duties. He is now assistant commercial manager of the company, working in conjunction with Commercial Manager Hawkins.

Hopkins Goes to the Centaur.

L. A. Hopkins, formerly sales manager of the St. Louis Car Co., at New York City, has become the sales manager of the Centaur Motor Co., of Buffalo, N. Y. He will have his headquarters in the latter city.

Clinton and Bergdoll in New Positions.

Harry T. Clinton has been made manager of the Chicago branch of the Fiat Import Co. In leaving Philadelphia he has placed the Fiat agency with Louis J. Bergdoll.

The Week's Incorporations.

Chicago, Ill.—Emery Motor Livery Co., under Illinois laws, with $50,000 capital. Corporators—W. W. Dixon, A. Lindhelm and W. S. Jameson.

Detroit, Mich.—Taxicab Co., The, under Michigan laws, with $5,000 capital. Corporators—Frank E. Robson, Irwin S. Scrimger and Ransom G. George.

Greeley, Colo.—Greeley Automobile Co., under Colorado laws, with $10,000 capital. Corporators—L. C. Vanderlip, W. T. Lynn, W. D. Mancher and F. E. Reinks.

Salt Lake City, Utah—Oldsmobile Company of Utah, under Utah laws, with $10,000 capital. Corporators—J. H. Garrett, A. O. Treganza and Fred Strouse.

Jersey City, N. J.—Bruns, Kimball & Co., under New Jersey laws, with $35,000 capital; to deal in and repair motors, etc. Corporators—W. Bruns, C. C. Kimball and M. C. Kimball.

Cleveland, O.—Charles B. Shanks Co., under Ohio laws, with $5,000 capital; automobile agency. Corporators—R. H. Williams, C. A. Burk, L. M. Henders, J. A. Burk and C. A. Aaron.

Mineola, L. I.—Automobile Building Co., under New York laws, with $100,000 capital. Corporators—William Willett, Jr., H. H. Frost and F. E. Malone, of New York City, and Rhoda Miller, of Jamaica.

Minneapolis, Minn.—Countryman Automobile Co., The, under Minnesota laws, with $25,000 capital; to deal in motor cars. Corporators—George H. Countryman, O. W. Howe, P. O. Heide, H. N. Stabeck and F. O. Gold.

Trenton, N. J.—Mitchell Sales Co., under New Jersey laws, with $50,000 capital; to deal in and manufacture automobiles. Corporators—Frank L. C. Martin, Plainfield; Clarence B. Ackers and John W. Mosher, Trenton.

Buffalo, N. Y.—Auto-Car Manufacturing Co., under New York laws, with $250,000 capital. Corporators—John B. Pierce, Chicago, Ill.; George W. Atterbury, George D. Pratt, Edward B. Green and George H. Frost, Buffalo, N. Y.

Suffolk, Va.—Parker Manufacturing Co., under Virginia laws, with $50,000 capital; to deal in and repair automobiles. Corporators—B. E. Parker, president, Franklin, Va.; J. W. Weitzell, secretary, Richmond; G. W. Nurney, Suffolk.

New York City, N. Y.—Overbaugh-Martin Motor Car Co., under New York laws, with $50,000 capital; to manufacture automobiles, etc. Corporators—D. C. Overbaugh, Nyack; A. L. Martin and R. H. Overbaugh, New York City.

Cincinnati, O.—Cincinnati and Munroe Automobile Co., The, under Ohio laws, with $4,500 capital; to operate buses between Cincinnati and Munroe, O. Corporators—L. H. Bunnell, Frank Williamson, A. T. Smith, J. H. Sigg and C. M. Robinson.

BONDHOLDERS WANT E. V. CLAIMS

They Offer 25 Cents on the Dollar to Merchandise Creditors—Figures Upon Which the Offer is Based.

Merchandise creditors of the Electric Vehicle Co., of Hartford, Conn., which has for some time been in the receivers' hands, are being offered 25 cents on the dollar for their claims by the bondholders of the company, the latter presenting a showing of the concern's liabilities to indicate the advisability of acceptance. As agent for the bondholders, C. Wendell Woodward, of Philadelphia, Pa., makes the following statement:

"A careful examination of the condition of the property at the present time indicates that under foreclosure of the mortgage a sum will be realized from the sale sufficient to pay only a small part of the bond issue, and that, therefore, the bondholders will become entitled to share in the distribution of the remaining assets with the unsecured creditors. Under these circumstances if the foreclosure suit and the receivership proceed to the final decree, the net amount realized will not (probably) pay the general creditors more than 15 cents on the dollar, if so much."

In support of these conclusions, the records of the indebtedness of the company are submitted, showing that of the total bond issue of $2,250,000, the amount of bonds sold is $1,521,000 and the amount deposited as collateral is $729,000. The total merchandise claims are given as approximately $274,469.76, subject to increase with later claims that may be proved, while the outstanding obligations, including money borrowed on notes, interest on bonds, etc., is stated to be $551,928.41, making a total of $3,076,398.17, including the bond indebtedness. It is stated that the bondholders propose the suggested settlement with the merchandise creditors to avoid the loss likely to result from a forced sale of the assets.

Jeffery Plans Mammoth Factory.

So great are both the present volume of business and the prospects for the future, that Thomas B. Jeffery & Co., of Kenosha, Wis., have planned what is declared will be the largest automobile factory in the world, and contracts will shortly be let for four new factory buildings, one of which will have a greater floor space than the Chicago Coliseum. This enormous structure will be devoted to the inspection and exterior finishing department, and will measure 386 feet square. Another of the buildings will be devoted to laboratory purposes and will have an installation of the most complete available equipment for the testing of the material used in the construction of Rambler cars and for the making of analyses of metals. A new office building will be erected, while additions will also be made to the already large machine shops. The present plant of the company occupies an area approximating 600.000 square feet, and the additions, it is stated, will put it in a class by itself as to size.

Washington Cab Chauffeurs Strike.

Protesting against a change in the wage scale and the basis of payment, about 50 drivers for the Terminal Taxicab Co., of Washington, D. C., went on a strike last week, and have declared their intention of holding out until the old system is restored. The new wage system provides for 20 per cent. of the gross receipts from each taximeter cab, with a charge to the drivers for gasolene, while under the old system they received 20 cents per hour, and were supplied with fuel without charge. The men claim that the change would cut their earnings almost in half. New drivers to replace the strikers are being secured.

Dunlop Invades the Far East.

The Dunlop Tire Co. is reaching out for Oriental trade through the medium of the Dunlop Rubber Co. (Far East) Ltd. which just has been organized with £80,000 capital and which is given the right to import and manufacture tires and other goods bearing the name Dunlop, in Japan and other parts of Asia east of Burma. The parent company in England will hold £25,000 of stock in the new concern and always will have one director on its board.

Logan Creditors to Consider an Offer.

Creditors of the bankrupt Logan Construction Co., of Chillicothe, O., have been called to a general meeting on March 8, at the office of Elijah Cutright, Jr., the referee in bankruptcy, to consider whether an offer of $16,250 for the physical property of the company should be accepted by the trustee. The offer would yield less than 75 per cent. of the appraised value, but is the best that has so far been received.

First Dividend for Dolson Creditors.

Checks for a first dividend of 10 per cent. to the creditors of the bankrupt Dolson Automobile Co., of Charlotte, Mich., were mailed this week. The concern failed about a year ago, but the receivers have just succeeded in converting part of the assets into cash available for payment on the claims.

More Room for Hartford Parts.

Larger manufacturing space has been secured by the Hartford Auto Parts Co., of Hartford, Conn., made necessary by the increased demands of its business. The west wing of Colt's Patent Fire Arms factory, at 80 Huyshope avenue, has been taken and the process of removal is being effected.

Taximeter Cabs for Springfield.

Taximeter cabs are promised for Springfield, Mass. The project is backed by H. C. Spear, who has been in the automobile renting business for some time.

APPRAISAL OF IMPORTED TIRES

Must Pay Duty as Parts of Machine with Which Entered—So Federal Court of Appeals Decides.

After a bitter fight by the importers, the tires shipped with automobiles for entry into the United States again have been held to be parts of the complete machines and subject to 45 per cent. duty as "manufactures of metal," instead of the 35 per cent. assessed on rubber goods. A decision to this effect was handed down on the 18th inst., in the United States Circuit Court of Appeals, sitting in New York City, the case having come on appeal from the decision of the United States Circuit Court, which held that the automobiles and the tires when imported together are entireties.

The appeal was taken by the Auto Import Co., of New York City, but the case is of large interest as affecting most of the importers of foreign cars, who are anxious for the granting of the lower duty on the tires that come with their machines. Judges Lacombe, Ward and Noyes constituted the court, which was divided as to the decision. Judge Lacombe wrote the majority decision, which is coincided in by Justice Ward, while Judge Noyes, in a dissenting opinion, takes the view of the importers and indicates that the tires and automobiles should be classified for duty separately.

The sole question before the court was whether the tires and machines are entireties, or subject to separate duty, the automobiles at 45 per cent. as "manufactures of metal," and the tires at the appropriate rate accruing on India rubber. The majority decision holds them to be entireties, while Judge Noyes files a dissenting opinion in which he says:

"I cannot agree that rubber tires should be assessed as manufactures of metal merely because they are imported in a crate with an automobile upon the wheels of which they never have been, and it is wholly problematical whether they ever will be placed."

Panhard Becomes Its Own Landlord.

Giving evidence of its permanence in the automobile business of New York City, the Panhard & Levassor Co. has purchased outright the four-story garage building at the northwest corner of Broadway and Sixty-second street, built about four years ago and which the company has occupied under lease. The price paid is understood to be close to $300,000 cash.

Winton Sails for England.

Alexander Winton, president of the Winton Motor Carriage Co., of Cleveland, O., accompanied by Mrs. Winton, sailed from New York on the Lusitania on the 15th inst. He will make a six weeks' visit to England and Scotland.

THE SIMPLICITY OF THE
WHITE STEAM GENERATOR

THE WHITE generator may be described as the fundamental distinguishing feature of the White Steam Car. No other steam automobile, or in fact, no other steam power plant is, or ever was, provided with such a device. As there are still some people who believe that the White generator in some way resembles the ordinary boiler, we should like to state most emphatically that there is no point of resemblance between the two, except that they both perform the function of converting water into steam. The essential points of difference between the two may be summarized as follows:

1. In the White generator, the water is at the top and the steam at the bottom. In the ordinary boiler, the water is at the bottom and the steam at the top.

2. In the White generator, the relative amount of water and of steam is not at all important. In the ordinary boiler, it is necessary that the water be kept at a certain definite level.

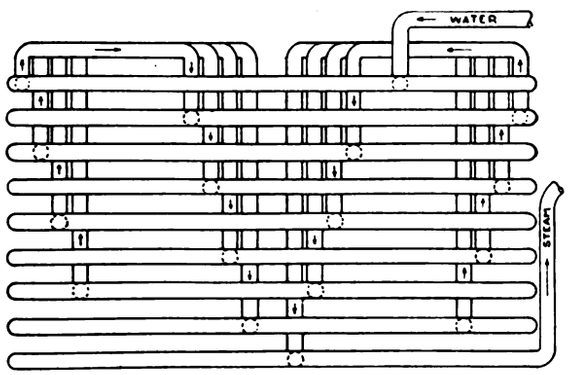

DIAGRAM SHOWING THE CIRCULATION THROUGH THE WHITE GENERATOR

THE WHITE GENERATOR

3. The White generator contains only a very little water and steam at any given time. The ordinary boiler contains great quantities of both.

4. With the White generator, a full pressure of steam may be obtained in a very few minutes. In the ordinary boiler considerable time is necessary to obtain full steam pressure.

5. The White generator has only twelve joints. The ordinary boiler has several hundred joints and the boilers in some of the early steam automobiles had several thousand joints.

6. The joints in the White generator are at the top, where they are not subjected to very much heat. In the ordinary boiler, about one-half of the joints are exposed to the hottest part of the fire.

7. The joints in the White generator are much stronger than it is possible to make them in the ordinary boiler.

8. In the White generator, the water must enter the coldest part and be forced gradually to the hottest part. In the ordinary boiler, if the water level is allowed to run low, the entering water comes into contact at once with the hottest parts of the boiler.

What "Local" Shows Accomplish.

In the rapid growth of the small shows, both as conducted privately by automobile agencies and on the club plan, as it were, by the various local organizations of manufacturers and dealers; there is food for considerable reflection and gratulation. The time is well past when one, two or even three shows of national importance could be expected to reach even a significant proportion of the masses which the show propaganda was originally intended to influence. Not even the huge and impressive bulk and glitter of the big shows can draw the actual buyer as successfully and multitudinously as a show of comparatively limited extent brought to his very door and staged in a way to suit his tastes. Furthermore, as the manufacturers are coming more and more to cater to definite classes of buyers, they are learning to concentrate their energies upon only such localities as seem likely to yield paying results. The national shows taking care of such of the agency business as is not entirely disposed of before the market of the year's product is well under way, it only remains for the maker to throw his forces into such local shows as appear to be in fertile territories.

Here, directly guided by the agents who are thoroughly familiar with local tastes and tendencies, actual results are produced which can be reckoned up in dollars and cents of good profit. Another point which argues well for the local show is the fact that being on a more or less limited scale, no such elaboration of display is necessitated as is generally called forth by the larger shows. Hence, many of the exhibits which have already done duty at New York or Chicago, for example, find their way about the country, serving their purpose for several months in succession. Whereby their value is considerably increased, and their actual cost proportionately distributed. It should be added that the amount of general publicity which is obtained for the industry at large also is considerably increased by the same means.

The Lure of Cut Prices.

To the automobile agent comes frequently the temptation of yielding to the allurements of dealers in bargains of various sorts who advertise in artful fashion either "the same thing" as standard products, or the deadly substitute, at prices so very attractive as in themselves to cause suspicion at the very outset. Most frequently the temptation assumes the form of a catalog in which are offered many of the wares that the garage and supply man may have a market for, frequently offered as new and of recent pattern, and always represented as being equal to standard goods in every respect save that of price. Unfortunately it sometimes happens that the dealer is not well enough versed in the principles of merchandising to appreciate the fact that this last exception must carry with it others which do not appear on the surface. In fact, exceptions to this rule of exception must be rare indeed and hard to find.

Interested at numerous reports which reached his main office from various outposts as to the prevalence of concerns offering mail order prices on goods much in demand and alleged to be up to the mark in every other particular, one well known manufacturer recently was fain to make an investigation on his own account. The result as announced in his house organ is to the effect that many of the parts offered actually were those discarded by himself and other makers, because of unsuitability or through becoming obsolete. Overstocks of parts and accessories, with makers and dealers alike, as a matter of fact, form attractive bait for numerous impostors who trade more or less upon misrepresentation. Such stocks, bought in at a low figure often are disposed of to good advantage from the profit standpoint by virtue of cautious and misleading use of the names of the very interests which have disposed of them.

The rapid multiplication of houses which deal in questionable offerings of the sort as well as the fact that their practices have come back to the very door of the manufacturer in many instances through the heedlessness of his agents, points to the necessity of extreme caution in dealing with firms which are not well-known to the buyer. Agents and supplymen who are thoroughly alive to their own interests and to the possibilities of the market have had no difficulty in keeping alive up to this time, nor is there indication that they will be caused to suffer through suppression of their profits if they continue to deal with the open and above board sections of the market. Cut price catalogs always will hold an attraction for the individual buyer, both as a class, and as an individual, for at least one complete cycle comprising the purchase and attempted use of inferior goods. But the dealer should learn to avoid opportunities which hold forth glittering promise of a disproportionate return for a given amount of outlay.

Producer Gas Possibilities.

Because of the rapid advances which are being made in the development of the gas producer in large powers, and in the installation of high-duty power plants employing internal combustion motors fed by producers, it is natural to infer that the future of the motor vehicle may hold some measure of service for this type of generator. Indeed, its application successfully to marine propulsion, not to mention a few spasmodic attempts at introducing it into commercial vehicle service, would seem to lend color to the impression where the difficulties incident upon its operation are not fully understood. At the same time, circumstances peculiar to the operation of the suction type of producer, which is the only kind which appears to lend itself to small powers, are such as to make it appear that its applica-

Digitized by Google

tion to vehicular propulsion, if possible at all, can come only after long years of study and improvement.

These difficulties, as voiced recently by a gas engineer, himself a builder of both stationary producer and automobile engines, hinge about the construction of the generating chamber and the necessity of rendering it at once air-tight and impervious to heat. Incidentally also, present methods of construction are such as to make a successful producer altogether too heavy to be available for auto propulsive purposes except on a very large scale. Thus, where it may be successful as applied to the new British battleship, the specifications for which were announced this week, for example, its use in smaller units on a land-going vehicle would be totally out of the question.

Briefly the principle of the suction producer is that of inducing a sharp blast of mingled steam and air to pass through a bed of incandescent coke or coal from which by a process of successive reactions the producer gas is formed, which is mainly carbon monoxide. This is at once passed to the internal combustion engine where it is used in exactly the same way that the ordinary gasolene vapor is employed. In the suction producer, the suction of the engine in drawing in its charges, supplies the necessary draught for the producer, while the waste heat of the producer itself is utilized in the production of the steam necessary for the process. In this way the apparatus may be made comparatively simple and requires little of no attention even when operated for many hours in succession. Its success, however, depends among other things, upon the retention of the proper degree of heat in the fuel bed within the producer—which may be somewhere about 1,800 degrees Fahrenheit—and upon the exclusion of air from the system, from the main air inlet clear through to the inlet valves of the engine. These requirements, in a word, are thought to spell the exclusion of the suction producer from the automobile field.

In order to retain the heat of the fuel bed and also to prevent excessive radiation and heat loss, it is customary to use a heavy fire-brick lining for the fire chamber of the producer: Besides adding a very considerable increment of weight to the apparatus, this material is so brittle and unreliable even in stationary practice, that it is little likely that it could be made to withstand the severe vibration of the motor vehicle without disintegrating. Further, it is found difficult to prevent air leaks at times, even with a stationary plant operating under the best of conditions, the effect of such leaks, if in the producer itself, being to lower the temperature and alter the action of the producer, if not to check the production of the gas altogether, even causing complete combustion to take place within the fire chamber, thus destroying the purpose of the apparatus entirely; while the introduction of air into the system at any point between the producer and the engine, naturally tends to weaken the suction and so to reduce the efficiency of the apparatus.

In consequence of these difficulties, and pending the production of a system which shall involve less exacting requirements in the formation of the gas, it may be considered that the producer system is hardly feasible, even in the instance of heavy vehicle service, which is the only connection in which it has as yet been experimented with, so far as is known. Its advantage, of course, lies in its ability to use coal, coke, or even some of the low grade fuels directly, instead of requiring that they be subjected to any of the intermediary processes of distillation, such as commonly are employed in the production of benzol or the other coal derivatives. Such investigations, however, now appear to hold little encouragement for the experimenter.

The way to encourage sport is to make its promotion as inexpensive as possible, which means merely nominal sanction fees. The A. A. A.'s new tariff will do no more to encourage the sport in those small places where encouragement is so much to be desired than did its former schedule. Fancy a small club paying $50 for the privilege of conducting a modest hill climbing contest! "We need the money" is written all over the A. A. A. tariff.

"Men who live in glass houses should not throw stones," is an old proverb which the outward and visible sign of the Florida speed carnival should take to heart. If he believes that a new rule is admirable he should accept it without shuffling or stone-throwing, else there may be those who will question that he believes what he says.

So the New York lady who so long has been the press agents' delight, broke the "women's record" at New Orleans! Lovely! But when will the A. A. A. put its foot down on that sort of thing?

COMING EVENTS

February 20-27, Newark, N. J.—New Jersey Automobile Trade Association's show.

February 20-27, Hartford, Conn.—Automobile Dealers Association's show.

February 22-27, Portland, Me.—Automobile show.

February 24-27, Baltimore, Md.—Automobile Club of Maryland's show, Fifth Regiment Armory.

March 1-6, Buffalo, N. Y.—Buffalo Automobile Club's 7th annual show, Convention Hall.

March 1-6, Providence, R. I.—Automobile show.

March 2-6, Rochester, N. Y.—Automobile and Motor Trades Association of Rochester show, Convention Hall.

March 3-6, Lincoln, Neb.—Second annual automobile show, Auditorium building.

March 6-13, Boston, Mass.—Boston Automobile Dealers Association (Inc.) seventh annual show, Mechanics Building.

March 8-13, Kansas City, Mo.—Kansas City Automobile Dealers Association's show, Convention Hall.

March 8-13, Portland, Ore.—Portland Automobile Club's show.

March 10-13, Memphis, Tenn.—Automobile show, Auditorium building.

March 11, 12, 13, Milwaukee, Wis.—Milwaukee Automobile Club's first annual show in the Hippodrome.

March 13-20, Minneapolis, Minn.—Minneapolis Automobile Show Association's show, National Guard Armory.

March 15-20, Rochester, N. Y.—Rochester Automobile Dealers Association's show, Convention Hall.

March 16, 17, 18, Chattanooga, Tenn.—Three days race meet and hill climb on Lookout mountain.

March 17-18-19, Pittsburg, Pa.—Three days' endurance run.

March 22-27, Toledo, O.—Toledo Automobile Dealers Association's automobile show.

March 23-26, Daytona, Fla.—The Motor Contest Association's (Inc.) seventh annual international races, Daytona Beach.

March 24-27, Syracuse, N. Y.—Syracuse Automobile Dealers Association's first annual show, New York State armory.

March 27-April 3, Pittsburg, Pa.—Automobile Dealers Association's show, Duquesne Garden.

April 10, New York City—New York Automobile Trade Association's second semi-annual hill climb on Fort George hill.

April 15-17, Louisville, Ky.—Louisville Automobile Association's show, Coliseum.

May 22, Hartford, Conn.—Automobile Club of Hartford's 200 miles endurance run.

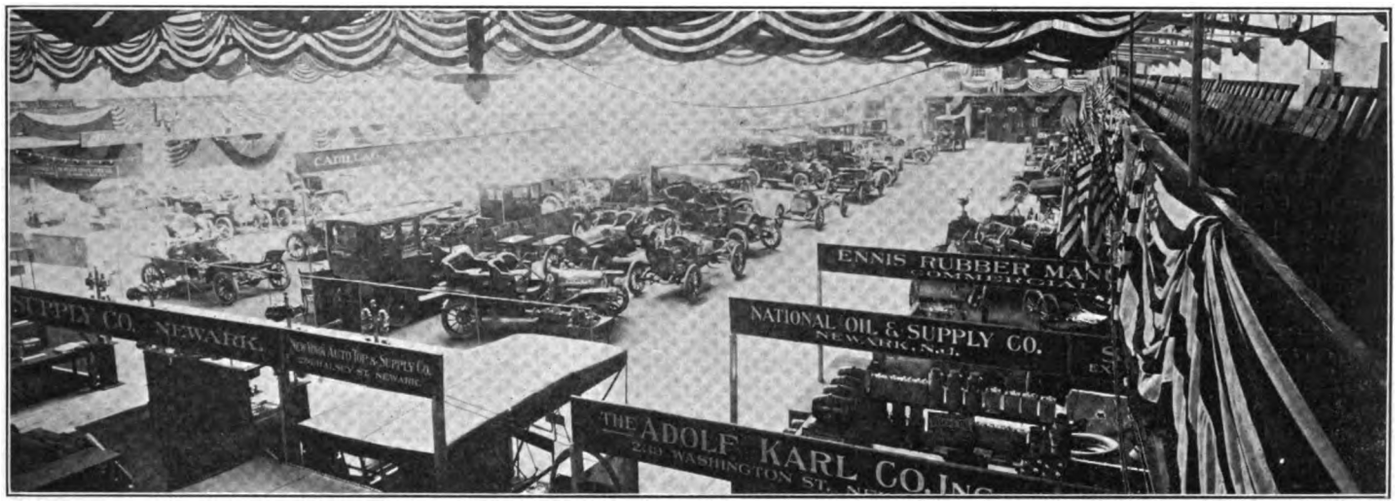
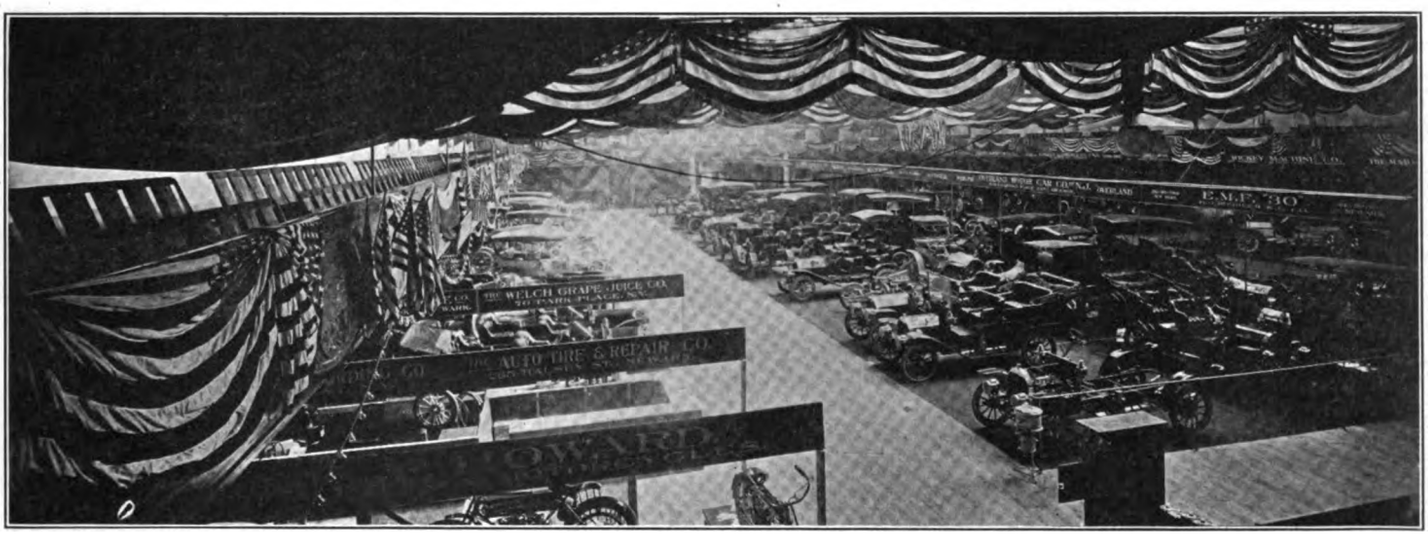
NEWARK GOES TO HER OWN SHOW

About 100 Cars Staged Make a Representative Display—Neat Decorative Scheme and Variety of Entertainment.

It only costs a quarter to ride on the steam railroad from Newark, N. J., to New York City and back, while if one be a commuter with a "family," 60-trip ticket, it costs even less. So when the big automobile shows were held at the Palace and the Garden, respectively, in Manhattan, it would have been reasonable to suppose that everybody in Newark whose thoughts inclined toward motor cars would be on hand to select their machines at that time if at all. But like the fair ocean liner passenger with the very white face who on the first day out





ONE OF THE DECORATIVE DETAILS AT THE NEWARK SHOW

cars, but the true citizens have played mountain to the automobile show's Mohammed and which continues through this week. Being new within the year and providing plenty of space, the armory makes an excellent exhibition hall.

In addition to the gold cup Grand Prize trophy, some model airships and areoplanes and a free moving picture show of the famous automobile races of the past year, features contributing to the general wonder and delectation of the crowds, the exhibition is strong in its appeal by reason of the great number and variety of cars that are displayed, products of representative makers. There are almost 100 cars on view, which is immensely above the average for what are known as "local" shows, as distinguished from the national shows at New York, Chicago and Boston.

A simple scheme is used in the decorations, but the neatness of the signs and the gay display of the red, white and blue bunting overhead, as revealed in the accompanying illustrations, affords a very satisfactory effect, while really giving the cars themselves a chance to reveal what color and decorative beauties they may have. By some miscalculation, the electric lighting

TWO GENERAL VIEWS OF THE NEWARK SHOW

was asked if she had lunched—it is a case of "Quite the contrary!"

Some near-Newarkers, like Frank Kramer, the bicycle sprint champion, sneaked over to the New York affair this time and bought and have waited for the exhibition to be brought to them. Furthermore, they get an extremely good show, too, as is proved by the affair which opened Saturday night, 20th inst., in the new Essex Troop armory,

Digitized by Google

on the opening night was not quite as effective as it should have been, and when at times some of the lights were turned off to give the moving pictures a chance to be seen, there were sarcastic exhibitors who requested that the picture outfit be allowed to run all the time as the reflected light from the screen seemed to give more illumination than the half-size incandescent bulbs. Improvements in this respect were made later, however, by the installation of additional lights of greater power.

Not alone Newark dealers, but several firms from New York City, have exhibition spaces for cars, while the accessory people are from everywhere. Following the fashion of the larger shows, there is the customary amount of expanded representation both as to attendance and as to the amount of business done.

The exhibition, which is a "second annual," is given under the auspices of the New Jersey Automobile Trade Association, to which the Associated Automobile Clubs of New Jersey are giving co-operation. The direct management is under H. A. Bonnell, with G. H. Raddin as his assistant. The complete list of exhibitors is as follows:

Automobiles: Atlantic Motor Car Co., Stoddard-Dayton; Brush-McLaren Motor Co., Brush; Cordner, Flinn & Toppin, Acme; Crawford Auto Co., Crawford; Dunham & Son, D. B., automobile bodies; Ellis Motor Car Co., Pierce-Arrow; Essex Auto Co., Ford and Jackson; Fiat Auto Co., Fiat; Greene Motor Car Co., Locomobile; Johnston Co., P. H., Regal and Grout; Koehler, H. J., E-M-F.; Martin Auto Co., F. C. L., Mitchell; Mason, J. W., Maxwell; Middleby Auto Co., Middleby; Motor Car Co. of New Jersey, Cadillac; O'Neil Motor Car Co., Premier and Reo; Oldsmobile Co. of New York, Oldsmobile; Overland Motor Car Co., of New Jersey, Overland; Paddock-Zusi Motor Car Co., Chalmers-Detroit; Page & Co., Carl H., Peerless; Quinby & Co., J. M., Pennsylvania and Isotta; Rambler Auto Co of New Jersey, Rambler; Rickey Machine Co., Marmon; Spaulding & Bros., A. NATIVE CARS AT BALTIMORE SHOW

Three Maryland Manufacturers Stage Their Products — Many Leading Makes Among the Vehicles on View.

Because of a downpour of rain which hindered the transfer of the cars and other exhibits from the show rooms and railroad yards to the Fifth Regiment armory on Tuesday of this week, the opening of Baltimore's show, which had been scheduled for 10 o'clock Wednesday morning, was set over until the afternoon, and even when 2 o'clock arrived and the doors were actually opened to the public there yet remained a number of details to be attended to before the show could be really deemed complete. Electrical displays of various sorts are prominent in the decorations. Contrary to the general rule of present day shows, a number of the exhibitors have arranged for special illumination for their stands, as a result of which the old-time heterogeneous effect is recalled to the mind of the show goer.

Quite the most striking thing about the show is the huge electric sign prominently displayed in such a way as to attract the attention of the visitor upon entering the armory. It reads: "The Automobile Club of Maryland—the Club of Accomplishment." For this is a club show, be it understood, and to further carry out the spirit which is actuating its promoters, it has been arranged that members of the club shall wear little ribbons significant of the fact, during the period of the show.

Of new developments brought out at this particular one of the numerous local exhibitions, considerable stress is being laid on the three Maryland-built automobiles, neither of which has appeared at any of the other and previous shows. They are the Spoerer, Maryland and Burns—the latter a buggy type of vehicle, with a covered body which is adapted to be entirely enclosed, and is intended especially for the use of country physicians and others who are forced to travel much in all weathers. In addition to these, the local display has an addition this year in the Studebaker line, both gasolene and electric, which has not before been shown.

Some half a hundred exhibits all told, comprise the show, of which somewhere about 30 include the various exhibitors of cars. Of different makes of car, it should be observed, there are exactly 40. Only one of these is of foreign origin. The list of exhibitors is as follows:

Automobiles: Auto Equipment Co., Rambler; Auto Outing Co., Palmer & Singer, Simplex and Buick; Broadbelt, H. A., Stanley; Brush-Nichols Co., Brush; Burns Bros., Burns; Clark, D. A., Pope-Hartford and Lozier; Ford Motor Co., Ford; Foss-Hughes Co., Pierce-Arrow; Houghton, Chas. E., Overland; Lambert Auto Co., Maxwell; Mar-Del Mobile Co., Franklin, Packard and Waverley electric; Motor Car Co., Stevens-Duryea, Thomas and E-M-F.; Mount Vernon Motor Co., Autocar; New Bridge Garage Co., Cadillac; Olds Motor Works, Oldsmobile; Rice's Garage, Pennsylvania, Welch, and R. & L. electric; Sandruck, F. H., Gaeth and Chalfante; Shaffer Mfg. Co., Pullman; Shuler, W. P., Mitchell; Sinclair-Scott Co., Maryland; Spoerer's Sons, Carl, Spoerer; Stoddard-Dayton Baltimore Auto Co., Stoddard-Dayton and Renault; Walker, Dixon C., Studebaker, gasolene and electric; Wilhide, J. L. B., Kisselkar; Winton, Wiesenfeld, Little Joe, Oakland and Reo; Zell Motor Car Co., Chalmers-Detroit and Peerless.

Accessories: James G. B. Davy Co., Little Joe Wiesenfeld, Auto Equipment Co., Carl Spoerer's Sons, Baltimore Buggy Top Co., E. A. Cassidy & Co., Hector C. McRea, Baltimore Rubber Tire Co., Maryland Railway Electric and Supply Co., Standard Oil Co., National Sporting Goods and Auto Apparel Co., Jones's Machine Co., Howard A. French, Frank B. Burton, Great Eastern Optical Co.

San Jose Show Exceeds Expectations.

Preceded by a parade in which most of the cars in the city took part San Jose's second annual show in the Auditorium rink proved far more elaborate, even than had been anticipated. A dome of dazzling light surmounted the bandstand in the center of the large hall, the musicians being screened by a network of potted palms and other greens. Smilax and evergreen branches transformed the dancing enclosure fence into a pretty hedge in which were concealed incandescent bulbs. Thousands of colored bulbs and Chinese lanterns strung around the rafters and ceilings, gave the hall the appearance of an oriental tea garden. Hundreds of white pedestals, surmounted by vases of cut flowers, heightened the brilliant color effect. The show continued from Wednesday to Saturday of last week, 17-20 inst.

Following is a list of the exhibitors:

Automobiles: M. B. Charles, Stevens-Duryea, Studebaker, E-M-F., Palmer & Singer and Woods electric; Ford Automobile Co., Ford; Garden City Implement Co., International; W. F. Hunt, Thomas Flyer, Chalmers-Detroit, Buick and Oldsmobile; Letcher's Garage, Cadillac, Pierce, Peerless and Apperson; Normandin-Campin Co., Franklin; Osen & Hunter Auto Co., Mitchell and Baker electric; Harrison P. Smith, Reo, Stoddard-Dayton and Kisselkar; Victory Motor Car Co., Sunset.; Wallace Bros., Rambler, Regal and Pope-Waverly electric; Winton Motor Carriage Co., Winton; J. H. Bennett, Tourist; A. C. Banta, Indian motorcycles; William H. Bracher, Excelsior and Pierce motorcycles.

Accessories: California Compounding Co., Osen & Hunter Auto Co., Samuel P. Reed, Harrison P. Smith, Melvin & Murgotten, Millard Bros., and Santa Clara County Automobile Club.

HARTFORD UNDER THE SHOW SPELL

Latest Models of Cars Brilliantly Staged Attract Big Attendance—Social and Trade Success.

"Not only is the eye enchanted by the succulent sweetness of the translucent spray, dashing like an ethereal veil high into the perfumed atmosphere, but," the automobile show at Hartford, Conn., this week has a host of other features, according to the local enthusiasts, calculated to make it impossible "for the least imaginative or the most cynical of observers not to feel the spell akin to some half-forgotten childish idea of fairyland falling about him."

A five-jet carburetter fountain in the middle of Foot Guard armory supplies the succulently sweet spray, and the decorations are composed chiefly of electric lights of all colors and bowers of southern smilax, while the walls are finished in green burlap. Heavy eyed decorators were still laboring frantically Saturday night, 20th inst., when the show opened, as they had been obliged to do the main part of their work in the dark hours of Saturday morning after the gay blades of the Veteran Firemen's Association had escorted their fair ladies away from the association's dance about 3 a. m. Most of the electric lights were in working order by the time the visiting crowds jammed through the main entrance, but the completion of the decorations was carried on busily through the evening.

Last year the Hartford show was remarkable for returning to the exhibitors practically all of the money paid for show space, and the "second annual" this year, is in charge of the same committee, consisting of F. A. Dart, S. A. Miner and E. G. Biddle. When Hartford does have an automobile show it knows it, and very few of the citizens are able to resist the opportunity to see what the show press agent, in a burst of grandiose effulgence, describes as "the crowning effort of the most picturesque of modern industries; the gathering together of every important car of the latest model and luxuriant design, arranged in a setting which for accuracy of detail, perfection of light and color, and magnificence of the whole will form a proper setting for the jewels which it is designed to cover."

Thus placed in a scene giving the effect of a "garden under the soft night of the tropics, with the luxuriant foliage of the palms and the smilax, the dashing of the fountain, and overhead the thousands of lights twinkling through the ceiling of flowers," the exhibits themselves enjoy a glory which taken in connection with the Hartford liberality in the matter of purchasing cars makes the affair quite as successful from the trade standpoint as its promoters have endeavored to make it in the spectacular and social way.

The exhibitors of cars include: Atlas Motor Car Co., Springfield, Mass., Atlas; R. D. & C. O. Britton, Hartford, Conn., Maxwell, and Stoddard-Dayton; Brown, Thomson & Co., Hartford, Conn., Packard, Stevens-Duryea and Cadillac; Capitol City Auto Hack and Livery Co., Hartford, Conn., Mitchell; Dunbar & Mansir, Holyoke, Mass., Elmore; Elmer Automobile Co., Hartford, Conn., Ford; W. J. Hickmott, Jr., Hartford, Conn., Stanley; Thomas B. Jeffery & Co., Boston, Mass., Rambler; A. E. Lazzaro & Co., Hartford, Conn., Jackson; The McCue Co., Hartford, Conn., McCue; The Miner Garage Co., Hartford, Conn., Pierce, Knox and Buick; The Palace Automobile Station Co., Hartford, Conn., Thomas, Oldsmobile, E-M-F., White, Autocar and Waverley; Alfred W. Peard, Hartford, Conn., Overland; T. Dudley Riggs, Hartford, Conn., Palmer & Singer, and Simplex; J. A. Wood, Hartford, Conn., Jewel.

The accessory exhibitors, occupying the gallery and part of the basement, are as follows: Alling Rubber Co., tires and specialties; E. R. Clark, copper paint and engines; Fairbanks Co., engines; A. L. Foster Clothing Co., goggles and clothing; G. W. Fuller Co., automobile trunks; Hartford Auto Supply Co., accessories; Hartford Mill Supply Co., tools; Mansuay & Smith, painting and body work; George S. Maslen, Indian motorcycles; Perfection Wrench Co., wrenches; The Post & Lester Co., motor car supplies; James Pullar & Co., bodies, shields and tops; Smith-Worthington Co., thermos bottles and specialties; Tracy, Robinson & Williams, tools and specialties.

Thursday night the exhibitors and others are to gather at the Allyn House for a banquet. The affair will be given by the Hartford Automobile Dealers Association, which through its committee is responsible for the show. During the week both the Pope Mfg. Co. and the Electric Vehicle Co., which are located in Hartford, are keeping open house at their respective factories, where their 1909 models are staged in exhibition array in lieu of appearing at the dealers' show.

Syracusans Organize for a Show.

Syracuse, N. Y., is to be numbered among the show holding cities, an association of the local automobile dealers having been organized for the purpose. The affair will open March 24, and will last four days, according to present plans. An option has been secured on the New York State armory, for the last week of the month. The organization of the dealers, which will be incorporated under New York State laws and which will be known as the Syracuse Automobile Dealers Association, held its election of permanent officers last week, C. Arthur Benjamin being chosen president. In addition the following were elected; H. D. Van Brunt, vice-president; M. W. Kerr, secretary; H. L. Conde, treasurer. There are fifteen charter members and seven associate members.

CLEVELAND'S SEVENTH ITS BEST

Automobile Show Held in the Lavishness of Cut Flowers and Other Luxuries—The Exhibitors.

Cut flowers, Oriental rugs, electric fountains, gold arches, colored incandescent bulbs grouped in the form of an immense automobile, canary birds, and similar lavish decorative features have produced an effect in the big Central armory in Cleveland, O., which makes the seventh annual show this week a very agreeable place. The exhibition, which is managed by the Cleveland Automobile Dealers Co., opened on Washington's Birthday and lasts until Saturday night. The display includes cars either manufactured or represented by 27 automobile exhibitors, resulting in the staging of 125 machines. The list of exhibitors is as follows:

Automobiles—The Auto Shop Co., Thomas and Selden; Buick Motor Co., Buick; Barger Automobile Co., Cadillac; The Broc Carriage & Wagon Co., Broc electric; Cameron Auto Co., Cameron; Commercial Car Co., Apperson-Toledo; Chisholm & Phillips Automobile Co.; Crawford Motor Co., Jackson; The Detroit Electric Co., Detroit electric; Elmore Motor Car Co., Elmore; Ford Motor Co., Ford; The Gaeth Automobile Co., Gaeth; Hall Brothers, Cartercar; Lucas & Christenson, Mitchell; The Jewel Motor Car Co., Jewel; Harry S. Moore, Stoddard-Dayton and Brush; Maxwell-Briscoe Co., Maxwell-Briscoe; Olds Motor Works, Oldsmobile; The Peerless Motor Car Co., Peerless; Pullman Motor Car Co., Pullman; Price Bros. Carriage Co., Baker electric; Reese Motor Car Co., Royal Tourist, Corbin and Columbus electric; The Rambler Automobile Co., Rambler; The Rauch & Lang Carriage Co., Rauch & Lang electric; The Standard Automobile So., Packard and Franklin; The Studebaker Automobile Co., E-M-F. and Studebaker; Charles B. Shanks Co., Stearns and Chalmers-Detroit; The Winton Motor Carriage Co., Winton; Wingle Motor Car Co., American Simplex and Midland; The White Co., White steamers.

Accessories—The Austro-American Separator Co., Akron Auto Supply Co., Casino Cycle & Supply Co., Cleveland Tanning Co., Collister & Sayle, Cleveland Auto Top & Trimming Co., Domestic Vacuum Cleaner Co., The Globe Oil Co., The German Chemical Supply Co., B. & B. Mfg. Co., H. W. Johns-Manville Co., The K. W. Ignition Co., Fawn River Mfg. Co., L. J. Mueller, Charles E. Miller, Pennsylvania Rubber & Supply Co., The Perfection Spring Co., Reflex Ignition Co., Rochford Mfg. Co., Standard Top & Equipment Co., Mannie Strauss, The Stein Double Cushion Tire Co., H. H. Ward and associates, Way, Mitchell & Co., The Willard Storage Battery Co., The Westinghouse Electric & Mfg. Co., The Zenith Motor Goods Co., G. H. Williamson.

ABOUT MAKING ALUMINUM JOINTS

Difficulties Attending the Process of Soldering or Welding—Proper Solders and Their Application.

Difficulties attendant upon soldering or welding aluminum, which have been considered more or less mysterious by the average workman, as by the average motorist as well, are fully explained by the statement that while the metal itself fuses readily enough with a number of other metals, it is remarkably subject to the effects of oxidation—so much so, in fact, that hardly more than an instant's exposure to the atmosphere is sufficient to render it impervious to fusion. This is due to the formation of a thin, invisible layer of oxide on the surface which it is desired to treat. This tendency, according to the Scientific American, is the sum and substance of the chief drawback which has been held out against this remarkable metal by the common run of those who are familiar with its use.

"There is no solder which operates with aluminum in the same way that ordinary solders operate with copper, tin, etc.," the author goes on to say. "There are two reasons for this.

"First. Aluminum does not alloy readily with solders at temperatures as low as the other metals require, and it is consequently necessary, in soldering aluminum, to use a much higher temperature. Furthermore, aluminum alloys with lead only with great difficulty and with but a small proportion of lead at that; consequently lead solders are useless with aluminum.

"Second, The surface of all aluminum is covered with a thin invisible coating of aluminum oxide. This coating forms instantly on the surface of aluminum and is very refractory, and its presence is responsible for the high resistance of aluminum to corroding agents, since, although aluminum itself is soluble in a great many chemical compounds, this protective coating of oxide is insoluble in almost everything excepting hydrofluoric acid. While in general this coating of oxide is beneficial, in that it forms a perfect protection to the aluminum underneath, it is, by reason of its efficiency in this particular, responsible for the principal portion of the difficulty which occurs in soldering aluminum, as naturally no solder will alloy with aluminum oxide.

"In soldering aluminum, therefore, it is necessary that this oxide must be removed before the soldering can take place; and as it forms again instantly after removal, it is necessary that the removal of the oxide and the covering with solder shall be simultaneous. In soldering other metals, the oxide can be removed chemically. With aluminum this is not possible, and it must be removed mechanically by abrasion.

"Bearing these facts in mind, it will be readily understood how aluminum soldering must be done. All the surface to which it is intended that the solder shall adhere must first be tinned. This is accomplished by heating the metal to a temperature above the fusion point of the solder used, and then rubbing the surface with a stick of the solder, thus rubbing the oxide off the surface with the solder itself, and covering the exposed points with melted solder, all in the same motion. In order to make sure that the tinning is thorough, it is better to rub the surface with a steel or brass scratch brush while the solder on this surface is still molten. This insures a thorough job of tinning. After the edges to be united are thus tinned, they may be sweated together with pure block tin, with the aid either of a soldering iron or blast lamp.

"With regard to the composition of aluminum solders, zinc appears to alloy with aluminum more readily than any other metal available for the constituent part of the solder; consequently all solders which will readily tin aluminum contain zinc in varying proportions. The solders which we have found to be most satisfactory are composed usually of tin, zinc, and a very small proportion of aluminum. These solders do not run very freely nor fuse as readily as ordinary solders, and it is necessary, as stated above, to use a higher temperature—so high in fact that extreme difficulty is found in using these solders with a soldering iron, and it is generally necessary to use a blast lamp.

"Another thing which must be borne in mind is that solder will not flow into an aluminum joint, even when tinned, by capilliary action as it does into copper or tin joints, and it is therefore necessary to place on the surfaces to be united all of the material necessary to sweat them together before the edges are brought into contact. In soldering aluminum joints, it is necessary that both the tinning and sweating shall be most thoroughly done; otherwise the joint will not be durable.

"On account of the presence of zinc in the tinning solder, the solder is decomposed by moisture, and unless the work is so well done that the joint is absolutely waterproof, it will not be durable. The quality of the workmanship has more influence than anything else on the permanence of the work."

After Grinding the Valve.

In connection with the usual rules for valve grinding it is commonly recommended that a piece of cotton waste be placed in the cylinder casting just at the mouth of the valve port to prevent any of the abrasive from entering the cylinder proper. It is quite as important, however, that the waste be removed after the process has been completed and the novice is almost certain not to think of the necessity of removing it, although its presence is so obvious.

NEW "HIGH-SPEED" TOOL STEEL

Foreign Metallurgists Make Remarkable Claims for Their Product—Some of Its Peculiar Properties.

What with characteristic assurance is claimed to be a revolutionizing development in shop practice is the introduction of a new "high-speed" steel which has been placed on the market by a British firm of metallurgists. And pending its actual trial in extended practical service, it must be admitted that it holds forth most alluring promise of great advantage over the tool steels at present in use. After lengthy experiments it is alleged that the properties of the new metal have been brought to a point where it possesses from three to seven times the cutting power of existing high-speed steel, together with the further advantage that, in contradistinction to most cutting steels, it can be hardened in water, oil or the air blast. In regard to its properties Professor Arnold, of Sheffield University, is quoted as saying that it is an absolute departure in metallurgy to have obtained a water quenched steel which will work for a considerable time on the hardest metal with the cutting edge at a bright red glow.

The new steel is the product of Jones & Colver, of the Continental Works, Sheffield. In regard to it, B. W. Winder, director and works manager of the Continental Works, explained that he was content not to make any sensational claims for the steel beyond the fact that it is the first high-speed steel produced that can be hardened in cold water without danger.

"At the present time," he said, "ordinary good high-speed steel on a soft material will work till the nose gets a red heat, but when it gets to that heat it only works a certain time before the heat breaks the tool down. Therefore the probability of getting steels to run at a faster rate is perhaps rather remote, though this difficulty will probably be overcome in the future.

"The great advantage of the new steel is that it will work very much longer at a high heat than the old. We don't claim for a moment that it is going to work four times faster than the present high-speed steel. What we do claim is that it is very superior to any steel that has been produced yet. It will go on working much longer without requiring regrinding."

The steel would not require special machinery, he went on to say. Moreover, the most dangerous time for ordinary high-speed steel to approach water is when it is in the dull red state, as it is then very liable to crack. But the new steel will not crack if plunged into water at any heat.

The new steel is not much more expensive than the old high-speed steels, so that in proportion to its capacity it works out much cheaper.

MOTOR CAR FOR TRACK INSPECTORS

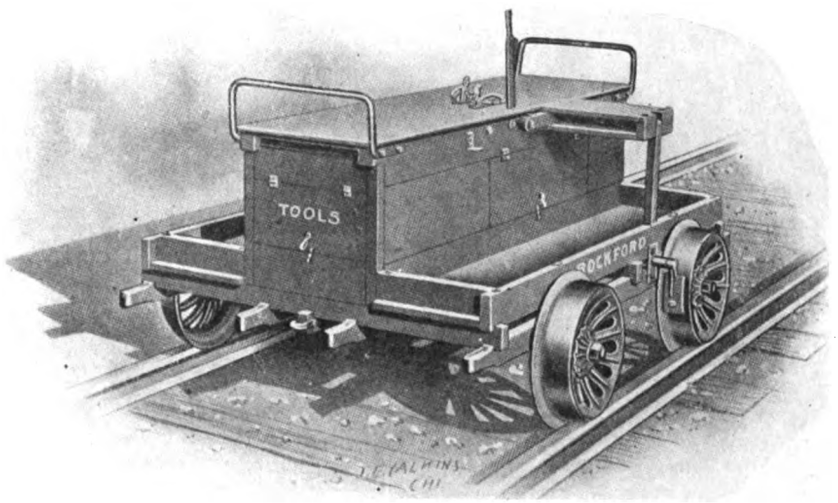
Simple Adaptation of Automobile Principles to Railway Service—Features that will Repay Study.

Considerable has been heard of the development of the gasolene motor car for railway service as applied to passenger haulage, but up to this time, comparatively little has been done in the exploitation of the principle as applied to smaller powers and used for light transportation. On this account no small interest attaches to the Rockford motor cars, which, though designed directly for use in replacing the familiar handcars such as are employed in railway maintenance by track inspectors and section gangs, is suggestive of great possibilities for industrial railway work as well.

By ingenious elimination of all superfluous details of construction, these vehicles have been literally reduced to their lowest terms, so that as a matter of fact they present practically none of the difficulties which, in the eyes of the motorist accustomed to the large and costly machines commonly used for pleasure driving on the highways, would seem to render the use of the internal combustion motor prohibitive in the case of the average track foreman or section boss. Minus any form of transmission gearing, and with a minimum number of parts, all very simple, they are started by being pushed along the track, controlled when in motion by means of the spark and

ROCKFORD MOTOR

throttle in the usual way, and stopped by cutting out the action of the exhaust valves.



As constructed to replace the common forms of hand car, they are equipped with a 7 horsepower twin-cylinder motor, which is claimed to have an effective driving range between 3 and 30 miles per hour. Furthermore, although powerful enough to carry a load of 10 men, they weigh but 650 pounds complete. Larger loads can be hauled by a car of similar construction, but equipped with a four-cylinder motor of similar design to the twin type. Further variations of the principle, are also found in a light inspection car which has seats for two passengers, who may face in either direction.

The unusual features embodied in the construction of these machines are, in the first place, the elimination, in addition to the transmission which usually is considered a necessity, where the internal combustion engine is employed, of the fly wheel. The connecting rods are coupled direct to a crank shaft, which is permanently affixed to one of the axles, while the cylinders are carried by a light frame which is bolted directly to the under side of the platform or other body. By way of valve gear, a short, transverse cam shaft runs across the head-ends of the cylinders and is driven by a light sprocket chain from the crank shaft, also carrying the timer for the jump spark ignition system; while the intakes are automatic. A special form of carburetter is mounted in the center of a short length of intake pipe communicating with the cylinders at short range. Lubrication is effected by means of oil cups, one of which is placed on the upper side of each of the cylinders.

Such is the arrangement of the cam shaft that the engine may be reversed without the use of any special device, while as a minor refinement, the control levers are so disposed that they always are moved in the direction in which the car is traveling. For stopping a device is employed which opens the exhaust valves in a manner claimed to be entirely original. This measure in addition to supplying an absolute check on the production of power, also provides automatic means of checking the flow of fuel to the cylinders, by stopping the suction, thus saving the waste of fuel and flooding of the cylinders.

Another peculiar feature of the motor is that it is entirely innocent of any cooling means. In explanation of this, it is stated by the makers, that as extremely low compression is employed, the cylinder temperatures never rise to a point where artificial cooling means are required. The same circumstance, it is claimed, also accounts for the fact that the engine will run under ordinary conditions and still remain free from carbon deposits.

Rockford cars are produced by the Duntley Mfg. Co., Chicago, Ill., who have fixed upon their specifications only after a thorough study of the problem of simple power production under the most adverse conditions embodying continuous service, slight attention and inexperienced handling. While there is little in their construction to suggest the ordinary types of automobile, their simplicity should entitle them to close consideration by those whose aim it is to build machines to satisfy similar requirements under the even more severe conditions which obtain with the vehicle designed for use upon the highway.

ROCKFORD MOTOR CAR FOR RAILWAY SERVICE

Souvenir Album for Motorists.

Partaking of the nature of a souvenir album and containing a large number of beautiful views, racing drivers' portraits, odd motoring scenes, and a colored poster picture, together with illustrations and specifications of the 1909 models of an extensive list of the prominent American makes of cars, the book issued for complimentary trade distribution by the Trenton Rubber Mfg. Co., of Trenton, N. J., and bearing the title "The Automobile of 1909," is a noteworthy and handsome piece of work. The substantial cover is silk corded and gold embossed, and fittingly suggests the excellent character of the contents. An examination of the specifications of the cars illustrated in the book discloses that all of them employ "Thermoid" brake lining, though the list of cars that the book contains is by no means the complete roster of those who have engaged to use this material during the 1909 season.

After taking up lost motion in a bearing, care should be observed in making the final adjustment so that the strain of the bolts does not come on the journal, but on the faces of the bearing lines or bushings.

DEVELOPMENT OF THE AUTOMOBILE

Taylor Gives Rapid Review of the Speed and Solidity of Its Progress—Where the Credit Belongs.

"During the past five years the automobile has undergone precisely the same kind of development, but at an unprecedented speed, which every new mechanism is obliged to pass through. It has been simultaneously improved in quality and cheapened by the natural method of the 'survival of the fittest' and the elimination of the more unfit constructions. This process is still going on, but at a slower pace than formerly. Few elements of the pleasure automobile have survived the past five years unaltered," remarks C. H. Taylor, engineer of the E. R. Thomas Motor Co.

"The motor has been quieted by attention to valve-operating mechanism, to the carburetter and to the exhaust line. It has been given remarkable flexibility by improvements principally in the carburetter and valve setting. The magneto has come into its own as the most reliable source of ignition current. The radiators have been strengthened and increased in cooling efficiency. The cylinder jacketing and lubrication have been cared for in such a way that there is no longer any excuse for an overheated motor.

"In the transmission system the old cone clutch has been greatly improved, and the newer disc types have been developed, it would seem, almost to perfection.

"Through the use of special materials and of special tooth forms, together with the annular type of ball bearing, gear boxes have been reduced in size and silenced. The sliding gear has practically eliminated all other forms of transmission, and unlike five years ago, there is no rival which seriously threatens its place. The live rear axle with entirely enclosed driving mechanism has been developed from a most uncertain mechanism five years ago to one of the most positive and reliable units in the car.

"As regards the running gear, the pressed steel frame was originated but little more than five years ago, and was seen only on one or two cars for several seasons. It is now universal, its advantages from the standpoint of strength, lightness and cheapness being now thoroughly understood.

"For front axles, the one piece drop forging of I-section has taken the place of the old built up tube, or hand-forged rectangular section.

"The springs, especially in the rear, have been lengthened, flattened, and made of better material, with corresponding increase in comfort, especially at high speeds.

"The wheels, apart from the hubs and tires, have undergone less change than any other important element, but considered as a whole, the adoption of drawn metal hubs, roller and ball bearings, together with detachable rims, have modified this unit very appreciably.

"The automobile engineer is not alone to be credited with the enormous advance which has occurred. Today he has at his command methods and materials which were unknown or difficult to obtain five years ago. Today the enormous volume of business which the automobile has created has enabled specialists in certain lines to equip themselves in a most complete manner for handling certain classes of work. Thus, it is possible to obtain pressed steel autogenously welded parts at low prices, which, if properly designed, are superior to anything that could have been made commercially at twenty times the price a few years ago. Five years ago the steel makers of this country were not equipped to turn out the special grades of steel required for high class automobile work, even at three times the price demanded today.

"In this way it may be said that every portion of the automobile has been considered from different points of view by men who had made this type of part a study for years before the advent of the automobile, and who thus were peculiarly well placed to help the automobile engineer in his work.

"To the large automobile manufacturer belongs the credit of having the foresight and daring to invest large sums of money in a new industry replete with pit-falls, and thus providing the engineer with the means of working out his problems. That the American is able to compete with and even beat the foreigner was most conclusively shown when a Thomas stock car beat the best that Europe could produce in the New York to Paris race.

"Finally the automobile engineer himself must be credited with the biggest share in the improvement of the car mechanism, since he has been the leader under whose direction others have worked towards the attainment of a common purpose."

To Modify Effect of the Fan.

A radiator and fan designed to give the best temperature in summer will cool the engine too much in winter. If the car is used in very cold weather it may be quite feasible to remove the fan belt altogether without producing overheating. If this is found impracticable a sheet of tin may be cut to the outline of the lower portion of the radiator and wired to the back of the radiator to cut off some portion of the fan draft.

Adapting Color to the Surface.

"Motor car surfaces are large, as a rule. The possible effect of various colors upon such surfaces should therefore be studied keenly. Some shades and tones appear to especial advantage upon large surfaces—others quite the opposite," cautions a thoughtful observer.

VARNISHING AUTOMOBILE BODIES

Work that Worries the Carriage Varnisher in His First Attempts—Suggestions for Meeting the Difficulties.

Carriage varnishers not infrequently, and very naturally, experience some difficulty when assigned to finish, or varnish, as the case may, be, their first motor car, especially if the surface happens to be a large one, says the Carriage Monthly, and after pointing out the chief difficulties that are encountered, it suggests practical methods for coping with them.

The shape and formation and sweep of panels are so entirely different, and the size so radically increased, that numerous varnishers confess to a sort of stage fright at the outset.

In the first place, larger brushes will be needed in order to negotiate the big, sprawling surface conveniently. On some of these great limousine bodies, for example, the brushes which the carriage varnisher is best accustomed to will be found decidedly too small, inasmuch as they necessitate working faster than the capacity of the varnisher will warrant and accomplish right results. He must therefore, familiarize himself with the brushes of larger size.

In like manner he must acquaint himself with the surfaces of increased size. No motor car surface is too large to be flowed entirely over without any laps. Varnish laps are dangerous at best.

Take in the size and special features of the surface, and of each individual panel, before applying the varnish. Then study the general requirements, after which proceed with the work. An inch bear's hair or badger's hair brush, preferably the latter, should be used to wet the outer edge of the panel with varnish. Then catch up the flow with the large 3 or 3½-inch half elastic, flat, bristle varnish brush for the rubbing varnish, and a full elastic brush for the finishing varnish, coating the surface, however large it may prove to be, in solidly before squaring up and laying off finally.

For these surfaces of prodigious size it is advisable to use both elastic rubbing and finishing varnish, although, of course, this is not absolutely necessary. But the elastic varnishes will be found great aids in getting over the surface of gigantic proportions.

The chief cause of failure, however, with the inexperienced motor car varnisher is the attempt to divide the surface, if an unusually large one, into sections, and introduce laps at the intersection of the sections.

Having acquired the importance of these things by observation and practice, the varnisher, if he elects to profit by them, will soon find himself in a position to varnish any motor car surface without trouble or inconvenience.

NEW IDEA IN SPRING SUSPENSION

Horizontal as Well as Vertical Reaction Taken care of in Hayber System— Specifications of the Design.

Despite the great variety which is displayed in the methods of spring suspension which are in present vogue in automobile construction, it is a significant fact that none of them are wholly satisfactory, and that inventors are constantly bringing to light new methods of accomplishing this apparently simple result. While in the earlier stages of motor vehicle development it was customary to utilize almost exclusively the principle of the elliptical or semi-elliptical spring, more recently the virtues of the helical form have come to be appreciated by designers. For the most part adaptations of this type of spring are confined to combinations with the elliptical form. In a few cases, however, the helical member is employed directly, and without the aid of any other means of cushioning shock or checking rebound.

A recent instance of this is found in the Hayber system—a British invention which is credited to one G. Willis Hayber, in which the entire cushioning of the chassis is obtained through the offices of a single helical spring member in each spring set, rebound being in a measure reduced by the action of a piston which rides upon the spring in a specially constructed cylinder. The latter, together with the piston rod, forms a radius member or connecting link between the chassis and the axle. But instead of being connected directly to the latter, it is pinned to an extension below it and formed integral with a second radius member also attached to the frame and to the axle. The two members of the suspension group thus form a triangle, the altitude of which varies as the body oscillates over the axle.

The arrangement may be better understood from the accompanying illustrations, in which the first figure shows the layout of the device and renders its working readily understood. The cylinder, C, which contains the spring, is articulated to the frame at the point, G, about which it is permitted to oscillate, while the piston rod, D, is linked to the lower end of the radius member, E, which, in turn, is pivoted to the frame at the point, H, and to the axle at F. A triangle is thus formed with G-H as its base, and its apex at the point of connection between the link, E, and the piston rod, D.

Obviously as the frame rises and falls, the effect of the motion will be to alter the altitude of the triangle, the necessary lengthening or shortening of one of its members being accommodated by the movement of the piston in its cylinder, and against the pressure of the contained spring. The second of the two illustrations shows the device in section, and reveals the position of the spring, A, and the piston, B, within the cylinder. Evidently by properly designing the cylinder and piston, the effect of a piston shock absorber may be secured, without in the least interfering with the action of the spring; while at the same time the lat-

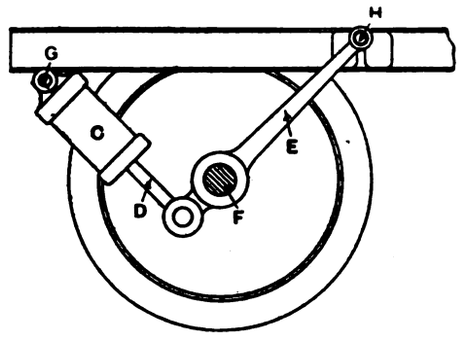

Fig. 1

ter is protected from the effects of dust and dirt as well as rust.

As its outlines would indicate, the inventor is possessed of a number of ideas which are not served by the more familiar methods of spring mounting. Among these is a theory that the road shocks which must be withstood by the suspension, while nominally only vertical in direction, at times assume a horizontal line of action, or at least, are possessed of a horizontal resultant, which is worth taking into account in laying down the suspension. It is his belief that below certain critical speeds, the road shocks are only vertical, while above those

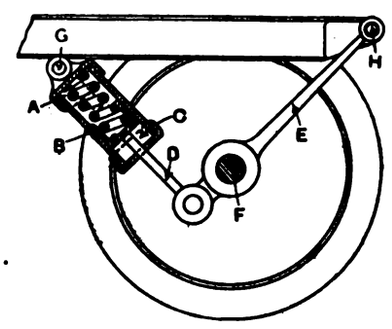

Fig. 2

speeds, they are horizontal. The intended effect of the peculiar design adopted is to counteract these high-speed effects by causing the spring resistances to be directed more nearly in the horizontal sense than ordinarily is the case. The critical speed considered in this connection, it should be observed, is somewhere in the neighborhood of 12 miles an hour.

Caution in Using Putty.

"For motor car surfaces never putty on the priming coat," says an experienced automobile painter. "Putty all work as smooth as possible, and never putty a crack or crevice that responds, by opening or closing, to twisting or wrenching of the surface."

TWO PROCESSES OF TIRE BUILDING

Goodyear Explanation of the Differences Between "Moulding" and "Wrapping" —Their Respective Results.

Much of the mystery which in the past has surrounded the terms "moulded" and "wrapped," in connection with tire construction, has been dissolved by the process of enlightenment which always comes to the experienced user of a manufactured product whether openly or in surreptitious ways. At the same time there are many motorists who even today must plead guilty to a more or less hazy idea of the distinction between the terms and of the advantages which are carried by each of the processes. The Goodyear Tire & Rubber Co., through the employment of a combination of the two methods in the construction of the tires which bear their name are in a position to define the properties of both, with less risk of bias than otherwise might be the case.

Thus, as they explain, the moulded tire is built up, layer by layer on an iron core. Over it is clamped an iron mould. It then goes to the vulcanizers. Here heat expands the rubber, creating enormous pressure inside the mould, which forces a perfect union between the layers of rubber and fabric which go to make up a tire. This pressure is so tremendous that a 2-inch cube of rubber enclosed in a cast-iron mould with walls 2 inches thick will crack the iron when subjected to the heat of the vulcanizer.

The weakness of the process lies in the fact that the building up of the fabric and rubber piece by piece is an operation requiring skill and dexterity. If the strips of fabric overlap ever so little—there's a ridge. If they fail to meet by the fraction of an inch—there's a hollow. These ridges, hollows, irregularities, are said in the curing to become hidden weaknesses and defects, because of which one moulded tire will last only 1,600 to 2,000 miles, while its mate stands up perfectly for 12,000 to 15,000 miles of hard riding.

The wrapped tread tire, on the other hand, is built up layer by layer on an iron core in the same manner. But before curing the iron core is replaced by an air bag—an extra strong inner tube. And instead of being clamped in a mould it is wrapped about with many layers of strong tape and is then cured, or vulcanized, in live steam. The compressed air in the air bag smooths out all the irregularities in the layers as your hand smooths out wrinkles in a garment—there can be no hidden ridges or hollows to induce blowouts and cut down the mileage. But it does not give the terrific squeeze that the moulded tire gets—thus lacks cohesiveness and unity—loses durability and strength.

Besides these two methods of tire mak-

Digitized by Google

ing, there is also the combination of the two employed by the Goodyear people. The tire is first put on the iron core, clamped in the iron mould, the same as the moulded tire, and enclosed in hydraulic press vulcanizers, surrounded by live steam until the rubber has expanded to the utmost—or until the squeezing has reached its limit.

Then before the rubber has fully set—while it is still plastic, it is removed from the vulcanizer and carefully inspected, the tread applied, the iron core is replaced by the air bag, the iron mould by the winding of heavy tape, it is inflated on a rim, put back into a vulcanizer and left until the curing process is complete. The iron core and the squeeze weld the tire into an inseparable whole. The air bag then smooths out any wrinkles, furrows or irregularities which may have been hidden from the inspector's eye.

Novel Points in Non-Skid Tire.

Numerous and varied are the properties and advantages claimed for the many types of non-skid tire which are to be found on the market, but in the Kempshall tire, which is a British product for which Cryder & Co., New York City, are sole American agents, are to be found a number of points not covered by any other individual brand of this utility. Unlike the average non-skid, they are of all-rubber construction, one inch of solid rubber being moulded into the tread in the peculiar form which is at once characteristic of the product, and its chief point of appeal to the user. Furthermore, as being constructed to run at from 15 to 20 pounds less pressure than is required by other makes, as saving the cost of chain attachments and as being always ready to prevent side slips whether on wet or dry roads, they are called the cheapest tire "per non-skid mile" on the market. A series of cone-shaped depressions on the tread surface, together with turrets on the side walls, constitute the special provision against loss of traction in either direction.

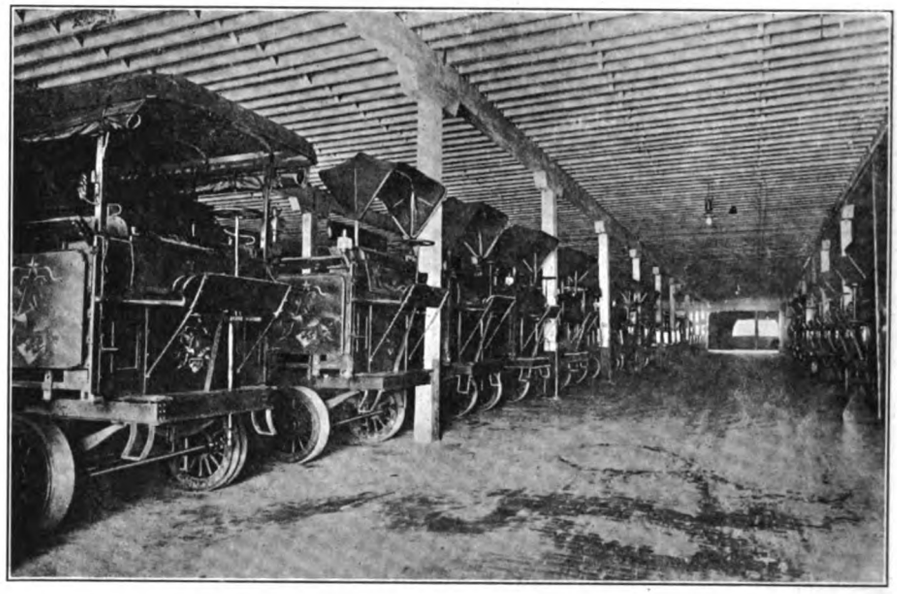
Big Repeat Order for Hartford Tires.

Following a period of more than 10 years experience with that particular brand, the New York Transportation Co. has just closed with the Hartford Rubber Works Co., for tire equipment for its entire lot of 25 new omnibuses soon to be installed in its Fifth avenue service. In addition to being the largest single order for 'bus tires ever placed in this country, the order is a "repeat," as a large proportion of the machines now running on Fifth avenue already carry Hartfords.

Concrete in Garage Construction.

Represented to combine great strength with non-inflammability, a concrete automobile garage was one of the features of the cement products exposition held in the Chicago Coliseum last week. Concrete roadways suitable for automobile traffic were likewise shown in section.

RELIABILITY OF MOTOR HAULAGE



Its Practical Demonstration in Four Years Experience of a Big Brewing Concern —Record of Performance.

Although the growth of the commercial vehicle has been slow in many quarters, and in some instances, partly because of the many discouragements attending its introduction even is held to have been greatly over-rated in the past, still its growth has been certain, and in a few notable instances remarkably extensive. Even though the cases in which firms adopting the motor in place of horse traction for haulage purposes have found it advantageous to increase their trial equipments to the absolute exclusion of animal service are comparatively rare, they serve as an apt illustration of what might be done in many other cases were proper judgment exercised in the administration of the service.

A striking example of the success which may attend conscientious and persistent efforts to introduce the motor vehicle for commercial purposes, is found in the case of the Anheuser-Busch Brewing Co. Association, of St. Louis, Mo., which at present, only four years after the inception of the motor vehicle project in connection with its work, has an installation of no less than half a hundred vehicles in constant commercial service, in addition to which the large private garage which it maintains houses a number of pleasure cars belonging to members of the association, several of which are employed more or less indirectly for business purposes.

In one instance, for example, a small electric runabout is used daily by an official in making his rounds of the vast plant, whereby many hours of time are saved in the course of every week, while his labor also is materially reduced. As a matter of fact, the passenger vehicles, which more properly might be classified as pleasure cars, number a baker's dozen.

Of the commercial vehicles several trucks are employed, but the majority are electrics. The total electric vehicle equipment numbers 53 trucks and delivery wagons, and of these more than half are Waverleys. Others are various patterns of Electric Vehicle, General Vehicle and Couple-Gear—these makes being used in 1½, 3 and 5 ton sizes. The Waverley equipment is mainly of the 1½ ton delivery size. The accompanying illustration affords a good idea of the extent of the "plant" which is required to house and care for them.

VIEW OF ANHEUSER-BUSCH TRANSPORTATION PLANT

In this connection some figures supplied by the makers of the last-named vehicles are valuable as showing the dependability of the electric when properly installed and scheduled: "Of the 53 electrics, 48 are in daily service; of this number, the following is a month's record:

"Twenty-eight did not lose a minute's service for any reason whatever.

Sixteen missed one day apiece during the month on account of the drivers not being on duty.

"Four lost from half to a full day on account of general repairs.

"In other words, the number of automobiles out of commission for the month on account of repairs, was less than ¼ of 1 per cent. of the total in operation—and this is the record of a company that keeps its wagons constantly active.

"To keep all the electrics in operation requires only one machinist, one battery man, a boy, a foreman and two wagon washers. This small amount of labor for so much equipment goes to show that electrics are easily maintained in first class condition."

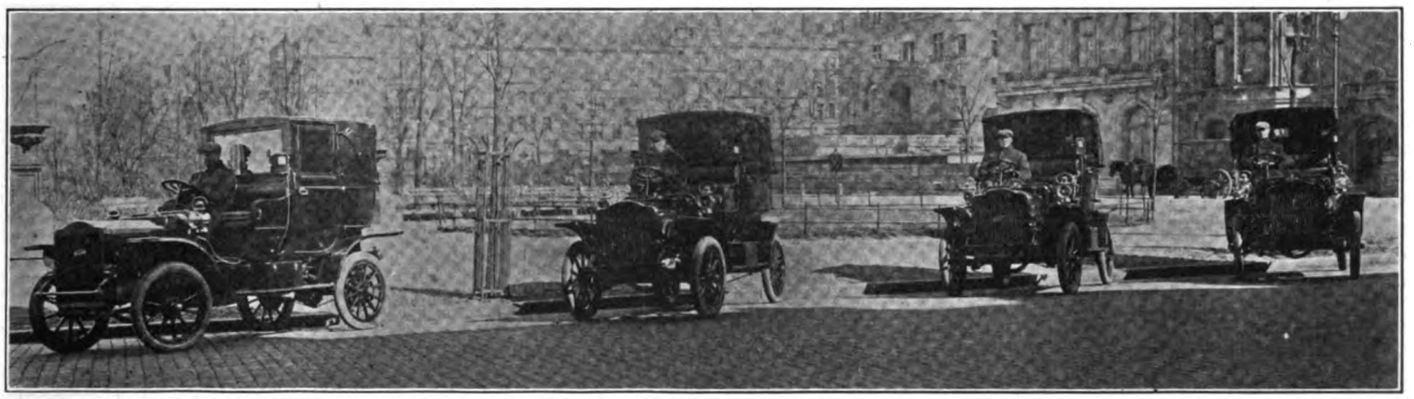
INSIDE DRIVEN CARS FIND FAVOR

New Franklin Model Adapted to Meet the Popular Demand—Features of Convenience in the Design.

Although the growth in use of the inclosed type of passenger motor vehicle has been so extremely rapid as to excite comment, it should be observed that one of its phases which has attained especial prominence during the past year more than ever before, though very significant, has escaped extensive notice. Though the limousine and landaulet types are becoming more popular every day, it is noteworthy that those machines which are constructed for the accommodation of not more than two passengers and are inside-driven, are especially popular just now. It also is noteworthy that they are designed to serve a slightly different purpose from the ordinary town cars in that they are better suited to the needs of the owner who uses his car for business purposes, as in the case of the physician. Recognizing this, one or two makers are producing such machines with an eye to supplying all the necessities of vehicular travel minus a few of the useless luxuries which are often embodied in the more elaborate types of town car.

Thus in the design of the 18 horsepower brougham built by the H. H. Franklin Mfg. Co., which is here illustrated, while the appointments are ample to suit the convenience of the passengers, no extravagant use has been made of superfluous trimmings or fittings. The doors are wide, providing easy entrance. The finish is in Franklin standard colors. The trimming of the interior is of goat skin with blue broad lace. A small front extension of the top affords protection when the car is being driven with the front window partly open, and this in addition protects the glass during severe storms. All the glass frames are made to either fold up or drop into grooves. The mud guards are of the conventional long curved pattern.

FRANKLIN 18 H.P. INSIDE DRIVEN BROUGHAM



MORE TAXIMETER CABS FOR ALBANY

Quartet from the White Factory Added to Steam Propelled Contingent—Buyer Commends the Type.

Development of the taximeter cab has been so rapid during the last couple of years, and the demand for machines of various structural patterns has been so great that only a very limited number of makers remain who have not at one time or another supplied their quota of vehicles to the popular movement, whether in the way of a direct effort at securing business in this line, or as the result of the importunities of agents and users. Just here it may be observed that it should be considered a particularly favorable token when, despite the presence in the field of such great numbers of vehicles as are produced especially for the purpose, a buyer insists upon having the principles which apply to his favorite form of pleasure vehicle embodied in machines upon which he expects to depend for an income.

In this connection, the instance may be cited of Matt De Freest, one of the largest liverymen in Albany, N. Y., who has recently secured delivery of four taximeter cabs for use in his business. When completing his purchase of the machines, which are White steamers, as shown in the accompanying illustration, De Freest said: "In placing this order, I am guided by my previous experience with one of your machines, which was always ready to run and never out of business."

The well known smooth working properties of the steam engine are such as to fit it particularly well to the purpose of the commercial vehicle, the popularity of which, all other things aside, depends in considerable measure upon its freedom from shock and jar, its controlability and silence. Furthermore, given its modicum of attention it is, next to the electric motor, the most dependable form of prime mover yet produced.

QUARTET OF WHITE TAXIMETER CABS FOR USE IN ALBANY, N. Y.

CREATING AN OCEAN BOULEVARD

Bill Embodying Governor Fort's Suggestions Introduced in New Jersey Legislature—Features of the Measure.

Governor Fort's plan for an ocean boulevard along the coast of New Jersey, from Atlantic Highlands to Cape May, has advanced so far as to be embodied in a bill introduced in the legislature by Senator O. H. Brown, of Monmouth, on Monday, the 15th inst. The measure creates an unpaid commission, to be known as the State Highway Commission, consisting of the Governor, president of the Senate, speaker of the General Assembly, and the commissioner of public roads, who are charged with the powers and duties specified in the bill. These, in brief are as follows:

Preparation of a route following as far as practicable the available and convenient roads now constructed, and as near the coast line as practicable. The commissioner of public roads shall, after a certified map of this road has been filed in the office of the Secretary of State, prepare maps and lists showing what portion of the boulevard traverses each of the several counties and municipalities, with the view of having the proper local authorties take such action as may be required on their part to carry out the general plan. Provision is made to authorize such local authorities to issue bonds to secure the funds required for necessary work, and to enter at once upon such work, but the bill does not obligate the State to accept any of the improved roads ceded under the provisions of the bill, nor to repair nor maintain the same until the legislature shall have made the necessary appropriations.

The eighth section of the bill reads: "The State Highway Commission herein provided for shall also prepare a route for a connecting highway across the State, connecting the several county seats of the various counties of the State with one another, from Newton, in the county of Sussex, to Cape May Court House, in the county of Cape May, following, as far as practicable, the available and convenient improved roads now constructed, and file said route in the office of the Secretary of State, as provided in the case of the ocean boulevard under the second section of this act. All the provisions of this act with relation to the ocean boulevard shall be applicable to the county seat highway herein provided for."

Impeaching a Justice of the Peace.

There was an unusual scene in the New Jersey legislature on Tuesday, 23d inst., when Mr. Burpo, of Passaic, in the House, offered the petition of the Automobile Club of America, asking for the impeachment of Manfred Naar, Justice of the Peace, of Trenton. The petition accuses Naar of extortion, violation of his oath of office and other "high offenses." It is set forth in the petition that Joseph S. Josephs, of South Amboy, got a letter from Naar on September 12, telling him that he had been fined $13.75 for exceeding the speed lifit, although Josephs insists he had not previously been served with a warrant of arrest or summons for trial. Several other similar cases were also cited in the petition, in none of which, it was asserted, were warrants executed, and, it was set forth, "in each case the sums of money were extorted by said Naar under cover of his said office." The petition was referred to the committee on judiciary for consideration. The case is the outgrowth of a civil action brought against Justice Naar last November through counsel acting for the Automobile Club of America on complaint of several motorists who had suffered alleged injustice at his hands.

Buffalo Squelches the Joy Riders.

Buffalo, with its proportionately large quota of motor cars has been a mecca in the past for car lifters and joy riders. This delightful occupation had grown to such an extent that the Automobile Club of Buffalo, whose members were the chief sufferers, decided to put a crimp in the activities of the Auto Thieves and Joyriders Association of Buffalo, Ltd., and hung up a prize of $50 for the arrest and conviction of any person who "borrowed" or maliciously injured any car belonging to a member. As the knights of the locust in the Bison City are not averse to sharing in the wealth of the plutocrats who constitute the local automobile club, the rich prizes hung up were an incentive to bring forth their best efforts in running to earth the bold marauders.

Two purses already have been annexed by zealous bluecoats who corralled and placed in durance vile the thieves who had got away with cars belonging to members and abandoned them, after the mechanism had quit work from abuse and neglect. As a result of the energetic campaign waged against them by the valiant coppers the Auto Thieves and Joyriders Association of Buffalo, Ltd., has practically wound up its affairs.

Berlin Forbids Gasolene Taximeter Cabs.

Press despatches from Berlin announce that the police authorities have recently issued a notice to the effect that no more licenses will be granted for taximeter cabs driven by gasolene engines. No reason for the decision is given, but its effect is considered serious in as much as the operating companies still have a considerable number of cabs on order, upon which preliminary deposits have been paid.

"The A B C of Electricity." Price, 50c. The Motor World Publishing Co., 154 Nassau Street, New York City.

REFUSES TO EXTEND LIGHTS LAW

Massachusetts Legislative Committee Again Turns Down Bill Applying to All Vehicles—The Vote is Close.

Massachusetts is not ready to insist that all vehicles traveling on the roads at night shall display lights, but the opposition appears to be dwindling. The legislative committee on roads and bridges, following the example of the same committee of the two preceding legislatures, has reported "leave to withdraw" on the bill designed to make this requirement a law. It was hoped by those favoring the measure that, at the least, it would have succeeded so far as to be "referred to the next General Court," which would have prepared the way for broader consideration of the subject next year.

The adverse report by a majority of 7 to 4 was decided upon only after a very lively executive session of the committee, and when it had been put in and came up for acceptance or rejection in the House a motion was carried that it be assigned for consideration on Wednesday of this week. Meanwhile Representative Malley, one of the dissenting members of the committee, had drafted a bill to be offered as a substitute for the adverse committee report. This bill contains a number of exemptions, such as hand-propelled vehicles and wagons carrying loads of hay or other extremely inflammable material. It was also proposed not to require lights on vehicles in the streets of towns and cities which are well illuminated by street lights. These exemptions were designed to meet the most important objections to the bill brought out at the hearings, the city teaming interests being strongly opposed to being compelled to carry lamps on their vehicles, which almost never leave the lighted streets, and the farmers objecting on the ground of danger to carrying lanterns on hay wagons. Even if the proposition is turned down finally this year the automobilists will have the consolation of knowing that they are making progress, for never before in the past three or four sessions when the lights bill has been proposed has the measure secured so much support in the committee.

Stage Beauties Risky Passengers.

Many unforeseen difficulties and troubles have arisen in connection with the taximeter cab business, but a new source of worry has come upon those responsible for their operation by a legal decision in Paris which makes it ticklish business to have actresses as passengers. One of the beauties of the Opera Comique received a slight cut on the nose as the result of a cab mishap in which flying glass figured, and the resulting scar, though hardly discernible with a micrascope, won her 1,500 francs damages and put the chauffeur in jail.

DE PALMA MONOPOLIZES HONORS

Wins Seven Events at New Orleans Carnival and Breaks a World's Record—Burman Also a Record Breaker.

Ralph De Palma, the Brooklyn young man whose star has twinkled brightly in the firmament of automobile racing during the last two years, should have particularly good reason to congratulate himself. At the three days race meet which formed one of the features of the Mardi Gras celebration at New Orleans, La., on Saturday, Sunday and Monday, February 20, 21 and 22, De Palma won the seven events in which he was entered. Not only did the Brooklyn crack win every event in which he entered, but he broke the world's record for 10 miles, winning the ten miles handicap from scratch on Saturday in 9 minutes 11⅗ seconds. The old record was 9:12⅗, made by Barney Oldfield in New York City, October 29, 1904.

To tell the truth De Palma was far and away the "classiest" driver at the meet, and he had the fastest car. The affair was notable because for the first time in the history of the time-honored Mardi Gras carnival an automobile race meet has formed a part of the celebration; the mile fair grounds track in previous years has been the venue of horse racing.

The ubiquitous press agent naturally was on the job from the time the meet started until the curtain was rung down on Monday. When he wasn't joining in the revelries in town he was creating world's records in his fanciful brain, and the result was a record for almost every event. In spite of announcements of a score or more of records, including some "ladies records," whatever that might imply, only two marks were erased from the record table—the ten miles by De Palma and the 100 miles by Charles Burman, on the second day, Tuesday.

These so-called "ladies records" were, of course, scored by Mrs. Joan Newton Cuneo, the omnipresent "lady driver," who it is said, just dotes upon basking in the limelight of publicity. So long as Mrs. Cuneo confines her efforts to trials against time it was all right, but when she appeared in competition against men, Southern ideas of conventionality received a solar plexus knockout blow. All the shocks that could be produced by a combination performance of all New York's so-called prurient plays, Salome and Rajah dances, bronzed bare beauties and Maudeodellian dips in the bath would be mild in comparison to the shock that Louisiana's ideas of what constitutes ladylike deportment got when Mrs. Cuneo raced in competition against hired professional drivers.

Fair weather, a fast track that had been liberally sprinkled with oil, and a great outpouring of New Orleans residents and visitors marked the opening of the three days carnival on Saturday, 20th inst. It was expected that world's records would be knocked kite high at the very outset, but no records were touched until the very last event of the afternoon, when De Palma covered 10 miles in 9:11⅗.

The curtain was raised by a series of mile trials against the world's track record of 51 seconds, held by De Palma, but it was never in danger, De Palma himself making the fastest time in 54⅕ seconds. Seven drivers essayed the trial, but all of them fell short of De Palma's mark, he being the only one to get inside the minute. Mrs. Cuneo participated in this event.

In the ten miles trial against time De Palma, in his Fiat racer, attempted to lower the ten miles record, which then stood at 9:12⅗, but in the absence of competition, it was thought he did not extend his machine to the limit. The clockers gave him 9:17⅗ for the distance. Mrs. Cuneo then tried a five miles exhibition, the time—5 minutes 5 seconds—being gravely announced as a "world's ladies' record."

The five miles for gasolene stock cars included between the price limits of $750 and $3,000 was a disappointment as only one driver, Scheiffler, in a Jackson, finished. Burman, Lindrose and Schwartz broke down. No time was announced.

De Palma virtually had a walkover in the 50 miles free-for-all, finishing 1½ miles ahead of Mrs. Cuneo. Robertson, in the Simplex, had tire trouble and finished 4⅗ miles behind the winner. Strang withdrew before the finish. Despite the fact that De Palma's time, 51:37⅘, was announced as a world's record, history reveals the fact that the record for 50 miles is held by Oldfield in 48:40⅕.

The best race of the day was the 10 miles handicap, which came last on the program. De Palma started from scratch and he burned the oil in the first few miles overhauling all the other competitors. He finished a half mile ahead of Robertson and Strang, Ryall and Donnelly trailed in the order named. The time was 9:11⅗, which, as stated previously, is a new world's record.

Although the race proved uninteresting from a spectacular point of view the 100 miles stock car event on Sunday was easily the feature of the afternoon's program for the reason that Burman finished the century in 1 hour 42 minutes 39⅗ seconds, or 10 minutes 42⅖ seconds better than Jap Clemens' record made at Indianapolis, November 4th, 1905. Only three drivers started in the event—Robertson, Burman and Strang, the first named nosing a lead for less than a lap. Burman then went to the front and remained there throughout the race with the exception of one lap. In the 74th mile Strang was forced to stop for the second time because of a wobbly steering gear and he did not continue. Burman's driving was cleancut throughout and was particularly commendable in the last 25 miles, which he covered without goggles, having lost them in the last quarter distance. Robertson finished the race, but about ten miles behind Burman.

The second day's meet certainly showed that amateurism, if such a thing does exist in the nenets of the American Automobile Association, is in a sadly muddled state of definition. Despite the fact that Mrs. Cuneo had the day before competed in two professional races she was allowed to enter what was styled the "five miles national amateur championship for the Klaw and Erlanger trophy." Mrs. Cuneo won in 5:08, with Donnelly, in a Packard car, second.

De Palma made a runaway of the ten miles free-for-all race, winning by nearly three minutes over George Robertson, in 10:03⅗. Burman was third. Although he bettered his previous time De Palma could not reduce the world's record of 51 seconds for the mile, the timers giving him 52⅘ seconds. Burman did a lap in 58⅗ seconds, and later in the afternoon Mrs. Cuneo did a lap in 1:00⅕. She also beat Donnelly in the 10 miles for stock cars. A local rider named Jensen was the only finisher in the five miles motorcycle event, covering the distance in 6:22⅗.

The same pitiable state of amateurism was observed on Monday, the closing day of the meet. After competing in the professional free-for-all, Mrs. Cuneo won a five miles misnamed amateur stock car event, also competing in five miles professional free-for-all, and a ten miles professional handicap.

The 50 miles free-for-all, which went to De Palma in the fast time of 49:52⅗, shared honors with the 10 miles handicap as the feature events. In the 50 miles contest Strang appeared to be the only driver that could give De Palma a fight. Strang started from scratch in the 10 miles handicap, allowing Robertson 45 seconds and Strang, Burman and Mrs. Cuneo 50 seconds. This was the most exciting event of the afternoon as the cars changed places continually, Strang winning in the last half, after passing Mrs. Cuneo, who had held the lead up to this time. The summaries:

First Day—Saturday.

One mile time trials—Ralph De Palma, Fiat, 0:54⅕; James B. Ryall, Matheson, 1:01; George Robertson, Simplex, 1:01⅗; Mrs. J. N. Cuneo, Knox, 1:02⅕; Scheiffler, Jackson, 1:02; Lewis Strang, Isotta, 1:02⅗; Donnelly, Packard, 1:04⅘.

Ten miles against time—By Lewis Strang, Fiat. Time, 9:17⅗.

Five miles against time—By Mrs. J. N. Cuneo, Knox. Time, 5:05.

Five miles for stock cars selling between $750 and $3,000—Won by Scheiffler, Jackson. Time not announced.

Fifty miles free-for-all—Won by Lewis Strang, Fiat; second, Mrs. J. N. Cuneo, Knox; third, George Robertson, Simplex. Time, 51:37⅘.

Digitized by Google

Ten miles handicap—Won by Ralph De Palma, Fiat (scratch); second, Lewis Strang, Isotta; third, Ryall, Matheson; fourth, Donnelly, Packard. Time, 9:11⅘ (world's record).

Second Day—Sunday.

Five miles "amateur championship"—Won by Mrs. J. N. Cuneo, Knox; second, Donnelly, Packard. Time, 5:08⅕.

Ten miles free-for-all—Won by Ralph De Palma, Fiat; second, George Robertson, Simplex; third, Charles Burman, Buick. Time, 10:03⅗.

One mile time trials—Ralph De Palma, Fiat, 0:52⅘; Robert Burman, Buick, 0:58⅗.

Ten miles, Klaxton trophy for stock cars—Won by Mrs. J. N. Cuneo, Knox; second, Donnelly, Packard. Time, 10:12⅕.

Five miles for motorcycles—Won by Jensen. Time, 6:18⅗.

One mile exhibition—By Mrs. J. N. Cuneo, Knox. Time, 1:00⅕.

One hundred miles, free-for-all—Won by Charles Burman, Buick; second, Robertson, Simplex. Time, 1:42:39⅘ (world's record).

Third Day—Monday.

Five miles for stock cars—Won by Burman, Buick; second, Scheiffler, Jackson. Time, 5:40.

Five miles free-for-all—Won by Robertson, Simplex; second, Burman, Buick; third, Mrs. J. N. Cuneo, Knox; fourth, Strang, Isotta. Time, 5:07.

Five miles against time—By Mrs. Cuneo, Knox. Time, 5:05.

Five miles for "amateurs"—Won by Mrs. J. N. Cuneo, Knox; second, Donnelly, Packard; third, Schieffler, Jackson. Time, 5:15⅗.

Ten miles free-for-all handicap—Won by Ralph De Palma, Fiat (scratch); second, Mrs. J. N. Cuneo, Knox (0:50); third, Strand, Isotta (0:50); fourth, Robertson, Simplex (0:40); fifth, Burman, Buick (0:50). Time, 9:12⅕.

Fifty miles free-for-all—Won by De Palma, Fiat; second, Strang, Isotta; third, Robertson, Simplex; fourth, Mrs. Cuneo, Knox. Time, 49:52⅗.

Pathfinder for Glidden Tour Selected.

Although the opening of the bids for the supplying of a pathfinding car to pioneer the route for the forthcoming Glidden tour took place on Tuesday of last week, 16th inst., it was not until early this week that the result was announced, when it was stated officially that the honor had been achieved by the Everitt-Metzger-Flanders Co., as highest bidder on the list. The route is to be laid out earlier in the season than has been the case when the tours have been held in the East, it is said, because the western roads dry up more quickly in the spring. As to the exact course to be followed, however, the contest board of the American Automobile Association is discreetly non-committal, explaining that it is better not to announce the route until hotel arrangements have been completed.

A. A. A. SANCTIONS TO COME HIGH

Preliminary Steps Taken in Establishing New Method of Racing Control—Uniform Entry Blank Adopted.

The dregs are beginning to settle out of the racing muddle and prospects for absolute clarification in the near future are very bright indeed. If in the process of rectification, "individuals with personal grievances, or promoters whose plans may not harmonize with the new order of affairs" are moved to criticise the new method of racing control which now is vested in the contest board of the American Automobile Association and its advisory committee of the Manufacturers Contest Association, such criticisms are but the inevitable symptoms of internal friction attending any important reaction. The contest committee with its moral background has now assumed full control of the situation and is proceeding with a reorganization of the realm of automobile racing.

At a meeting of the contest board and advisory committee, held on Monday of this week, and reconvened on Tuesday as well, preliminary steps looking toward the upbuilding of a real government of sport were taken. Without delay, a new schedule of sanction fees was adopted, which, however, repeats the fault of the former tariff by setting the fees so high that sport promotion is not encouraged, but wet-blanketed, since the small club or small promoter in a small town will be scared off by the prices exacted, which are as follows:

Road race, where a stand is erected...	$300
Track meeting	100
Track meeting, including 24 hours event	250
Hill climb	50
Endurance contest	50
Road and beach speed trials	100

All clubs affiliated with the A. A. A. are entitled to a 50 per cent. reduction from these rates.

It also is explained that the Glidden tour is not affected by the terms of the agreement between the A. A. A. and the manufacturers, and further that no sanction will be granted for a long distance road reliability contest within a month of the duration of the Glidden contest. A uniform entry blank for application for sanction has been adopted, and the proviso established that all entry blanks shall be uniform for corresponding events. Furthermore, every entry blank must contain the words: "Under the sanction and rules of the American Automobile Association." Defining the object and powers of the new government, the following official statement has been sent out by the A. A. A.

"The purpose of the new arrangement is to advance uniform and rational conditions in contests, at the same time vesting control in a body having national club affiliations; and to ensure that adequate care be taken in granting sanctions for contests and that the same be carried on fairly and efficiently, prizes being guaranteed by those in immediate charge of contests, and trophies with valuations attached being appraised with integrity. It must be proved to the satisfaction of the board that trophies or cash prizes, as advertised, will be awarded promptly. And when values are stated, the awards are to be in cash or plate, at the option of the winner. The different districts of the United States and its possessions will each be represented by an Association member of the contest board, his duties being to keep the board advised of contest matters in his district."

Quaker City Club Loses on Appeal.

Official ratification of the agreement between the American Automobile Association and the newly formed Manufacturers Contest Association was formally enacted at a meeting of the executive committee of the A. A. A., held in New York yesterday, 24th inst. Another action of considerable interest, though of less general moment, was that taken in regard to the protested decision of the contest board in the matter of the triangular dispute between the board, the Quaker City Motor Club, and the Premier Motor Mfg. Co. On protest from the Premier company the contest board reversed the decision of the Quaker City Club's officials in disqualifying the former's car which participated in the New Year's day endurance run from Philadelphia to Wilkes-Barre and return, thereby awarding the trophy to that car. The Quaker City Club promptly appealed to the executive committee of the A. A. A. claiming that the contest board was without jurisdiction in the matter. On appeal, however, the club loses its case, and the decision of the contest board is "unqualifiedly sustained." This confirms the Premier as winner of the race. At the meeting it also was decided to hold the first quarterly meeting of the 1909 board of directors in Boston, on March 11, the meeting place not designated.

Stringent Rules for German Tour.

The premier of German motor car events for 1909, the Prince Henry tour, will be held June 10 to 18, inclusive, under the management of the national governing body, the German Imperial Automobile Club. Only four and six cylinder cars are eligible whose engines are within the minimum and maximum limits of 7 and 28 horsepower, respectively. The rules are of a stringent nature. All cars must have seating capacity for four, and must be fitted with two independent brakes. Mufflers must be used, three lamps are called for, and a sprag must be included. Cars are to be equipped with speed indicators and the use of any fuel other than gasolene is prohibited. Entries close April 1st, but on the payment of a double fee, may be made as late as the first of May.

CONCERNING CONTROL OF SPORT

Wherein the A. A. A. Might Learn from the Motorcyclists—Value of Consistent Rules Consistently Enforced.

"When I think of the way the American Automobile Association has handled automobile sport and compare it with the manner in which motorcycle competition has been governed by the Federation of American Motorcyclists, I have to laugh in my sleeve," a few days since remarked a man who is familiar with both of these comparatively new sports, which generally speaking have much in common.

"While the A. A. A. has enforced its rules only when it felt like it, which was not as often as should have been the case, or when the enforcement would not offend a club or anyone of prominence in the trade, the motorcycle organization has adhered to its regulations with praiseworthy consistency and without regard to whom the adherence affected. No man's prominence or trade connection has served to save him from discipline. It has not hesitated to declare that having competed with professionals even W. K. Vanderbilt, Jr., would not be accepted as an amateur motorcyclist, which recalls the remark of one of the A. A. A. satellites after a meeting of the racing board at which one of the members dared express disagreement with some of Vanderbilt's opinions. 'Why,' in a most surprised tone said that satellite, who apparently is awed by the millionaire's great wealth, "—— actually opposed Mr. Vanderbilt's ideas.'

"While the A. A. A. has temporized and backed and filled or remained blind when automobile manufacturers or manufacturing interests were concerned, the F. A. M. did not wait or ask for the appointment of a trade committee to define its duties or to suggest or shape its rules. At the very outset it realized that freak machines or machines of abnormal power were dangerous and undesirable and would restrict competition and it therefore set a limit of 5 horsepower, more than which was not permitted to be used. When the manufacturers commenced underrating their power, the F. A. M. met them more than half way and wiped out the horsepower limitation and substituted one of 61 cubic inches piston displacement which permits of no evasion or stretch. To-day there is not a motorcycle built that exceeds that capacity; the single cylinder machines are all of 30½ cubic inches or less and the twins of 61 cubic inches or under. No manufacturer even thinks of producing an engine exceeding the F. A. M. limit. The few freaks that were in existence have been rendered practically valueless except as junk. They are not permitted in a race or contest of any sort and whenever their owners let them out on the Ormond beach, for instance, they know full well that any achievement they may make will go for naught since it will not be accepted or recognized as a record. When riders began using the big 61 motorcycles on half mile horse tracks, and accidents resulted, the F. A. M., unlike the A. A. A., did not shirk responsibility or wash its hands of that form of sport. It simply prohibited the use on such tracks of machines exceeding 30½ cubic inches.

"There was one motorcycle manufacturer who kicked over the traces several years ago. He became offended at some ruling and grew so warm that he organized a little association of his own with a high-sounding national title. He adopted officers and a set of rules and attracted a number of soreheads who had been disciplined by the F. A. M. But that organization did not grovel or temporize. It gave the disgruntled manufacturer a jolt that he was not expecting. Formal charges of disloyalty and conduct prejudicial to the interests of the F. A. M. and of the sport were preferred against him and also against his sales manager. The former was expelled from the organization and the latter was suspended for a term of years. Later these people ran several race meets under their own 'sanction.' The F. A. M. treated them as 'outlaws,' and suspended every man who competed, most of them being employes of the manufacturer in question. When they permitted a couple of professional cyclists to enter their events they all were declared professionals and when these professionals next tried to compete on bicycles, they found that the bars were up against them and got down on their knees and pleaded for forgiveness. At a later day, when the 'outlaws' in an effort to pave the way for peace, sought an F. A. M. sanction, it was refused. The manufacturer in question also built his machines in excess of the F. A. M. limitations of 30½ and 61 cubic inches. As a result none of his customers could make use of them in contests sanctioned by the F. A. M., which meant practically all open contests. The answer was not long in coming. To-day that man's productions all are within the official measurements, and there is not enough left of his 'national association' to be recognized with a spy glass, and no other manufacturer is disposed to create a fuss of any sort.

"There was another occasion when several 'stars' of the track—all of whom were engaged in the trade—went on a 'strike' because something or other did not please them, and because the F. A. M. officials refused to reverse their attitudes. They were backed up by their employers. But this 'strike,' too, was promptly met. The contest was immediately eliminated and another substituted and when the 'strikers' trotted out to participate they were told they were not wanted and were ordered off. The 'strike' collapsed on the spot. There never has been another one.

"If there is any man who can testify to the quality of F. A. M. control, it is Ralph De Palma, who now is starring as an automobile driver. Early in his career as a motorcyclist, De Palma committed a brazen offense for which he was ruled off the track for an indefinite period. After remaining quiet for a short while, he began trying to secure reinstatement. He begged and pleaded and promised, but to no purpose. He had his club pass resolutions and write letters in his favor, but as it did not help him, he induced a manufacturer to espouse his cause and indite some threatening communications. The manufacturer was given some plain spoken advice and De Palma remained on the shelf. In despair, he rode an exhibition mile at an 'outlaw' race meet. When next he approached the F. A. M. he was told simply that having played with the outlaws, he must keep on playing with them. But Ralph was ambitious to drive a racing car and he thereafter remained so well on his good behavior and was so penitent, that finally he was reinstated. He was kept off the track, however, for nearly five years.

The F. A. M. rules requiring the sanctioning of all contests has been lived up to, not occasionally, or only in prominent instances, but all the time. Events are followed up and when they are unsanctioned, the men who compete in them are suspended. The same is true of non-registered riders, although their first offense usually is forgiven. For the F. A. M. requires each competitor to become possessed of a registration card, which as the A. A. A. some day may discover, is the only way to keep track of contestants. The promoter, too, has been made to realize his obligations. Only a few months ago one of them, with a big race meet on tapis, had his track suspended. It brought him to time in a hurry. There was another promoter who, at a mixed meeting palmed off a 'ringer' on the public. As a matter of courtesy the F. A. M. left his punishment to the other organization, which for the sake of expediency sought to overlook the miserable offense. After several months this promoter applied for an F. A. M. sanction. He was told that instead of getting a sanction he would be ruled off the track if he did not at once call on the other organization to decide his punishment. Within 24 hours he mailed the F. A. M. a receipt for the fine that was imposed on him and was profuse in his promises to 'be good' evermore.

"The F. A. M. amateur rule is a real amateur rule, also. No man who competes for cash or against professionals in any sport can remain an amateur. An American motorcyclist who went abroad last year and did that sort of thing over there where there is no amateur rule, found himself in the professional ranks soon after his return, and despite his threats of legal proceedings.

"The motorcycle organization's rules define exactly what constitutes an endurance or reliability or economy contest, or a hill climbing contest, and in the annual national

Digitized by Google

endurance contest there has been little of that friction which has followed nearly all of the Glidden tours. In these national contests, the F. A. M., unlike the A. A. A., has not overlooked the private owner. There is a separate class and separate awards for him each year. The trade is not permitted to monopolize everything, and the result is apparent.

"It probably will be news to very many automobilists that their organization has anything to learn from the comparatively little known motorcycle body, but if it is not too blind or too proud, the A. A. A. can learn how truly to control sport and to assure a square deal to all and thus merit the respect and support it always has lacked because of the nerveless and shilly-shally policy. I have some reason to believe that there are several officials in the A. A. A. who are not wholly unfamiliar with the way the motorcycle organization does things," concluded the speaker with a smile, "for if I mistake not there have been several occasions when to apply the screws to offending motorcyclists it has been necessary to call on the A. A. A. to enforce the alliance existing between the two bodies; and to the credit of the A. A. A. it is to be said that when thus prodded it usually acted promptly and with decision, although the referees of several A. A. A. events appear not to know the meaning of an alliance and have feared to enforce it. The other organization has been not less prompt when conditions were reversed, and the A. A. A. has called on it to enforce the terms of the treaty."

Fort George Hill Climb Plans Revive.

Undismayed at the repeated postponements and final annulment of its dragged-out scheme for a hill climb on the tortuous Fort George hill, New York City, last election day, the New York Automobile Trade Association has bravely come forth with the announcement of another project of the same sort—otherwise, its "second semi-annual hill climb up Fort George hill—which is scheduled to take place on Saturday, April 10th. The same rules which were proposed for the postponed and abandoned event will be in force, under a classification which probably will be by price and horsepower.

Mountainous Route for Two Days Run.

Flushed with the success of its efforts in the promotion of the run from New York to Montauk Point and return of last fall, and touched by the appreciation of the contestants at the tender solicitude with which the active management looked after their welfare, the New York Automobile Trade Association is contemplating another attempt along similar lines, for the early summer. A two-day tour and reliability contest up the west shore of the Hudson into the Catskills, across into the Berkshires and back to New York, is the outline thus far developed.

"SENATOR" MORGAN GETS RILED

Proposed Enforcement of A. A. A. Racing Rules the Cause—He Threatens to Call Off the Florida Sandfest.

With its backbone stiffened by new resolution and courage as faras racing is concerned, the American Automobile Association has taken a hand in the Florida beach races to be held in Daytona March 23-26, and has aroused the resentment and ire of W. J. Morgan, the promoter, by insisting upon the strict observance of its latest rules and regulations, which among other things compels the posting of prize money in advance, to make sure that it will be obtainable when it is won. Morgan does not openly object to such rules, but resents being made the first to have to observe them, and he kicks back at the Association by declaring that it should first remember the past and collect the non-appearing prize money that the victors in the Brighton Beach and other affairs did not get although the promoters had A. A. A. sanction.

Morgan is peeved, also, over the fact that the A. A. A. has raised objections to granting a sanction for the race to the Florida East Coast Automobile Association on account of the latter's delinquencies as to its A. A. A. dues, and he does not like to have the A. A. A. contest board change the wording on his entry blanks concerning the part that the Florida association is credited with in the affair. So wrought up was he this week that he even came out with an interview—in a paper other than that for which he regularly writes, however—stating that because of his trouble with the A. A. A. he probably would call off the whole Florida project, and then maybe they'd be sorry. The likelihood of this action on his part is expressed by the colloquial phrase, "What a chance!"

Chicago's Race Dream Materializing.

With the addition of a light car race to the program thus forming the nucleus for a two days instead of a one day affair, and the selection of May 28 and 29 as tentative dates, members of the Chicago Automobile Club are much encouraged at the prospect of securing their long cherished desire of a stock car race of some little magnitude and importance. After trying for months to secure the race for the Jefferson De Mont Thompson trophy, president Ira M. Cobe, of the Chicago club, forever settled the difficulty by offering the Cobe trophy for competition. After extended conferences with Chairman Hower of the contest board of the American Automobile Association and others, the outlines of the plan have been determined upon and the tentative announcements made. It is probable that the Lake County, Ind., course, which was selected last fall at the time of the agitation for the Thompson stock car race, will be used, as it offers many advantages for the purpose of a hotly contested orad race.

Cars Selected for the White House.

Following the recent heated debate in the Senate and House over the so-called Urgent Deficiency bill, which contained an item of $12,000 for automobiles for the President of the United States and a smaller item for the vice-president, Secretary of State and the Speaker; and the subsequent ratification of that portion of the measure, considerable interest has been aroused as to what manufacturer would secure the honor of being first to supply a car for the use of the nation's chief executive. Naturally competition was of the keenest, and it goes without saying that there is much elation in the White camp since it was made known this week that President-elect Taft had selected a White steamed for his own use.

For the securing of the order no small credit is due to the activities of G. W. Bennett, Eastern manager for the White Co., whose efforts in Washington thus are rewarded for the third time, the Eastern branch recently having delivered two other cars to government officials, one a limousine, to General J. Franklin Bell, Chief of Staff, and the other, a Model "M" touring car to the War Department.

In the matter of supplying a closed car for the use of the "first lady of the land," as well as for service during inclement weather, the Pierce-Arrow Automobile Co. has been equally honored and will furnish a six-cylinder Suburban car. Both machines will be finished in special colors, and each will bear a reproduction of the great seal of the United States.

Apperson Wins Again at Pasadena.

Despatches from Pasadena, Cal., announce that the Altadena-Pasadena hill climb—the "blue ribbon" event among Pacific Coast contests—which was held on Tuesday, 22d inst., was won for the second time by Edgar Apperson, driving an Apperson "Jackrabbit" stock car, who made the ascent from standing start in 1:24. Barney Oldfield, driving the Stearns, was second, making the climb in 1:29½. A Stoddard-Dayton came in third in 1:36⅗. Apperson's performance this year was 13½ per cent, faster than that of a year ago, when his time was 1:36⅕.

Big Rake Off for Savannah Races.

According to a statement issued by the executive committee, the promotion of the international races last Thanksgiving Day by the Savannah Automobile Club, was attended with very satisfactory financial results. After all obligations against the club had been met, it was found that a balance of $20,000 remained.

A portion of the money will be used to exploit the advantages which Savannah offers to the outside world, but the major portion of the sum will be retained to form a nucleus for another race.

AMERICAN CARS BEST FOR SPAIN

Their Superiority to European Product in Adaptability and Price—Broad Possibilities of the Market.

Favorable prospects for the successful competition of the American product with the European automobile in the Spanish market, are outlined by Consul-General Frank D. Hill, of Barcelona. Quoting from the special report of the manager of an important garage in Mexico, he states the writer's conviction after several years' experience, that American cars are superior to the foreign product in general. With regard to the opening in Spanish territory Consul-General Hill proceeds:

"In the first place the American car is carefully designed for travel over poor roads, many of those in Spain being in a deplorable condition. The American chassis is wonderfully strong, of great resistance, and high enough to permit passing over stones projecting 8 or 9 inches. As a rule European cars are built very low, the tendency being to increase the stability in this manner. The hang of the American car is superb, incomparably superior to that of the European, and in addition to numerous other advantages it possesses the most appreciable one of cheapness.

"The cost of an American car is, in proportion, greatly inferior to that of any European make. For example, an average American car, 30-32 horsepower, equivalent to a French 16-20, with double phaeton tonneau, searchlight, lanterns, horn, cushions, hood, etc., well appointed in every respect, costs $2,800; while the French car 16-20 costs $3,184, leaving a difference of approximately $400 in favor of the American car. To this should be added the 20 per cent discount granted by American manufacturers, with the result that the net price of a completely equipped car is $2,240. Of course, freight charges and customs duties increase the prices shown, but these are practically the same for European as for American cars.

"The American cars best adapted to conditions in Spain are first class makes, ranging from 40 to 65 horsepower, and costing from $4,000 to $5,000; second class, small touring cars of 20 to 40 horsepower, ranging in price from $1,500 to $3,000; and runabouts for business men, doctors, brokers, agents, etc., at a cost of $850 to $1,000. These little cars present great advantages for Spain, being convenient, inexpensive, easy to run, and good hill climbers.

"Excellent opportunities are offered to American makers of tires and accessories, owing to the good quality and cheapness of their products.

"A set of American tires was tried in Barcelona and lasted exactly one year, in spite of continuous daily use on a car weighing 1,600 kilos (3,520 pounds). It is difficult to cite a similar example. Aside from their cheapness, accessories of American manufacture are to be recommended for their perfection and convenience, American makers progressing rapidly in this branch.

"Drays and trucks for commercial use are unknown in Spain, and their introduction would undoubtedly be facilitated by familiarity with American systems, which are much cheaper than those imported from France or manufactured here.

"Should American manufacturers care to exploit an excellent market, they ought to organize a permanent exposition in Barcelona. A stock of most improved models should be kept on hand, supplemented by tires and accessories of every description."

Legalizing Safeguards in Contracts.

Possibility of fires, strikes, accidents and other misadventures affecting the fulfilment of agreements or contracts has led many automobile manufacturers to place on their letterheads and contract blanks a notice that such statements or agreements as they make are contingent upon conditions of this kind, but according to later court decisions and interpretations, such notices are of no legal effect or relief when they are not incorporated between the beginning of a letter or contract and the closing signature. To meet the situation, at least one automobile manufacturing company has adopted the ingenious expedient of placing the printed notice on its letter heads across the writing space at a point just below the place for the date line and the opening address, so that the notice, although in type sufficiently small to be unobtrusive, practically constitutes the first paragraph of the body of the communication. Some comment has been caused by the appearance which such letterheads present, but the wise legal ground for the practice will doubtless recommend it.

Where the British Patent Law Hurts.

"Taking the United Kingdom as an entirety, it would seem that the number of American manufacturers who have protected themselves by complying with the provisions of the law is very considerable, and represents a large amount of work taken from American workmen," says Consul Albert Halstead, of Birmingham, in regard to the observance of the British Patent and Design Act of 1907, which requires foreign patents to be worked wholly or adequately in the United Kingdom if they are to be protected by British patent laws. "But there must be a far greater number," he continues, "who have overlooked the importance of so doing, and who are thus risking the forfeiture of their patents and the manufacture of their articles in the United Kingdom by British firms and without compensation, even though their articles have not as yet been introduced into this market, because the British manufacturers are very well contented with the new law and are watching keenly for all such opportunities."

WHEREIN JAPAN ADVANCES SLOWLY

French Exploitation of the Motor Vehicle Strikes a Snag—Cheap Coolie Labor Hampers the Enterprise.

Seeking new markets and outlets for their products, French manufacturers of commercial motor vehicles are giving evidence of fostering the development of automobile transportation lines in foreign countries, Japan being the latest scene of endeavors in this direction, according to Vice-Consul-General E. C. Babbitt, of Yokohama. That such enterprises do not meet with uniform success is the opinion of the observers with whom he has come in contact.

"There was recently organized in Tokyo," Babbitt explains, "a transportation company for the purpose of transporting passengers and freight throughout the city. The capital of the company is 500,000 yen ($249,000), of which one-fourth has been paid in.

"The intention was to start business with 20 motor cars, and a number of these have been ordered from France through a local business house. It is understood that a firm in Paris is supplying the cars, at an average cost of $3,000 gold. Five of these cars have recently arrived and undergone successful tests; two of them are for passengers carrying six persons each, and the others light delivery trucks of a loading capacity of 1½ tons.

"Transportation of goods by automobile is a comparatively new undertaking for Tokyo. Several of these light delivery trucks and vans have been used in Tokyo by private companies, but the fact that no orders were repeated is evidence that they were not considered economical or capable of competing with the cheap coolie labor that so largely takes the place of horse or mechanical transportation in Japan.

"American manufacturers should not become possessed with the idea that they can send catalogs over here and receive orders and remittances by return mail; the Japanese want to see what they are buying. It appears that the present undertaking is rather a venture on the part of the French manufacturers and the local agent; that the success of the new transportation company is problematical; and that the cost of the machines, with 50 per cent. ad valorem duty, with cost of operating and repairs, may take more than the profits of a business which is not assured them."

Cork Bullets to Stop Scorchers.

Cork bullets for stopping speeding motor car drivers have been devised by a French inventor, who claims that they will frighten and stop a reckless chauffeur almost as effectively as real lead. Beyond their ability to draw blood or knock out an eye, they are represented as harmless, but the specified capacity to hurt is quite sufficient.

The Week's Patents.

902,250. Emergency Repair Device for Vehicle Springs. Dudley P. Power, Rivervale, N. J. Filed Nov. 10, 1906. Serial No. 342,911.

1. The combination with a vehicle body spring and axle clip, of reinforcing means comprising spring engaging devices arranged at opposite sides of the clip, and a non-resilient member interposed between and connecting said devices.

902,276. Tire Protector. Francis G. Crone, Buffalo, N. Y. Filed Sept. 11, 1905. Serial No. 277,959.

1. The combination with a vehicle wheel and a tire attached thereto of a tire protector comprising a plurality of circular plates provided with peripheral tread surfaces and means for rigidly securing said plates to said wheel so that the periphery of said plates may bear any predetermined relation to the periphery of said tire.

902,350. Engine Starter. Louis S. Tuttle, Eastport, N. Y. Filed April 11, 1907. Serial No. 367,498.

1. In a starting device for internal combustion engines, the combination of a crank provided with a handle and having means adapted to engage with a shaft in starting the engine, a bolt slidably mounted on the crank for locking it to said means, and means normally engaging the said handle adapted to automatically release the bolt from said first-named means when the resistance of the shaft to the crank reaches a predetermined point.

902,427. Electric Sparking Device. Willie H. R. Mildebrath, Jacksonville, Fla. Filed Jan. 20, 1906. Serial No. 297,032.

1. A spark plug comprising a stationary electrode, a rod mounted for longitudinal movement, one end constituting a movable electrode normally separated from the other electrode, a body of metal fixed on the rod and forming an armature, an electro-magnet surrounding the rod and operating on the armature to bring the electrodes into contact, a yielding element arranged to hold the electrodes separated, a binding post against which the rod is held by the said element and adapted to be connected with a high tension circuit, and means for connecting the electro magnet with a low tension circuit, said rod and binding post forming a path for high tension current when the electro magnet is out of service.

902,383. Vehicle Wheel. Alvin A. Daugherty, New York, N. Y. Filed Jan. 5, 1907. Serial No. 351,023.

In a vehicle wheel, a series of flat spokes, a hub therefor, said hub having pockets and slots merging therewith, said spokes having their ends provided with cylindrical heads to fit in said pockets, with the spokes projecting through said slots, means for holding said spokes in the slots and pockets, said means comprising a web integrally formed with the hub, a plate removably secured to the hub over the spoke ends, said hub having slotted portions between the spoke slots, and bolts passing through said last named slotted portions and the plate, for securing the plate in position.

902,515. Friction Clutch. Martin L. Williams, South Bend, Ind. Original application filed Dec. 26, 1905, Serial No. 293,290. Divided and this application filed Dec. 7, 1906. Serial No. 346,769.

1. In a power transmission mechanism, a friction clutch mechanism comprising a gear body, a circular casing mounted on one side of said gear body, and provided at its outer edge with a closed side portion centrally apertured, a plurality of supporting rods arranged near the periphery of said casing, each rod having its ends seated respectively in the gear body and in said side portion, and all arranged to extend through said casing parallel with the axis of the rotation of the gear body, a set of friction discs, each having its periphery suitably apertured and movably fitted upon said supporting rods, a second gear body mounted concentric with the first gear body, a tubular supporting member mounted upon said second gear body and extending freely through the aperture in said circular casing member, and provided at its end remote from the second gear body with an annular out-turned flange, a set of supporting rods mounted adjacent to the periphery of said tubular member, each of said rods having its ends seated in the second gear body and in the annular flange of the tubular supporting member, a set of friction discs, each being suitably apertured and movably fitted upon said second set of supporting rods, the peripheral portions of said latter discs being interposed between and alternated with the perimetral portions of the first set of discs, and means for bodily shifting one of said gear bodies and the supports carried thereby axially from and toward the opposite gear body, whereby said friction discs are brought into, or carried out of, bearing engagement with each other.

902,522. Electric Circuit Controller for Internal Combustion Engines. Charles Cuno, Oconomowoc, Wis., assignor to Connecticut Auto Engineering Corporation, Meriden, Conn., a Corporation of Connecticut. Filed Sept. 19, 1906. Serial No. 335,176.

1. In a device of the character described, a shaft, a contact arm carried thereby, a case including a removable part, bearings between the case and said shaft and arranged on opposite sides of the contact device, contact blocks carried by but insulated from said case and arranged in the path of the contact device, external terminals for said blocks and an adjusting device for said bearings, said adjusting device being carried by said removable part of said case.

902,523. Flexible Driving Mechanism. William Dalton, Schenectady, N. Y., assignor to American Locomotive Company, New York, N. Y., a Corporation of New York. Filed May 8, 1908. Serial No. 431,688.

1. In a driving mechanism, the combination of a driven member, a driving member, fitted with the capacity of independent circumferential movement thereon, a plurality of abutment blocks engaging the driving member, and springs interposed between said abutment blocks and bearing thereon and on the driven member.

902,550. Universal Joint. Maurice E. Blood, Clarence C. Blood, and Howard E. Blood, Kalamazoo, Mich., and Charles W. H. Blood, Winthrop, Mass., assignors to Blood Brothers Machine Company, Kalamazoo, Mich. Filed July 10, 1908. Serial No. 443,002.

1. The combination with a coupling shaft of a pair of socket coupling members, each comprising a shell having internal longitudinal groove-like seats therein, a pair of spline-like bearings having beveled ends arranged in said seats, an end piece adapted to be secured to a shaft to be coupled, threaded into the outer ends of said shell, said end piece having seats in its inner face in which the ends of said bearings are arranged, a clamping ring having seats therein adapted to receive the outer ends of said bearings, and a clamping nut for said ring threaded into the inner end of said shell; and a pair of coacting coupling members, each comprising a head secured upon the end of said coupling shaft, said head having cylindrical bearing seats therein, and forked bearing blocks arranged in said seats to engage said socket bearing members, said bearing blocks being curved to bear on the edges of said socket bearing members, the bearings of one of said socket members having curved seats in their edges for the coacting bearing blocks, whereby longitudinal movement of the parts relative to each other is prevented.

902,558. Speed Controlling and Reversing Apparatus for Motor Vehicles. Harry T. Coldwell, Newburgh, N. Y. Filed Dec. 24, 1907. Serial No. 407,955.

1. The combination with axially aligned driving and driven shaft sections, of a plurality of gears on the driving section, auxiliary shafts supported parallel to and stationarily with respect to the aligned shafts, a sliding gear on each of said auxiliary shafts, normally out of operative relation with any of the gears on the driving section, means for connecting each of said sliding gears with a gear on the driving section and means for connecting each of said sliding gears with the driven section, substantially as described.

902,560. Speed Controlling and Reversing Apparatus for Motor Vehicles. Harry T. Coldwell, Newburgh, N. Y. Filed Feb. 12, 1908. Serial No. 415,544.

1. In a controlling device for motor vehicles, the combination with a single shifting device, of a single operating lever, pivotally mounted so as to be capable of lateral and back and forth movements, a guiding plate engaging one end of the lever and provided with longitudinaliy disposed slotted portions, in different transverse planes, and connected by transversely disposed slotted portions, the lower end of the lever engaging said shifting device, the engaged portions of said lever and shifting device, permitting the lateral movements of the lever from one slot section to any other slot section without disengagement of said parts, substantially as described.

902,583. Lubricator. John C. Hill, Chicago, Ill. Filed April 17, 1908. Serial No. 427,620.

1. In a lubricant, the combination of a pump casing formed with a series of pump chambers having inlet-outlet passages at one end, a series of plungers in said pump chambers, a valve member formed with an inlet and an outlet passage for each of said pump chambers, the means for reciprocating said valve, the inlet and outlet passages of the valve being arranged in groups having a reversed relation.

902,644. Connection for Inflating Tires. Wyatt Boyd, Sabina, Ohio. Filed Oct. 29, 1907. Serial No. 399,755.

1. A connection for inflation valves comprising a supporting bracket having means for attachment to a vehicle wheel and provided with an annulus, and a fluid conducting tube extending through said annulus and having one end thereof secured to the valve and its opposite end connected with a source of fluid supply.

902,692. Motor Carriage. John C. Sher-

Digitized by Google

man, Brookline, Mass. Filed Aug. 21, 1905. Serial No. 274,977.

1. In a motor vehicle, the combination with a plurality of combustion engine units, of a common driven member, and driving connections between each of said engine units and said driven member, said connections being adapted to connect different engine units or different combinations of engine uits with said driven member, and a single controller for said connections.

902,693. Indicating Device for Use with Pneumatic Tires. Thomas Sloper and Robert Sloper, Devizes, England. Filed Oct. 5, 1907. Serial No. 396,079.

1. In a deflation indicator the combination with a road wheel of a vehicle and a non-rotating part of the vehicle, of a sounder carried by one of said elements, a striker carried by the other element and free to be advanced into the path of the sounder, means for normally retaining the striker free of the sounder, a pneumatic tire on the wheel, and means, adapted to be operated by excessive lateral deformation of the tire, for displacing the striker and moving it into the path of the sounder, substantially as set forth.

902,782. Ignition System for Explosion Engines. Richard Varley, Englewood, N. J., assignor to The Autocoil Company, a Corporation of New Jersey. Filed Oct. 1, 1906. Serial No. 336,859.

1. In an ignition system for explosion engines, rotatable means forming part of a single mass for closing the primary circuit at one point and for opening it at another point, and centrifugally operated means forming part of the same single rotating mass with said rotatable means, for varying the interval between such closing and opening with relation to the speed of the engine.

902,824. Vehicle Tire. Grant Lambright, Rutherford, N. J., assignor of one-half to Frank A. Magowan, New York, N. Y. Filed June 28. 1906. Serial No. 323,874.

1. A pneumatic tire for vehicles, comprising a single piece cover in whose base are included annular substantially unyielding strips, the walls of the cover including numerous plies of fabric, all of the plies in said cover being anchored separately upon said strips, single ply to each strip at each side of the tire.

902,856. Transmission Mechanism. Henry Cave, Providence, R I. Filed May 9, 1907. Serial No. 372,722.

1. An improved transmission mechanism comprising a driving shaft, a pinion keyed to said shaft, a second pinion adjacent the first pinion and free to rotate on said shaft, a driven shaft geared with the latter pinion, planetary gearing surrounding said driving shaft and formed of elongated gears engaging both of said pinions, and means for preventing planetary movement of said planetary gears, whereby the driven shaft will be rotated in a forward direction.

902,926. Vehicle Tire. James A. Swinehart, Akron, Ohio. Filed Jan. 31, 1906. Serial No. 298,746.

1. The herein described tire comprising a solid elastic body having its sides curved inwardly at the tread and terminating at the base of a pair of annular ribs, one adjacent to each outer side of the tread, said ribs forming a centrally located annular concaved groove, the groove and ribs being of substantially the same area in cross section whereby the height of the ribs and the depth of the groove are substantially the same.

902,937. Spring Construction. Charles Burgess, Jr., Wenona, Ill. Filed July 5, 1907. Serial No. 382,262.

1. In a spring construction the combination of an axle, a frame, a spring secured between its ends to said axle, one end of said spring secured to said frame, and a compression member comprising a casing having a square bore, pivoted to said frame and adapted to contain a liquid, and a piston provided with a square head within said casing having one of its ends secured to the other end of said spring, substantially as described.

902,944. Controlling Device for Motor Vehicles. Frank S. Davis, Toledo, Ohio, assignor to Pope Manufacturing Company, Jersey City, N. J., and Hartford, Conn., a Corporation of New Jersey. Filed Oct. 14, 1905. Serial No. 282,714.

The combination with a steering wheel for a motor vehicle of a sector mounted concentrically with the axis of the wheel and having its inner and outer lateral edges toothed or ratcheted controlling levers pivoted concentrically with the sector and a spring detent for each lever in the plane of the sector to engage the corresponding lateral edge thereof.

903,068. Vehicle Brake. Giovanni Enrico, Turin, Italy, assignor, by mesne assignments, to Fiat Automobile Company, a Corporation of New York. Filed Dec. 10, 1906, Serial No. 347,043. Renewed April 15, 1908. Serial No. 427,212.

1. In a vehicle brake mechanism, the combination with a brake member having a friction surface, of a fluid reservoir, brake applying connections, and means whereby an actuation of said brake connections permits the discharge of a quantity of fluid from said reservoir to cool said brake and automatically cuts off the flow, substantially as described.

903,080. Road Vehicle Wheel Axle. Luigi Granieri, Rome, Italy, assignor to The Firm of A. G. E. S. Societa in Accomandita Semplice per l'Esercizio dei Brevetti Granieri, Rome, Italy. Filed May 12, 1908. Serial No. 432,475.

1. Elastic axle-tree for road vehicle wheels such as described, comprising in combination axle journals, deformable pivoted parallellograms connected to the said journals, rigid angular extensions of the said parallelograms and elastic connection between the said extensions of the said parallelograms.

903,090. Dynamometer for Explosion Engines. Nevil M. Hopkins, Washington, D. C. Filed Feb. 12, 1908. Serial No. 415,571.

1. In combination with an explosion engine, a dynamometer, comprising a thermo-couple within the engine cylinder, means for maintaining said thermo-couple at a temperature below the ignition point of the explosive mixture, and an electric indicator connected to said thermo-couple.

903,122. Air Purifying Device for Automobiles. Herman E. Whiting, N. Y., assignor of one-half to Olin J. Garlock, Palmyra, N. Y. Filed March 4 1908. Serial No. 419,192.

1. An air purifying device for carburetters, the same comprising a casing having therein a dust-catching fluid, a fibrous body and a spring pressed removable perforated plate separating the two.

903,133. Controlling Mechanism for En-

gines. Giovanni Enrico, Turin, Italy, assignor, by mesne assignments, to Fiat Automobile Company, a Corporation of New York. Filed Dec. 10, 1906, Serial No. 347,041. Renewed April 15, 1908. Serial No. 427,210.

1. The combination with a rotating shaft and manual means including a resilient connection for cotrolling the speed thereof, of means co-operating with said resilient connection for rendering said manual means ineffective to increase the speed above a predetermined limit, substantially as described.

903,206. Mixing Valve. Henry D. Lauson, New Holstein, Wis., assignor to The John Lauson Manufacturing Company, New Holstein, Wis. Filed April 25, 1908. Serial No. 429,181.

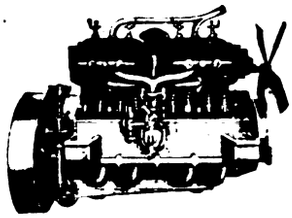
1. A mixing valve comprising a housing having a division wall, a port in the division wall, an oil duct in connection with the port, a check valve closure for said port and oil duct, a by pass aperture in the division wall, an air inlet in the housing below the division wall and an air outlet in said housing above said division wall.

903,212. Fluid Gage. Morris Martin, Malden, Mass. Filed Jan. 30, 1907. Serial No. 354,857.

1. The combination with a vertical wall of a tank and a bushing therein, of a gauge head mounted in said bushing and chambered at its opposite ends, a pivot mounted in one of said chambers, a magnetic needle mounted on said pivot, a bearing sustained in the other chamber, a rock shaft mounted in said bearing, a magnet applied to the inner end of said shaft to be moved between said bearing and the dividing wall of said head, and a float fixed to the opposite end of said rock shaft, the rock shaft and its magnet being turned as the float is raised by the fluid in said tank.

903,256. Vehicle Wheel. Martin L. Williams, South Bend, Ind. Filed Feb. 12, 1906. Serial No. 300,556.

1. In combination with a vehicle axle having a terminal yoke, a vehicle hub having an end closure plate and couple yoke movably connected with the axle yoke, coiled springs interposed between the interfitting parts of the axle yoke and couple yoke, an axle secured to said end closure plate and extending between said coiled springs and having driving connections independently of the latter.



903,349. Steering Gear for Motor Vehicles. Charles O. Barnes, Oswego, N. Y. Filed Jan. 11, 1908. Serial No. 410,379.

1. In a steering gear for vehicles, the combination with a housing and a mast having bearings therein, of two worms spaced apart on said mast one of said worms being adjustable, a single sleeve having internally threaded portions spaced apart and meshing respectively with the worms, a shaft adapted to be connected with the steering wheels of a vehicle, and means for transmitting motion from said sleeve to said shaft.

903,506. Acetylene Gas Generator. Edwin M. Rosenbluth, Philadelphia, Pa. Filed Aug. 29, 1907. Serial No. 390,584.

1. The combination with a gas generator; of a gas conduit leading from said generator and comprising a coil; a bracket maintaining said coil with its axis vertical and comprising a gas chamber in communication with said coil, and a bearing for said generator; a liquid trap interposed between said generator and said coil; and, a removable closure for said trap, substantially as set forth.

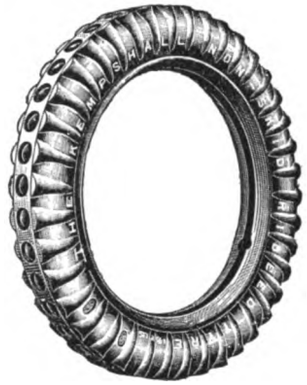
KEMPSHALL NON-SKID TIRES



BEST BY EVERY TEST, BECAUSE

1.—They last longest even on heaviest cars; the cheapest tire per non-skid mile on the market.
2.—They give perfect immunity from skidding even on the greasiest roads; patented moulded all rubber tread without steel or leather.
3.—They are low pressure tires, minimizing vibration and increasing comfort.
4.—They are freest from punctures and trouble; made from best rubber and fabric, and plenty of them.

SOLAR

SOLAR LAMPS

are acknowledged by every motorist "who knows," to be the **most dependable** lamps on the market. No emergency is too great for them—no road too dark. They insure safety when touring at night, because they are **powerful, efficient** and **properly built**, in the largest lamp factory in the world.

Badger Brass Mfg. Company

TWO FACTORIES:

437 Eleventh Ave., New York. Kenosha, Wisconsin

The Warner Anto-Meter

1909 Style

Guaranteed
Absolutely Accurate

is the only speed indicator made on the Magnetic Induction principle. Because of the principle it accurately indicates every range of speed from zero to the maximum.

All other instruments are made on the centrifugal principle. They fail to indicate any speed whatever under 5 to 10 miles per hour.

The Auto-Meter is so durably made that practical tests have shown that it will endure a **MILLION MILES** of riding without perceptible wear, or departing from absolute accuracy more than **10 feet to the mile.**

We invite comparative tests. Before you decide on any Speed Indicator, put the Auto-Meter on one side of your dash and any other indicator at any price on the other. Then use your watch over a measured course. Keep the instrument which **tells the truth.** We know which it will be.

"THE SILENT SELDEN"

$2,000 F. O. B. ROCHESTER, N. Y.

AFTER the remarkable results of our "first year"—the achieved success of 1908, we salute you with real and well established confidence as we introduce the Selden of 1909.

Not only has our promise to produce a high grade car of best materials and workmanship for $2000 been strictly fulfilled, but we have demonstrated the Selden genius in a silent, strong, comfortable, durable and handsome car. It does all that the owner wants to do and all that the chaffeur ought to do. Agents and owners are enthusiastic over it. Not a cheap car at all but one of the how-can-you-do-it-for-the-money kind.

Our 1909 wheel base is lengthened 5 inches from 109 to 114; the magneto and pump moved to left side of motor, the remaining equipment on the right; the brakes enlarged and now rigged inside the frame; the wheels now 34 inches were 32 inches; the radiator and hood made to conform in style to longer wheel base—little touches for style and convenience. No radical mechanical changes, simply because we couldn't find any necessary—no use fooling with what has proved so unusually good.

We can assure those who buy the 1909 Seldens all the efficiency of the 1908 Seldens with a little more style and a little more convenience, a little more refinement. The actual records of use and travel this year have so proven their merit, power and economic stability that it would be hard to promise anything better in practical construction.

THE COMING CAR OF MODERATE PRICE

Franklin Model D

When you want to make time, what is the limiting factor? Is it the horse-power of the motor, or is it the way the automobile rides?

There is only one answer, and it explains why it is that Franklin Model D with only 28 horse-power is able to make such high average speed. No other automobile except the six-cylinder Franklin equals it on American roads. You may have 60 horse-power and your maximum speed may be seventy miles an hour, but at the end of a day's touring you have not gone as far as your neighbor in his Model D. Your speed is held down to what the passengers can endure and to what you think your automobile will stand.

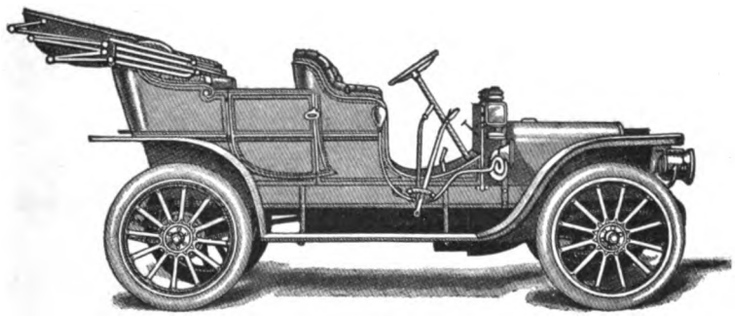
Speed then is a question of comfort—a question of the way the automobile rides.

And another thing—easy riding means that the automobile itself is not racked, strained and shaken to pieces. In the Worcester contest last December nearly all the contesting automobiles went through the run without road stops, but Franklin Model D was the only one to withstand the technical examination after the run. All the others suffered penalizations due to broken, strained or loosened parts. Having half-elliptic springs and the steel chassis frames, they suffered from the strain and shocks at speed over rough roads.

In another contest in which there was also an examination after the run, and in which Model D was perfect, twenty-five per cent of the other contestants broke their steel chassis frames.

Model D is always comfortable and you dare drive it. It will stand for speed when other automobiles will not.

An automobile that transmits shocks and vibrations to the chassis can not possibly give perfect riding comfort. Franklin Model D has four full-elliptic springs and a laminated wood chassis frame. Full-elliptic springs absorb shocks and vibrations. They give the maximum spring length. The springs on Model D are forty inches long. Half-elliptic springs to be any where near as good would have to be nearly seven feet long—an impracticable length.



But why discuss it? Everybody knows that full-elliptic springs are the standard for easy riding.

That easy riding means reliability and long life to the automobile itself, is not so well understood.

Then the wood chassis frame on the Franklin gives additional flexibility, helps to absorb and neutralize shocks and vibrations. The Franklin frame is also lighter and stronger than the steel frame commonly used. If you are interested, we will be glad to mail you a reprint of a technical article on this subject from the Horseless Age.

In addition to the two contests mentioned above, the 1909 Model D was perfect in three other contests, making five consecutive contests in which it won perfect scores. No other automobile went through more than two of these contests without penalization. Remember also that no automobile has been able to break the Franklin's San Francisco-New York record, not to mention the Chicago-New York record—the most severe reliability tests ever made.

Look into this question. Weigh and ride in Model D. Then weigh and ride in other automobiles over the same road at the same speed. You will understand the meaning of non-jarring, easy-riding construction.

FRANKLIN MODEL D, four-cylinder, 28 horse-power, five-passenger touring-car 2200 pounds, $2800. Single or double rumble seat runabout, $2700. Standard finish touring-car, royal blue; runabout, red and black. 36-inch wheels, same size as used on the best water-cooled automobiles weighing a thousand pounds more. Sheet aluminum body on steel angle frame—the strongest and lightest automobile body made. Three large and powerful brakes, acting on transmission and rear wheels. Selective type transmission, positive gear-driven oiler, Bosch high tension magneto.

Our forty-page catalogue de luxe treats the automobile question in a clear and fair manner, shows why the Franklin, now in its eighth year, is the automobile for those who want the highest standard of comfort and ability. Write for it.

Red Head

TRADE MARK

SPARK PLUG

MARCH 4th—INAUGURATION DAY

Could the RED HEAD Spark Plug be ushered into the automobile world on a more auspicious occasion?

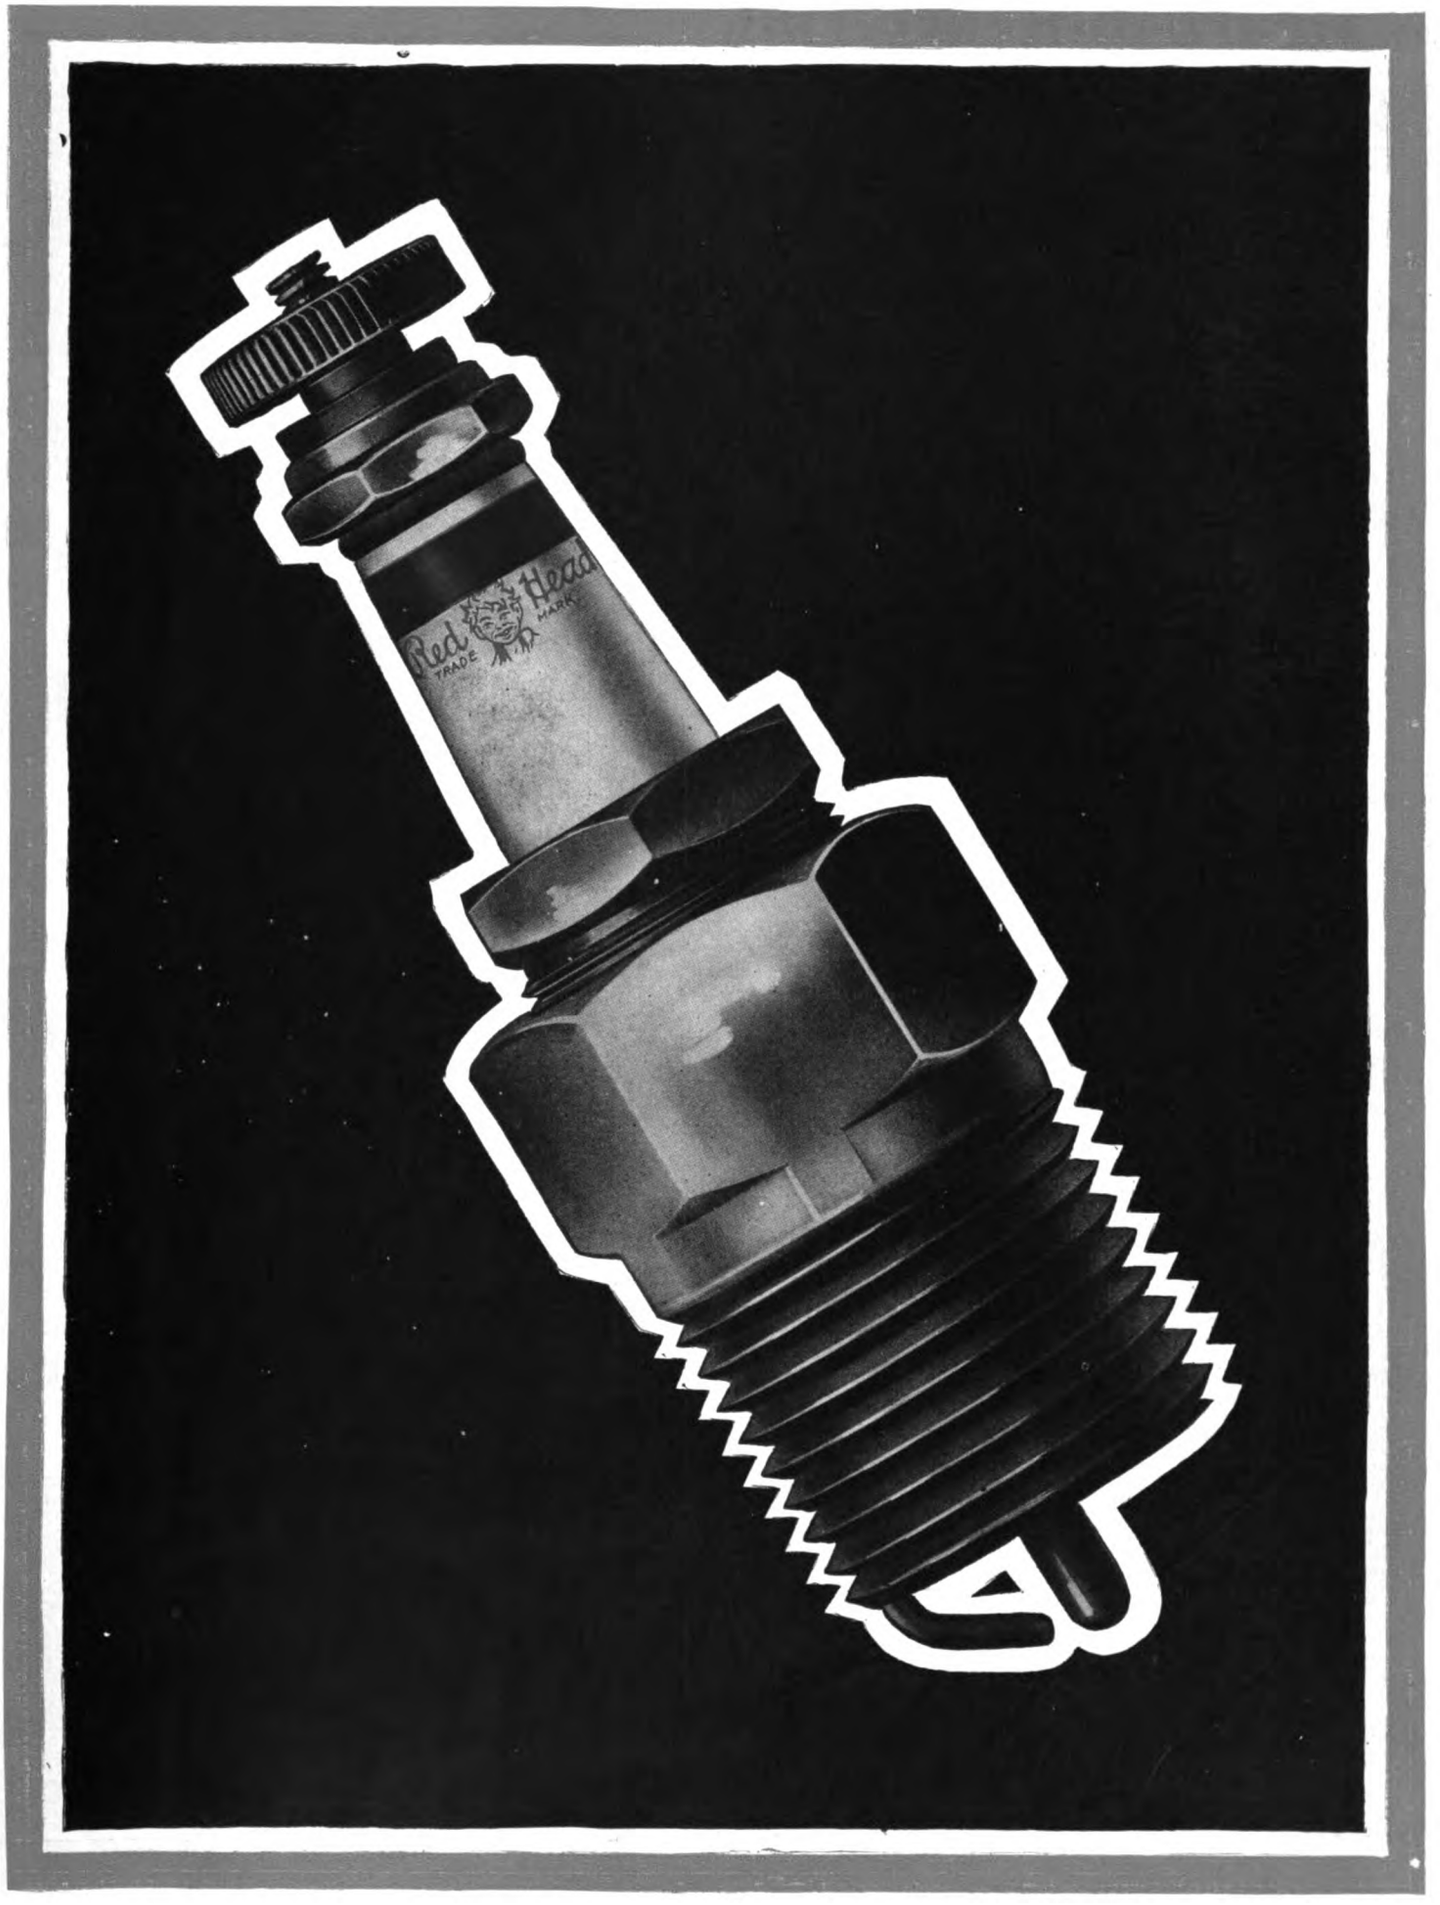
President Taft takes the oath of fidelity to the trust imposed in him, today.

The RED HEAD Spark Plug takes an oath to fulfill its mission in all kinds of gasolene engines and to be worthy of the motorist's trust—not for a four year term of office, but for all time to come.

Briefly: The RED HEAD is a Spark Plug furnished in either mica or porcelain and designed by men who have had years of experience in the automobile business, designing and selling spark plugs for other people.

The porcelain is a special mixture, scientifically compounded, and is guaranteed against cracking from heat.

The mica is specially selected and the cores are constructed under great pressure.



Both plugs are of the same construction and all parts interchangeable. One porcelain will fit all, and the mica core will fit the porcelain shell.

All sizes and all styles—One-half inch—A. L. A. M., or Metric—regular or long—porcelain or mica, $1.00

With each RED HEAD Plug comes some valuable information regarding the adjustment of plugs, coils, timers and wiring—that may save gasolene and add speed to your car.

A Heart-to-Heart Talk About the "Maxwell"

AN ADVERTISING MAN called on us recently and told us how we should—or rather how he thought we should—advertise the Maxwell. "You Maxwell-Briscoe people"—said he—"talk too much about your factories and equipment.

"WHAT DOES THE PUBLIC CARE," he continued, "whether you have three great plants—one at Tarrytown, N. Y., another at Pawtucket, R. I., and a third, the largest of its kind, at New Castle, Ind.? The public don't care whether your factories represent an equipment of a million and a half dollars or not. Tell them about the car itself—bring up all the talking points you have." We thanked him of course, for we like to have ideas, but—we did not follow his advice.

BUT THE PUBLIC DOES CARE—for today there are two hundred and fifty-three different companies making Automobiles. How many of these will be in business a year hence? Judge by past records: In 1902 eighteen concerns went to the wall; in 1903 thirty failed; in 1904 forty died. During the past five years one hundred and fifty-five concerns have discontinued—that's why we know the public cares.

WHEN YOU BUY LIFE INSURANCE—do you pin your faith to the newcomer in the field or to that concern which, by hard work and ample experience has been able to give its patrons an insurance that insures? In every line some name stands prominent—Steinway on a piano—Smith & Wesson on a revolver—McCormack or Deering on a harvester are known the world over. Why? Because they are standard. So it is in Automobiles—the "Maxwell" is the Standard Car of moderate price—of established value.

IT HAS BEEN OUR AMBITION to build the best moderate priced car; best in material, workmanship and durability. To this we have been faithful, by refusing to compete in price with every experiment.

MR. J. D. MAXWELL I consider the best designer of automobiles in the world; a man who from the beginning has been a hater of shams and a despiser of pretense—a man who has created an American car—not a copy.

NO OTHER CAR THAN THE MAXWELL incorporates in a single design the principles of **Three-Point Suspension—Multiple Disk Clutch—Thermo Syphon Cooling—Straight Line Shaft Drive—Metal Bodies**—principles that were as much a part of the "Maxwell" in 1904 as they are today.

THE MAXWELL LINE—MAGNETO EQUIPPED—is complete. The 30 H.P. 4-cylinder touring car or roadster, for those who want a speedy, powerful 4-cylinder car, costs $1,750. The 20 H.P. 2-cylinder touring car, fully equipped, the standard 2-cylinder car of America at $1,450—is the logical car at its price. The Maxwell 2-cylinder 14 H.P. runabout, the "Aristocrat of its class," costs $825, with complete equipment.

AND, LASTLY, THE MAXWELL JUNIOR AT $500. Here is a revelation—a 2-cylinder 10 H.P. Runabout—a Maxwell Runabout—for $500—one that we give our personal warrant for reliability and performance.

TWELVE THOUSAND SATISFIED OWNERS prove Maxwell success—and—remember, when you buy a Maxwell you buy a car behind which stands the Maxwell-Briscoe Motor Co., with an equipment which represents over a million and one-half dollars.

Benj. Briscoe
President.

1899 Model Equipped With Timken Bearings

EVENTS WON BY HAYNES CARS.

1895—(1) First prize, $150, for balanced motor, awarded by Chicago Times-Herald. (2) Speed Record, Louisville, Kentucky.

1897—(3) Speed Record, Charles River track, Boston, Mass.

1899—(4) First One Thousand Mile run made in America. This was accomplished by our phaeton, which ran from Kokomo, Indiana, to New York City.

1901—(5) Kokomo to New York City in 73 hours. (6) First Prize Blue Ribbon Certificate, Long Island Endurance run; one hundred miles during a heavy rain storm, without a single stop. (7a) First Prize Certificate in the New York-Rochester Endurance Contest. (8b) First Prize Certificate in the New York-Rochester Endurance Contest. (9) First Prize, Silver Cup, Five Mile Speed Contest, Fort Erie track, Buffalo, N. Y. (10) First Prize, Silver Cup. Ten Mile Speed Contest, Point Grosse track, Detroit, Mich. (11) Gold Medal, awarded Pan American Exposition.

1902—(12) Blue Ribbon, or highest award at the Long Island non-stop contest. (13) Blue Ribbon, or highest award at the Decoration Day run. (14) First Class Certificate in New York-Boston-New York Reliability contest, runabout model. (15) First Class Certificate in New York-Boston-New York Reliability Contest, standard model. (16) First Class Certificate in New York-Boston-New York Reliability Contest, surrey model.

All These Events Won on Timken Bearings

1903—(17) First Class Certificate in New York-Pittsburg run, touring car. (18) First Class Certificate in New York-Pittsburg run, runabout.

1904—(19) First Class Certificate in New York-St. Louis run. (20) Grand Prize at World's Fair at St. Louis.

1906—(23) In the final race, held third place on the American team.

1907—(24) Silver Cup, Automobile Dealers Association of Southern California, five-mile race for complete touring cars. (25) New York Motor Club, New York-Albany Endurance Contest, two hundred miles through mud and rain. Silver Cup for mechanical excellence and finishing first in its class. (26) Perfect score in four days Sealed Bonnet Contest, Automobile Club of America, 600 miles, with all working parts under seal; finished without a single adjustment. (27a) Perfect score in Chicago Motor Club Sealed Bonnet Contest, 176 miles, with all working parts under seal. (28b) Perfect score in Chicago Motor Club Sealed Bonnet Contest, 176 miles with all working parts under seal. (29c) Perfect score in Chicago Motor Club Sealed Bonnet Contest, 176 miles, with all working parts under seal. (30d) Perfect score in Chicago Motor Club Sealed Bonnet Contest, 176 miles, with all working parts under seal. (31) Perfect score in run from Los Angeles to Lakeside; most strenuous contest over mountain roads. (32) Perfect score in the Glidden Tour. The most difficult touring contest held in America. (33) Made fastest time of any car in its class, irrespective of price, in the Algonquin Hill Climb, Chicago Automobile Club Contest. (34) Perfect score in the New Jersey Automobile Motor Club's 24-hour endurance contest. (35) THE ONLY PERFECT SCORE IN THE CHICAGO MOTOR CLUB'S 600 mile reliability contest.

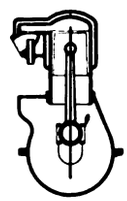
Rambler

The Car with the Offset Crank-Shaft

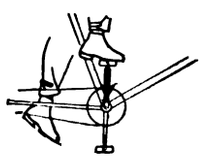
Model Forty-four, 34 H. P., $2,250.

Spare Wheel, with Inflated Tire, Brackets, and Tools, $74. Magneto, $150.



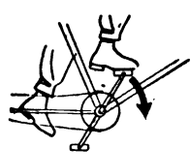
Why the Offset Crank-Shaft?

Notice a man about to mount a bicycle. He always adjusts the pedal in that position where it will receive to best advantage his full weight on the first downward stroke. This position for the pedal is just slightly forward of the center of the crank-shaft of the bicycle. If he mounted when the pedal was directly over the center of the crank-shaft, his weight would fall directly on the bearings and the first downward stroke would be retarded and therefore weak.

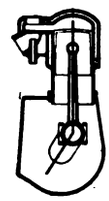


Now imagine the man's leg as the piston of an automobile engine, the pedal of the bicycle as the crank-pin, and the crank-shaft of the bicycle as the crank-shaft of the engine. In the ordinary engine the crank-pin and piston (the pedal and the man's leg) are directly over the dead center, and until the crank passes the turning point all effort is wasted. Thus when the explosion occurs the greatest force falls upon the bearings.

In the Rambler engine, at the instant the explosion occurs above the piston the crank-pin has moved past the dead center; the crank-shaft is in a position to receive the full pressure and turns without friction. No shock falls on the bearings; there is no side thrust, and wear on the cylinder walls is thus saved.



Because of this feature Rambler Model Forty-four can be operated smoothly and steadily at three miles an hour on high gear.



Ordinary engine. Position of piston at explosion center.

Corresponds to position of piston in ordinary engine at explosion center.

Corresponds to position of piston in Rambler engine at explosion center.

Rambler Offset Crank-Shaft. Position of piston at explosion center.

Seven-passenger model, 45 horsepower, with offset crank-shaft, $2,500. Other models, $1,150 to $2,500. A new Rambler catalog has just been issued. It describes and illustrates all distinctive features of new Ramblers—the offset crank-shaft, Spare Wheel, straight-line drive, etc. A copy on request.

THE MOTOR WORLD

Volume XIX. New York, U. S. A., Thursday, March 4, 1909. No. 23

PROBING ARNSTEIN'S FAILURE

Bankruptcy Action by Miss Hanley Displeases Many Trade Creditors—Estimate of Liabilities.

Trade surprise at the unexpected bankruptcy proceedings against Eugene Arnstein, the well known Chicago jobber, changed to puzzled interest and concern during the past week when some more or less unusual features transpired as to both the manner and the motive for the action. Instead of being the result of any impatience on the part of Arnstein's general creditors in the trade, the petition seems to have been filed at the instigation of Miss Nellie Hanley, who in the capacity of buyer and manager has been prominent in the affairs of the Arnstein business for a number of years, and who now claims to be a creditor of the concern to the amount of approximately $35,000 or $40,000.

It is claimed that Miss Hanley had an understanding by which she was to receive 12½ per cent. of the profits of the business as a reward for her services, and it is said that she has been content to let her portion accrue without any very definite accounting until latterly, when difficulties and less cordial relations between Arnstein and herself impelled her to vigorous measures. In justification of the bankruptcy action, it is suggested that this presented the simplest way by which she could get the accounting necessary for a determination of what is due her, as she has encountered baffling delays, heretofore, through the alleged reluctance of the proprietors to take inventory or strike a balance.

Many concerns in the trade, however, regard the action as ill-advised and as being likely not only to ruin the business, but to result in a serious sacrifice of the assets, if carried to the extreme. A number of the creditors have called a general creditors' meeting at the Great Northern hotel, Chicago, for Friday, 5th inst., to determine a course of action that will best protect the trade interests, the call being issued over the names of the following concerns: Corbin Screw Corporation of Chicago, Ill.; Hibbard, Spencer, Bartlett & Co., Chicago, Ill.; G & J Tire Co., Indianapolis, Ind.; Harris & Reed Mfg. Co., Chicago, Ill.; Frank Mossberg Co., Attleboro, Mass.; Hastings & Anderson, Chicago, Ill.; The Standard Co., Torrington, Conn.; and the Aurora Automatic Machinery Co., Aurora, Ill.

Unofficial estimates of the liabilities place the total at approximately $175,000, but the assets are as yet difficult to judge. Various members of the Arnstein family interested in the business are regarded as being very strong financially, and it is thought that a matter of indebtedness to the amount of $40,000 to one creditor or set of creditors would not have offered any serious difficulties to the firm under ordinary circumstances.

Pierce Engine May Make Only Cars.

Plans are on foot for the enlargement and conversion of the plant of the Pierce Engine Co., at Lakeside, Wis., into an immense automobile factory. The company has for the past three years been making a car in addition to its regular output of boats and gasolene engines, but the proposition at present being entertained provides for considerable additional capital, increased factory space and the production of cars alone. Those interested in the project with A. J. Pierce, the present owner of the business, include Frederick Robinson, vice-president of the Case T. M. Co.; C. R. McIntosh, treasurer of the Case T. M. Co.; and John Peebles, all of Racine.

Bosch to Build Magnetos in America

An American plant for Bosch magnetos and accessories is being arranged for, matters having progressed to a point where the Bosch Magneto Co., of New York City, is advertising in the German-American newspapers for factory help. Skilled workmen from other concerns in the same line are being engaged, and the indications point to early domestic production.

FORD TO SUE ON INFRINGEMENT

Claims that Other Makers Violate His Patent Rights on Shaft Drive—Notices Served on Five.

Demonstrating that in addition to being conspicuous as a defendant in patent litigation, as in the Selden controversy, it is also possible to assume an aggressive role, Henry Ford, president of the Ford Motor Co., Detroit, Mich., last week sent notices of alleged patent infringement to five prominent automobile manufacturers, declaring that they are violating his patent rights as to a particular form of the popular shaft drive construction. A further list of alleged infringers is being prepared, to whom similar notices will be sent, and as the notices are intimated to be simply the forerunners of suits in the United States courts, where the recipients do not fall in with the Ford view as to the alleged infringement, there is promise of a lively situation.

The patent which Ford declares is being infringed is No. 747,909, which, briefly, covers the following arrangement:

"An enclosed transmission casing to which is joined a hollow forward reach tube, enclosing the drive shaft. The drive shaft is connected with the engine shaft by means of a single universal joint. Coincident with this universal joint is the ball joint which connects the forward reach aforementioned with the frame."

The essence of the claim appears to lie in the arrangement of the single universal joint of the power shaft, inside the ball joint of the torque tube, where it connects with the frame. This prevents the shock and torsion of the rear wheels from being communicated to the frame, Ford says.

The makers so far selected for attention include two in Detroit, one in Cleveland, a fourth in New York State, and the fifth in New England. Examination of the products of other makers is being made with a view to their patent liability.

Digitized by Google

In the Retail World.

Blake Brothers, of Central City, Neb., have opened an automobile salesroom and garage. A well equipped repair department will also be maintained.

The Central Implement Co., of Omaha, Neb., has been appointed state agent for Schacht motor buggies. C. J. Anderson is president and manager of the company.

The Central Tire & Rubber Co., 2127 Farnam street, Omaha, Neb., which handles Firestone tires, has added a vulcanizing department. H. K. Wheelock is the manager.

F. J. Coddington, of Syracuse, Neb., agent for the Reo, is building a new garage and repair shop. It will be of fireproof construction throughout and will have cement floors.

Harry T. Clinton has opened western headquarters for the Fiat cars at 1424 Michigan avenue, Chicago, Ill. He will have charge of the territory from Pittsburg to the Pacific Coast.

W. J. Woods, of Spencer, Neb., who handles the Jackson Iine, has arranged for the construction of a new garage and repair shop. Present plans provide for its completion about the first of May.

William H. Wallace, of Omaha, Neb., has accepted plans for a salesroom, garage and repair shop on Farnam street, in "automobile row." The salesroom will feature the Oakland for which he is the agent.

The Drummond Carriage Co., of Omaha, Neb., has recently completed a new building for its automobile department, at 2024 Farnam street. A. R. Smith is manager, handling the White steamer and the Woods electric.

Seeley, Van Zant & Crackel Co. has opened at 930 South Main street, Los Angeles, Cal., for the sale of automobile supplies. All three members of the firm, which was recently incorporated, are well known in the local trade.

The Stewart Lumber Co., of Dennison, Ia., has embarked in the automobile business and has secured the agency for the entire Jackson line. A garage and repair shop is being built, which will be in charge of T. F. McGrath.

Buys Reliance, but not Oakland.

Rumors as to the activity of the more or less mysterious General Motors Co., of New York, in buying up prominent automobile properties, were again stirred late last week by the publication in a Detroit paper of a list of companies which it alleged the General Motors now controls, the list including not only the Olds Motor Works and Buick, together with the Reliance Motor Car Co., of Owosso, Mich., which has just been bought, but also again linking the Maxwell-Briscoe Motor Co., of Tarrytown, N. Y., with the enterprise, and this time the Oakland Motor Car Co., of Pontiac, Mich. Inquiries by the Motor World promptly brought denials from both the Oakland and the Maxwel-Briscoe companies as to any purchase by or affiliations with the General Motors Co.

Frederick O. Paige, who until the sale was president and general manager of the Reliance company, is engaged in the formation of a new company to manufacture an improved type of motor truck. H. A. Wilcox and Andrew Bachle, also formerly of the Reliance company, are associated with him in the enterprise, for which a factory in Detroit is planned.

John Prepares for Big Things.

George C. John has purchased the capital stock of the St. Louis Car Automobile Co., of New York, of which he has for some time been the manager. The purchase includes the stock, furniture and good will. By a deal closed this week, he has acquired the New York City and Long Island sales agency for the Marmon line, which in connection with the large eastern territory which he has obtained for the sale of Inter-State cars, and the American Mors product of the St. Louis Car Co., will place his company conspicuously to the forefront in the Metropolitan field.

Howlett in a Boston Berth.

Harry S. Howlett, formerly representing Diamond tires, and later with Fisk, has been appointed manager of the Boston branch of the Jones Speedometer. He will promote the Jones interests throughout the New England territory. The branch at Hartford, Conn., was burned out by fire on the 25th ult., and pending repairs, the Connecticut trade will be handled from the Jones Speedometer headquarters in New York City.

Green no Longer a White Manager.

Max R. Greene has resigned as manager of the Philadelphia branch of the White Co. to become associated with the Carl H. Page Co. in New York City. He is succeeded in Philadelphia by Evans C. Church, heretofore the assistant manager of the branch.

Hills Joins the Packard Forces.

Dr. H. H. Hills, assistant sales manager of the Buick Motor Co., Flint, Mich., has resigned to go with the sales department of the Packard Motor Car Co., at Detroit, Mich. He assumes his new duties this week.

Dowse at Detroit for G & J.

Ralph P. Dowse, of Chicago, Ill., has been appointed manager of the Detroit branch of the G & J Tire Co., to succeed Charles A. Monson. He has been a traveling salesman for the company for several years.

Browning to Manage a Branch.

Fred J. Browning has been made manager of the Philadelphia branch of the Autocar Co., of Ardmore, Pa. He was previously located at the factory, in connection with the production management.

The Week's Incorporations.

Mt. Jackson, Va.—Standard Garage Co., The, under Virginia laws, with $5,000 capital. Corporators—E. M. Hickman and J. L. Wissler, Jr.

St. Louis, Mo.—Auto Livery Co., The under Missouri laws, with $25,000 capital. Corporators—J. H. Overall, W. L. Clark and H. S. Turner, of St. Louis.

Brooklyn, N. Y.—Ambulance Auto Co., The, under New York laws, with $2,000 capital. Corporators—W. H. Douglas, G. C. Holmes and Faith Holmes.

Glen Cove, N. Y.—Red Spring Garage Co., The under New York laws, with $5,000 capital. Corporators—E. R. Weeks, H. L. Underhill and G. E. Hawkins.

Schenectady, N. Y.—Motor Wagon Co., The, under New York laws, with $25,000 capital. Corporators—Charles H. Bardwell, R. D. Lydon and L. B. Lockwood.

Wilmington, Del.—International Motor Truck Co., under Delaware laws, with $500,000 capital. Corporators—F. M. Shive, S. E. Roberson, and W. Davis, of Wilmington.

Chicago, Ill.—City Motor Car Co., under Illinois laws, with $50,000 capital; to deal in automobiles and accessories. Corporators—H. S. McCauley, T. M. Headen and H. F. Webb.

Detroit, Mich.—Hudson Motor Car Co., under Michigan laws, with $100,000 capital; to manufacture the Hudson car. Corporators—J. L. Hudson, R. B. Jackson and George W. Dunham.

Chicago, Ill.—Universal Rim Co., under Illinois laws, with $100,000 capital; to manufacture automobile wheels and rims. Corporators—C. G. Hawley, E. K. Baker and R. E. Aiken, of Chicago.

Dayton, O.—Gem City Automobile Co., The, under Ohio laws, with $10,000 capital. Corporators—William M. Carroll, Alexander W. McFarland, W. S. McConnaughey, Stella D. Fischer and John C. Shea.

New York City, N. Y.—Favary Tire & Cushion Co., The, under New York laws, with $1,000,000 capital. Corporators—Ethelbert Favary, Joseph Nordenschild and Charles S. Block, all of New York City.

Providence, R. I.—National Mfg. & Metal Co., The, under Rhode Island laws, with $25,000 capital; to manufacture, deal in and repair automobiles. Corporators—John B. Hartnett, David Rosenberg and John Mueller.

New York City, N. Y.—Geiszler Bros. Storage Battery Co., under New York laws, with $100,000 capital; to manufacture storage batteries. Corporators—H. M. Browne, E. J. Morhan and D. M. Barrett, of New York City.

Salt Lake City, Utah,—F. Arnould & Co., under Utah laws, with $5,000 capital; to conduct a general automobile business. Corporators—C. Bonnard, president and treasurer; F. Arnould, secretary and manager; A. Gigounon, director.

SECURES WIRE SPOKE PATENT

Torrington Concern Buys After Court of Appeals Sustains Claims—Controls Making of Spoke Nipples.

Comparatively limited as is the present use of wire wheels in automobile manufacture, the matter of the spoke nipples has been the subject of expensive and hard fought litigation, which has just been brought to a settlement. The parties to the proceeding were the W. J. Manville Machine Co., of Waterbury, and the Excelsior Needle Co., of Torrington, two of the wealthiest and most important concerns in the State of Connecticut. The first named was the plaintiff in the action which alleged infringement of the Campbell patent which it owned and which applies to the machine used for the manufacture of nipples and covers every process of production from headed blanks to finished nipples. The case was hard fought, but the United States Circuit Court of Appeals finally sustained the patent in its entirety.

Apparently realizing that the Campbell patent controlled the only means for economically and satisfactorily producing headed nipples of all sorts, whether for automobiles, bicycles, or carriages, the Standard Co., of Torrington, which several years since succeeded to the spoke business of the Excelsior Needle Co., with which it is related; at once stepped in and purchased from the Manville company the patent and all other rights, patterns, etc., pertaining to the manufacture of the nipples, thereby placing itself in an unassailable position.

Apperson Offers Toledo Bonds.

Pursuing his plan to take over the Pope Motor Car Co.'s plant at Toledo, O., on March 15, the purchaser, R. D. Apperson, has asked that city to subscribe $200,000 of the bonds which are to be floated in connection with the enterprise. The bonds are offered to Toledo investors at 90, making it necessary for them to raise $180,000 for their purchase. The Chamber of Commerce held a meeting to consider the proposition and has evolved a plan by which the subscription asked for may be obtained.

Shawmut Locates in Stoneham.

The Shawmut Motor Co., which was burned out at Stoneham, Mass., some months ago, has located in South Boston. The latter place was selected after overtures had been entertained from Reading, Fitchburg, Quincy and other nearby localities.

Marathon Making Ready to Build.

Cincinnati's new motor car concern, which was incorporated as the Marathon Automobile Co., is preparing a plant on Spring Grove avenue and will shortly commence the production of the "Marathon Six," which is to sell at about $2,000. The following officers have been chosen: Powel Crosley, Jr., president; Clifford Garvey, vice-president; John Rahn, Jr., second vice-president; Ralph Holterhoff, secretary; Frank H. Simpson, treasurer.

Lear Receiver to Continue Work.

Receiver Charles L. Bauer, of the Oscar Lear Automobile Co., of Springfield, O., has been authorized to borrow $25,000 to keep the plant in operation. The payment of two weeks' back wages to the employes, amounting to $3,000, has also been permitted under the order. The plant has shut down temporarily to take inventory, after which it will resume and complete the cars now in process of construction.

Will Make Automobile Tires.

Automobile tires will constitute a new line of production for the Rubber Step Manufacturing Co., of Exeter, N. H. Enlargements are being made to the plant with a view to accommodating the manufacture of the tires. The latter are to be made with a recently discovered cement mixture to fasten the rubber and the canvas, for which many virtues are claimed.

Toledo to Produce Electrics.

The Ohio Electric Carriage Co. has been formed at Toledo, O., with a capital of $200,000, and according to present plans is shortly to erect a large plant in that city. Its chief product will be electric coupes. H. P. Dodge is slated for the position of general manager, and many prominent Toledo business men are numbered among the stockholders.

La Grange Has Factory Prospects.

La Grange, Ga., is named as the probable home of a new automobile plant, to be backed by local and Atlanta capital. The company proposes to manufacture a "double steering gear type" of car, invented by an Atlanta man. Dr. F. M. Ridley, Jr., of La Grange, will be president, and W. W. Wisdom, secretary and treasurer.

Cleveland Autocab Changes Name.

The Cleveland Autocab Co., which has its factory at Geneva, O., has changed its name to the Ewing Automobile Co., to conform with the name of its product, the Ewing cab. No changes of policy or organization are involved and all negotiations entered into under the old name will be carried out under the new title.

Making Motors for International.

The International Harvester Co., popularly referred to as the agricultural machinery "trust," has ordered 500 four cylinder automobile motors from the General Mfg. Co., of Elkhart, Ind. The latter company has engaged J. H. Wells, of Pontiac, Mich., as its superintendent, because of his automobile experience.

HUDSON LAUNCHED IN DETROIT

Takes Plant Used by Northern and Commences Operations—Prominent Factors in the Organization.

Detroit, Mich., already remarkable for its motor car production, is to be the home of another automobile manufactory, in which R. B. Jackson, former general manager of the E. R. Thomas Motor Co., and George W. Dunham, at one time chief engineer of the Olds Motor Works, are leading spirits. The concern will be known as the Hudson Motor Car Co., and J. L. Hudson, who with Jackson and Dunham, is its organizer, has been chosen president.

The plant formerly occupied by the Northern Motor Car Co., at Champlain street and Canton avenue has been taken, and is being refitted and equipped with a view to commencing actual manufacturing operations as soon as possible. The enterprise starts with a capitalization of $100,000, all of which has been paid in, so that the way is clear to an immediate beginning of production activity.

In accordance with the company name, the car that is to be marketed will be known as the Hudson. As stated in the Motor World two months ago, Jackson has for some time been negotiating with a number of the prominent parts makers for power units and other components suitable for a high grade car, so that the output will probably be in the nature of an assembled product, but with the specialized elements selected with engineering wisdom that will result in an harmonious and well balanced whole. The technical knowledge and business experience represented in the new company serves to assure it of a prominent place in the field.

French Favor Compulsory Working.

Following England's lead in the matter of the compulsory working of patents, a change has been proposed in the French patent law, imposing more severe restrictions in this respect. The government has introduced a bill with the avowed object of insuring the adequate working of foreign patents in France. The principal provision of the bill, as translated by the correspondent of the London Times, is as follows:

"Patent rights shall be held to lapse in the event of failure on the part of the holder either to exercise his right in France or in the French colonies for a period of three years after applying for his certificate or to resume exercise of after a similar interval; or, secondly, in the event of only partial exercise of the patent in French territory. In the second event the patent courts will be invested with discretionary power to call upon the holder of the patent to show cause why he should not exercise his rights in French territory 'in an adequate degree.'"

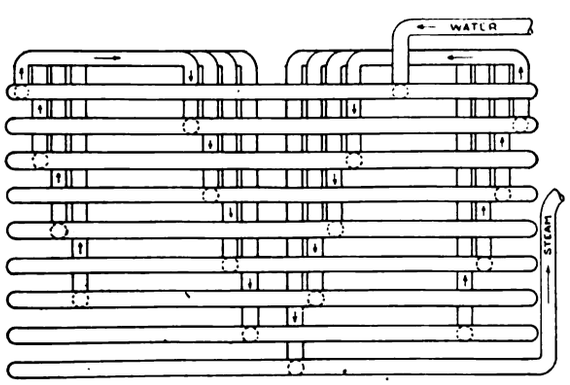
THE SIMPLICITY OF THE
WHITE STEAM GENERATOR

THE WHITE generator may be described as the fundamental distinguishing feature of the White Steam Car. No other steam automobile, or in fact, no other steam power plant is, or ever was, provided with such a device. As there are still some people who believe that the White generator in some way resembles the ordinary boiler, we should like to state most emphatically that there is no point of resemblance between the two, except that they both perform the function of converting water into steam. The essential points of difference between the two may be summarized as follows:

1. In the White generator, the water is at the top and the steam at the bottom. In the ordinary boiler, the water is at the bottom and the steam at the top.

2. In the White generator, the relative amount of water and of steam is not at all important. In the ordinary boiler, it is necessary that the water be kept at a certain definite level.



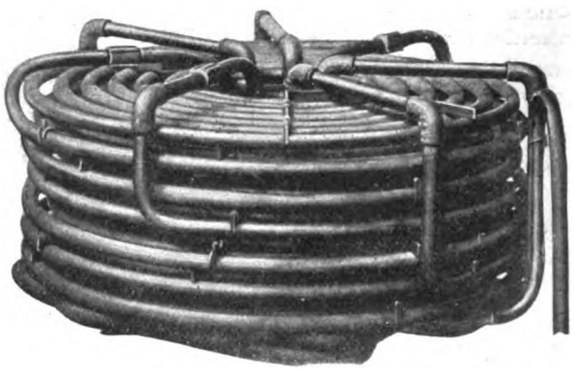


DIAGRAM SHOWING THE CIRCULATION THROUGH THE WHITE GENERATOR

THE WHITE GENERATOR

3. The White generator contains only a very little water and steam at any given time. The ordinary boiler contains great quantities of both.

4. With the White generator, a full pressure of steam may be obtained in a very few minutes. In the ordinary boiler considerable time is necessary to obtain full steam pressure.

5. The White generator has only twelve joints. The ordinary boiler has several hundred joints and the boilers in some of the early steam automobiles had several thousand joints.

6. The joints in the White generator are at the top, where they are not subjected to very much heat. In the ordinary boiler, about one half of the joints are exposed to the hottest part of the fire.

7. The joints in the White generator are much stronger than it is possible to make them in the ordinary boiler.

8. In the White generator, the water must enter the coldest part and be forced gradually to the hottest part. In the ordinary boiler, if the water level is allowed to run low, the entering water comes into contact at once with the hottest parts of the boiler.

Production Increase Unexpected.

Despite the prevalence of predictions that the year 1909 would witness a bumper output of the automobile product, it was scarcely to be expected that the early stages of the season would witness such a state of affairs as has been brought about by the early demand for cars. Not simply are manufacturers everywhere rushed to the limit of production in an effort to get their cars on the road and fulfil agency contracts, but the additional demands of the local dealers are proving so far in excess of the expectation in several instances as to prove a serious embarrassment to the makers and indirectly to the trade at large.

This pressure is nowhere felt more strongly than in the shops of the parts producers whose activities form the real barometer of industrial conditions. Already well stocked with orders at the beginning of the year, many of these producers have been brought to a state of real perplexity to know how to meet the requirements forced upon them as a result of an unexpected determination on the part of the manufacturers to increase their outputs. This decision, coupled with repeated urgings for haste in getting out parts for the allotments originally ordered, has created a condition which, in turn, has been passed on to the suppliers of raw material even.

At the same time, while the manufacturers who were reported long ago as "all sold up," are making deliveries rapidly, others who planned huge outputs are finding their expectations more than equalled in the demands for cars and more cars from their agents. Big shipments are being made to all the large cities and what is more, no indications are apparent tending to show that any stagnation exists in the distributing centers. In fact prosperity seems to have arrived with such a rush that there appears to be some question as to whether a temporary setback will be caused by the very unexpected nature of the increase in the market outlook.

Going to School in the Shop.

It is a part of the new order of industrialism that the old-school apprentice has been abolished. The modern manufacturer finds no time to devote to the drilling of a score or more of idle boys in the intricacies of any of the skilled trades, nor can he afford the expense which such training involves. Despite the nominal retention of the apprenticeship, it is pretty generally true that the system lacks both the thoroughness of the old system and the breadth which is demanded in the modern mechanic who may be required to turn his hand to most anything in the general line of his chosen calling. The age of specialization has left its mark everywhere and quite as much in the shop as in the counting room, on the workman quite as much as on the product of his labors.

In the establishment of trades schools, educators have striven manfully to overcome this tendency. But partial failure is inevitable except where the practical side is kept uppermost. In the shop, a boy may learn to be a skilled operative of any given kind of machinery. In the trades school he may learn a great deal about the technicalities of numerous processes, and yet he may not develop the skill of hand which comes only by constantly repeating those processes under all sorts of conditions. In systems of the practical sort where actual production as well as students' drill is sought, the ideal of thorough mechanical training is approached. But it is nowhere better developed than in factories where it is possible to combine actual experience in any given sort of work on a practical scale with sufficient drill to keep the pupil from brain stagnation and properly whet his appetite for more learning and more skill.

The idea of bringing the school to the shop is one of the newest and broadest of modern educational schemes. Its application in the case of the University of Wisconsin, where it has reached its highest state, for example, has made it possible for a whole State, men, women and children, to go to school and study along the lines of their daily work. Its expansion has provided courses of practical instruction given in many different shops during hours set apart from the working day and devoted to the improvement of the minds of those whose resources or inclinations precluded the possibility of more extensive primary schooling. This is a movement from the outside made on the initiative of professional educators. But employers have not been slow to appreciate its advantages or to see the benefit to their own cause which is attributable to it.

So in other localities the movement has come from the other end. Manufacturers themselves have come to see the necessity of developing their employes, particularly the young among them, and regular systems of instruction on a broad scale have been instituted which are intended to compensate in some measure for the elimination of the breadth of explicit instruction which obtained under the old order of things. An instance of this is found in the new system in vogue in Bridgeport, Conn., where apprentices from a large number of shops are permitted to attend school regularly during certain hours of the day which are set apart for the purpose, and there to carry on their education or make up for its deficiencies.

In perhaps no other line of industrial activity is the need of skilled and intelligent labor more urgently required than in the automobile industry. The motor vehicle movement even yet is in its infancy so far as the real importance of its application is concerned, and it is, moreover, an industry demanding the very best of the products of all subsidiary and contributory industries and arts. As the difficulties surrounding production increase, so the skill of the labor

Digitized by Google

which it involves must increase, and motor car building is recognized today as demanding the highest developments of labor and material alike. It is a happy circumstance, though a natural one, perhaps, that automobile manufacturers as a class should number among them not a few who are early in recognizing the advantages of hastening the education of their employes, and it is a foregone conclusion that those who do so will succeed in developing for their organizations an increment of zeal and loyalty as well as of manual dexterity well worth the cost.

Getting at a Rating System.

Motor rating for purposes of competition and as a method of classifying different models and sizes of machine are two very different propositions. At the same time, they have been confused in the public mind for so long a time, that it would appear to be a very difficult matter to segregate them. Yet the possibility of such a distinguishment already has dawned on the British horizon where the Royal Automobile Club has instituted within the past few days a new standard system of test and certification for motors in which is entertained not alone the maximum power of the motor, but also its proficiency under certain circumstances thought to be representative of its most arduous possible duties under conditions of regular service.

Should such a method be adopted at all generally, it would result in the establishment of a new sort of rating for all automobile engines, regardless of size or type, and quite apart from the traditional horsepower. In fact, it is probable that its introduction would result, for a time at least, in the coupling with the horsepower of certain additional and more or less confusing data in regard to the performance of the machine. For although the new test is in no way offered as a substitute for horsepower rating, it so elucidates and supplements the single exponent of nominal power output as to seem likely to have a very decided influence over rating practice and its interpretation.

General use of a method of certification of motors and machines such as is contemplated would tend to establish in the public mind a questioning attitude in regard to the value of horsepower alone, quite apart from what particular kind of horsepower happened to be under consideration. That such a condition of doubt already exists owing to the obvious inaccuracies of ratings commonly employed by manufacturers, goes without saying. At the same time, it is a difficulty from which there is no apparent outlet. In the case of the British motorist under the presumed condition of a prevalence of test certificates, on the other hand, the value of the bare term horsepower well might be sacrificed in the face of absolute knowledge of what any given car would do under circumstances such as might be met with in every day usage.

It has been predicted more than once that such a state of affairs would be arrived at ultimately, and indeed, it is difficult to see just what objection can be raised to it. In connection with the power, the weight of the vehicle, the ratio of reduction between engine and driving wheels, the power loss involved, and a number of other considerations are of vital importance in determining the net potentiality of the vehicle for road use. Yet these matters seldom are discussed outside the draughting room. It is true that the term power at the rear wheels, long has been argued as the ideal substitute for simple horsepower. But again, this may vary with the speed, the condition of carburation and ignition and a number of other considerations, while even the maximum is obtainable only under very restricted and favorable conditions. It is, in fact, hardly less a nominal value than the power of the motor alone.

As time goes on, confusion multiplies in the matter of engine and car rating at a rate which is bewildering even to the constant student of such matters. More and more the conviction grows that the users' interest in the name horsepower will gradually dwindle as he becomes more familiar with its use and comes to place stronger faith in the ability of the designer to proportion it wisely to the needs of each particular machine, and that ultimately it will concern them no more than does the pitch of the gears in the transmission.

Boys coasting with sleds or "double-runners" on city streets or park roads, present a fruitful source of winter accidents because of the suddenness with which they come into the path of motor cars. While the shock of collision will, of course, have its most serious physical consequence on the occupants of the sleds, it is no less the concern of automobilists to avoid mishaps of this kind by special caution in crossing streets or roads where coasting is popular.

COMING EVENTS

March 1-6, Buffalo, N. Y.—Buffalo Automobile Club's 7th annual show, Convention Hall.

March 1-6, Providence, R. I.—Automobile show.

March 2-6, Rochester, N. Y.—Automobile and Motor Trades Association of Rochester show, Convention Hall.

March 3-6, Lincoln, Neb.—Second annual automobile show, Auditorium building.

March 6-13, Boston, Mass.—Boston Automobile Dealers Association (Inc.) seventh annual show, Mechanics Building.

March 8-13, Kansas City, Mo.—Kansas City Automobile Dealers Association's show, Convention Hall.

March 8-13, Portland, Ore.—Portland Automobile Club's show.

March 8-13, Memphis, Tenn.—Automobile show, Auditorium Building.

March 11, New York City—Midwinter endurance run, New York to Boston, for Campbell trophy.

March 11, 12, 13, Milwaukee, Wis.—Milwaukee Automobile Club's first annual show in the Hippodrome.

March 13-20, Minneapolis, Minn.—Minneapolis Automobile Show Association's show, National Guard Armory.

March 15-20, Rochester, N. Y.—Rochester Automobile Dealers Association's show, Convention Hall.

March 16, 17, 18, Chattanooga, Tenn.—Three days race meet and hill climb on Lookout Mountain.

March 17, 18, 19, Pittsburg, Pa.—Three days' endurance run.

March 22-27, Toledo, O.—Toledo Automobile Dealers Association's automobile show.

March 23-26, Daytona, Fla.—The Motor Contest Association's (Inc.) seventh annual international races, Daytona Beach.

March 24-27, Syracuse, N. Y.—Syracuse Automobile Dealers Association's first annual show, New York State armory.

March 27, Atlanta, Ga.—Third annual hill climb, on Stewart avenue hill.

March 27-April 3, Pittsburg, Pa.—Automobile Dealers Association's show, Duquesne Garden.

April 5-10, New York City—New York Automobile Trade Association's second annual automobile carnival.

April 10, New York City—New York Automobile Trade Association's second semi-annual hill climb on Fort George hill.

April 15-17, Louisville, Ky.—Louisville Automobile Association's show, Coliseum.

May 22, Hartford, Conn.—Automobile Club of Hartford's 200 miles endurance run.

Digitized by Google

Boston to Stage Her Show in Hall of Arches.

Nineteen hundred and nine will go down in automobile history as the producer of a huge crop of local shows; more of them than ever had been held before. But as in former years, none of the local exhibitions will transcend in extent nor in elaboration of display the effort of the Boston Automobile Dealers Association, which opens next Saturday, 6th inst. The Boston show, because of its central New England location and because of the relatively late date at which it is held, serves as a more direct introductory to the selling season than either of the other big shows with which it really is fitted to class in point of bulk, while it also draws a huge attendance, in which is a liberal infusion of the actual buying class, mingled with the usual basis of mere curiosity seekers.

Boston's show this year, which will be the seventh annual recurrence of the event, promises to be fully up to precedent, both in the interest and variety of its exhibits, and in point of its decorations, which always are held in high esteem by the denizens of the Hub. According to the official list of exhibitors, there will be on view no less than 84 different makes of car, comprising the full range of pleasure and commercial types in gasolene, steam and electric classifications. These will be displayed by 67 different exhibitors, nearly all of whom are agents or representatives of manufacturers' branches. Motorcycles will be segregated in a section by themselves and will be shown by nearly a score of makers and agents. Added to this basic display will be Boston's own line-up of accessories.

In accessories, it would be observed, Boston exceeds the bounds set by practically every other show, not necessarily in numbers of different articles on view, but in point of the strength of local producers. Artfully included among the names of the accessory people the show list always includes sundry purveyors of soft drinks, peanut brittle and the local telephone company—three indispensables of any exposition held in Mechanics Hall. Excepting these, as of only passing interest to the seriously minded show visitor, it is made to appear that the exhibitors of accessories and supplies to the automobile rather than to its owner, will number no less than 166. The total number of exhibitors in the entire show thus mounts up to an even 250.

The staging of the show always has been a source of deep concern to the management. And it should be urged that their solicitude has been well rewarded, particularly during the last two years. For 1907 there was the presentation of the old New England apple orchard, with its real trees and realistic greenery. Last year the visitor upon entering the portals of the exhibition hall was magically transported into an Italian garden. What is in store for next week is told by manager Chester I. Campbell himself as follows:

"Our treatment of Exhibition Hall at the coming show, involves its transformation into what might be called 'The Hall of Arches.' The apparently numberless columns here are to be ingeniously made the foundations of immense decorative arches, the bases enlarged and treated with green onyx, having beautifully modeled capitals in ivorized plaster, from which will swing the decorative arches spanning the various aisles of the hall All of the arches will be modeled in high relief, with corner beads of raised plaster arches, and the soffits or underside of each arch will be studded with incandescents almost concealed in encircling rosettes, the lights themselves being in delicate colors.

"This arrangement of interesting arches produces necessarily a series of square ceilings, which will be treated in sunbursts of consistent colorings with decorative electroliers pendant from the center. Some idea of the vastness of the adaptation of this scheme can be had from the knowledge that there are to be nearly 100 of these arches in Exhibition Hall, and with the carrying out of the plans of rendering the main stairway in green onyx, as shown on the plans, the treatment of the walls in old gold and green fabrics, dividing the surface into panels by the use of green mouldings, the floor coverings for exhibitors all in accordance with the general decorative color scheme of velvety green and gold ivory, the transformation will be absolutely complete.

"Grand Hall will be treated in every way as far as possible to correspond in color scheme to Exhibition Hall, and although no arches will be constructed here, still the same consistency of design will be noticeable. The stage, always a stumbling block to the decorative designer, having nothing to start with but the bare walls with hard lines of proscenium arch as a basis, will prove a feature of this portion of the show. The great pilasters on either side of the stage will be modeled in plaster in the form of a huge decorative panel, with green onyx and ivorized plaster base, above which in high relief will be a splendidly modeled figure of the 'Genius of Progress,' holding aloft her torches of revolving electric lights of varicolored hues, while immediately above are the figures 1909, studded with incandescents.

"The new proscenium arch curtain especially designed and painted for this occasion, sweeps down and meets this on either side. Fringes to the curtain, edges to panels and the entire portier under the center of curtain are formed a blaze of beauty. All approaches to the stage and railings are designed in onyx decoration. The balconies will also be treated in backgrounds of ivory, with festoons and borders of dark green foliage and incandescents with splashes of color in flower decorations to give warm tones to the whole."

Further originality will be displayed in the mounting of the signs. The complete list of exhibitors and their wares is as follows:

AUTOMOBILES.

Omaha Show Introduces Some New Productions

Purple and white were the dominant colors in the setting which lent to the third in Omaha's annual show series, which opened on the 22d ult., its effectiveness. Western enthusiasm and dash, however, supplied the necessary element to make this one of the most successful of the smaller shows of the year, if not the most enjoyable to the visitor. When the doors were opened on the first show in Omaha, exactly six exhibitors were disclosed hovering around a pitifully small array of vehicles. The present effort resulted in calling out no less than 25 exhibitors all told, of whom an even score staged cars. Of different makes of car, there were 31, and these, together with the accessories displayed by the balance of the exhibitors, constituted a representation much appreciated by the visiting contingent, and most creditable to the efforts of manager C. G. Powell.

GENERAL VIEW OF THE OMAHA SHOW.

The floor of the Auditorium was marked off with a row of white posts, capped with electric light globes, while in the very center a larger post was surrounded by a big sign bearing the name of the show. The ceiling was hidden by folds of purple and white bunting, while from the balconies on either side, hung baskets of flowers and greenery. Upon the stage at one end, where the accessories were displayed, the purple and white combination was further worked out in the formation of an effective, neutral background for the exhibits.

One feature of general interest, was the appearance of several cars which have not before been seen this year—two of them, in fact, never before at any show. These were the Hupmobile, which is of the light and low-priced order, albeit thoroughly equipped even to magneto ignition; and mounting such features as a four-cylinder motor of 16-20 horsepower, unit plant with selective gearset and shaft drive; and the Velie "Limited," which is a staunch and modish appearing machine, possessing a 40 horsepower, high speed engine of Herreshoff design. Others of the newcomers, but cars already known in the market, were the International, the high-wheeled product of the International Harvester Co.; the Stanley steamer, and the Mason—the latter unusual in that it still retains its 24-28 horsepower, opposed type of motor and a number of other original features, but which is this year improved in a number of ways. An interesting point in its construction, which may be mentioned in passing, is the formation of the intake passages integrally with the cylinders and crank case, whereby all external piping is avoided. The complete list of exhibitors is as follows:

Automobiles: Atlantic Automobile Co., Ford and Reo; Bergers Automobile Co., Buick; Coit Automobile Co., Rambler and Mitchell; Deere Plow Co., John, Velie and Columbus gasolene and electric; Deright & Co., J. J. Stoddard-Dayton and Matheson; Drummond Automobile Co., White steam and Woods electric; Electric Garage, Baker electric; Freeland Bros.-Ashley Co., Mason and Midland; Huffman Automobile Co., Auburn; Huffman, W. L., Regal and Hupmobile; International Harvester Co., International; Kimball, R. R., Stevens-Duryea, Cadillac, Stanley steam and Babcock electric; Kuhn, Buick, Holsman; Lininger Implement Co., Oakland; Louk, C. F., Maxwell; Northwell Co., T. G., Brush; Oldsmobile Co., Oldsmobile; Pioneer Implement Co., Jackson and Detroit electric; Smith, Guy L., Franklin; Van Brunt, H. H., Pope-Hartford and Overland.

Accessories: Baum Iron Co., Central Tire & Rubber Co., Omaha Bicycle Co., Omaha Rubber Co., Powell Supply Co.

Representative Array of Cars at Buffalo Show

It is Buffalo's seventh annual show, which opened in the Convention Hall on Monday, 1st inst., and is holding for the entire week. Not only that, but it promises to be a record breaker in point of volume and attendance as well. From the very first, indications pointed to a far greater demand for space than had been anticipated. Cutting down the allotment of large blocks of space to individual exhibitors failing to remedy this difficulty, it was found necessary for the first time in Buffalo show history to have recourse to some of the space outside the main hall. Two rooms near the main entrance have been brought into use—the one to the right known as the ladies' room, and the one to the left, generally used as a buffet room. More than this, the room on the Virginia street side, generally used as a checkroom, has been pressed into use.

Under the adept handling of Manager Dai H. Lewis, who is the active representative of the energetic Automobile Club of Buffalo, which is holding the show this year for the first time, that ideal of show decoration has been developed—an unobtrusive setting. The ceiling is overhung with a star-spangled sky effect, with a suggestion of blue above and a red dado along the lower walls. Of elaborate decorative structures in the form of railings or walls between the exhibits, there are none, nor is the floor obscured by any sort of ornamental interjection to spoil the view of the cars or detract from their appearance. In fact practically the only conspicuous feature of the setting is the presentment of Uncle Sam himself, who appears in the guise of a chauffeur "outrunning the wind." He is steering a car at the climax of a loop-the-loop, high in air above the other cars which have secured the throne of royalty on the stage.

Aside from the fact that it is recognized

Digitized by Google

as a good "automobile town," and hence is attractive alike to agents and manufacturers, Buffalo is located within such favorable proximity to the manufacturing centers of the industry as to draw a notably representative array of cars to its portals during show time. In fact, in average quality the display "measures up" well with that of national shows. With a total of something like 150 spaces available, all told, and no less than 83 exhibitors, practically none of the well known makes of car are lacking from the show. In fact, it represents a first-class selection from the grand total which the market offers at the present time. A partial list of the exhibitors follows:

Automobiles: Babcock Electric Carriage Co., Babcock electric; Brown Motor Car Co., Ralph E., Winton and R. & L. electric; Brunn & Co., Franklin; Buick Motor Co., Buick; Buffalo Auto Exchange, Pope-Hartford and Selden; Centaur Motor Co., Oakland, Oldsmobile and Rapid; Co-operative Motor Car Co., Stevens-Duryea and Knox; Cramer, J. A., Stoddard-Dayton and Mitchell; Hatch, Mason B., Stearns and Chalmers-Detroit; Maxwell-Briscoe Motor Co., Maxwell; Meyers Carriage Co., Pullman, Firestone and Crawford; Pierce-Arrow Motor Car Co., Pierce-Arrow; Poppenberg Motor Car Co., Rambler, Premier, Reo and Regal; Thomas Motor Co., E. R., Thomas.

Accessories: Brainard, Harry P., Centaur Motor Co., Diamond Rubber Co., Denniston, E. W., Goodrich Co., B. F., Jaynes Automobile Supply Co., Neal, Clark & Neal Co.

Vehicles for Land and Sea at Portland Show.

Automobiles, motor boats, accessories and generalities combined to swell the display staged in the Auditorium at Portland, Me., last week, where the fourth annual automobile and motor boat show held the boards from the 22d to 27th ult., inclusive. Without either of the four contributory features the bulk of the affair would have dwindled appreciably, which is the same thing as saying that interest was about equally divided between the various classes of display. Marshalled under the management of Frederick M. Prescott, who has had the handling of each of the previous shows, the arrangements passed off smoothly, and the result is counted a big success, despite the fact that the total number of exhibitors was not as large as it has been on former occasions of the sort.

Decorations in the hall were confined to a liberal application of bunting—red, white and blue, of course—in streamers running athwart the Auditorium, and hung upon the walls. If the setting was less elaborate than has been the case at some of the other purely local shows, however, the affair lacked none of the interest which all well-conducted shows should have. A large number of the better known makes of car were represented in their latest guise, their improved condition as contrasted with their predecessors of 1908, serving to excite the expected amount of comment and admiration. Furthermore, the slight reduction in the total number of firms holding space on the floor could hardly be counted a disadvantage in view of the fact that those who were in evidence in a number of instances occupied larger spaces than ever before, so that instead of vacant spaces, there were larger displays of the favorite marks in more than one case, and consequently a better opportunity to study the product.

Of accessories, there was a liberal assortment, what lack of manufacturers existed being compensated for by the several jobbers and general supply men present, the extent of whose lines served to increase the variety of the array mightily. Excepting the marine section of the show, the wireless telephone people, and the merchants in candy and notions, the list of exhibitors was as follows:

Automobiles: Buick Motor Co., Buick; Commercial Exchange, second-hard cars; Darling Automobile Co., Reo; Gilson Auto Co., L. C., Mitchell and Stanley steam; Harmon Automobile Co., White, Franklin, Thomas and Chalmers-Detroit; Maine Motor Carriage Co., Stevens-Duryea and Peerless; Miller, J. Calvin, Black; New England Motor Sales Co., Marion; Nickerson & Co., F. A., Pierce-Arrow and Oldsmobile; Portland Co., The, Knox; Stoughton & Folkins, Maxwell; Stuart, George L., Cadillac; Studebaker Automobile Co., Studebaker; Wentworth, F. F., Overland.

Accessories: Bailey Co., James; Borne Scrymser & Co., Blake & Co., W. L.; Chamberlain, H. W.; Cobb., E. L.; Gordon Auto Supply Co., Harris Oil Co., A. W.; Little Oil Co., F. H.; New England Motor Sales Co., Salmon & Co., E. L.; Sterling Hardware Co., Underhay Oil Co., Vacuum Oil Co., Valvoline Oil Co.

Run of Minor Shows and a Show Run.

Inaugurated by a parade in which a brave showing of locally owned cars was made, Terre Haute, Ind., witnessed its first automobile show this week. The exhibition itself was opened on Tuesday, remaining open yesterday and closing to-night (Thursday) in the armory of company B, I. N. G. While not a huge show, as shows go, it was a huge success, and it followed in the footsteps of many another exhibition of its kind in that its manager, Charles Duffin was hard put to it to find space enough to accommodate all the exhibitors to their liking.

Preparations for the first show to be held under the auspices of the Milwaukee (Wis.) Automobile Club have advanced to the stage of allotting spaces, and 16 local agencies have secured stands for the affair. Dealers in accessories and supplies remain to be accommodated by the management. The dates set for the show, which is to be held in the Hippodrome, are Thursday, Friday and Saturday, March 11, 12 and 13, respectively.

Logansport, Ind., is to be numbered in the list of towns holding purely local shows this year, the agents and dealers of its vicinity having determined upon a show project of modest proportions and effected an organization with that in view. Thirteen makes of automobile are represented locally, not to mention a half-dozen different brands of motorcycle and a liberal array of accessories. These interests are represented in the new organization of which George P. Bliss, who is the leading spirit in the movement, has been elected permanent chairman. March 25, 26 and 27 have been fixed upon as the dates, and the Broadway garage, which formerly was a skating rink, as the place for the exhibit. Suitable decorations and entertainment will be provided.

Under the initiative of manager Chester I. Campbell, of the Boston show, plans are well under way for a mid-winter endurance contest to be held on Thursday, March 11, from New York to Boston. A sanction for the contest has been granted by the contest board of the American Automobile Association, and L. M. Bradley has been named as referee, while R. H. Johnson of the White Co., has volunteered his services as pathfinder and master of confetti. Arrangements for the affair are in the hands of Mills and Moore, who report a promising list of entries already. The winner is to receive the Campbell trophy, which was won by L. H. Perlman, the erstwhile "Motor King," in 1906, but which he has tendered back to its donor, at the same time suggesting that it be used hereafter as a perpetual challenge trophy.

AUTOMOBILE CAMP FOR SPORTSMEN

Complete Equipment Compactly Arranged for Transportation on the Car—Ample Shelter and Many Conveniences.

Its wood fire burning merrily and its kettles steaming, the "automobile camp" is one of the features of the Sportsman's show which this week is holding forth at Madison Square Garden, New York. To a large

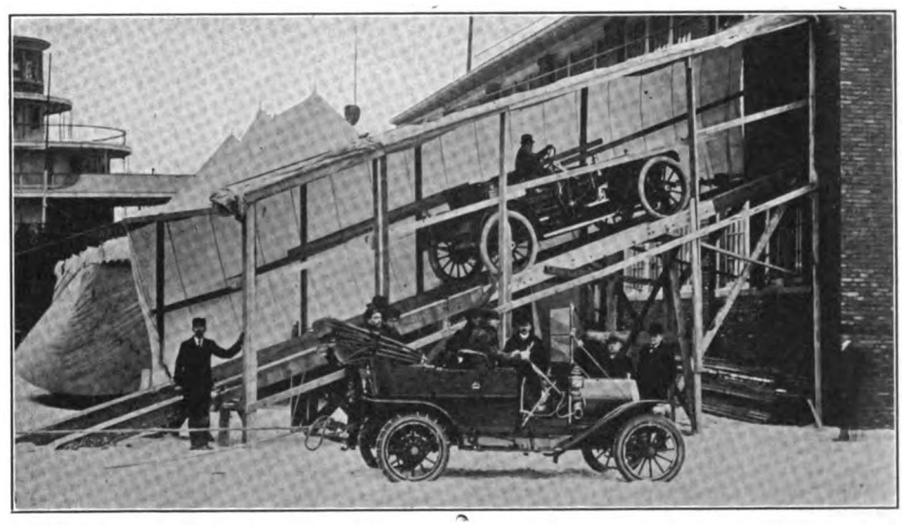
"AUTOMOBILE CAMP" READY FOR EXPEDITION

touring car is guyed an automobile tent, 8½ feet high. Scattered around the camp fire and near the tent are tables, chairs and cooking outfits enough to prepare an elaborate meal for seven people. In the tent itself, which is equipped with floors and door sills, is a pantry containing enough condensed food to last a party of five persons for two weeks. The sleeping accommodations consist chiefly of sleeping bags, which are claimed to be both cold and rain proof.

A duplicate of the outfit, including tent, flooring, furniture, sleeping bags, food supply and cooking utensils, all packed and ready for touring, is shown strapped to the fenders and running board of the car. It is claimed that with such an outfit, a party of five or even seven people could tour from New York to San Francisco or from Texas to Montreal and be independent of the hotels en route, and the originators of the ideas embodied in the exhibit paint glowing pictures of the automobile camp as placing at the command of the motorist almost any region where big game or unusually good fishing calls him.

The tent shown is made of a new material which is said to be both waterproof and wind proof, and is the same as has been selected for the Roosevelt expedition to Africa. Each of the elements of the outfit is a specialty developed by a separate manufacturer, but assembled by one concern into a complete equipment. On the car, the small space required is evident from the accompanying illustration of a touring car to which the complete camp equipment is strapped. The remarkable extent to which the tent and other articles comprised in the outfit may be condensed for carrying purposes permits of a generous spread of floor space and ample room when in camp, without seriously encumbering the car when on the road.

Midgleys for Pope Testers.



With an intimate knowledge of the conditions to be met, the Pope Mfg. Co., Hartford, Conn., has selected the Hartford Midgley Tread Tures, which also are natives of Hartford and are made by the Hartford Rubber Works Company, as the equipment for their test cars. The contsruction of the Midgley tread, which incorporate a series of four coils of steel wire vulcanized in the surface of the rubber, makes them particularly adapted to meet the rigorous requirements of test running. Frequent changes and unsparing use of the high gear and the brakes renders this one of the most severe trials to which the equipment can be put.

PLEASURE CAR IN UTILITY STUNT

Acts as Traction Engine in Housing Exhibits at Detroit Show—Moves Many Heavier Vehicles up an Incline.

Unkind and antagonistic commentators find pleasure in the spectacle usually presented in connection with automobile shows, of the display vehicles being transported or hauled into the show building by horses, but at the recent Detroit exhibition they were in a large measure cheated of the opportunity for such raillery. For a time it looked as though the horse would have to play its customary part, but the reluctance of the management to permit even subsidiary equine participation led to an offer being made to several power truck manufacturers to have their products do the pulling and hauling that was necessary in conveying the exhibits up the incline to the second floor of the building.

One maker finally accepted, but the truck failed to appear and the congestion of show cars waiting to be hauled up the incline grew to such an extent that an E-M-F. touring car was pressed into service to attempt the job. Its first efforts were a failure, in that the rear wheels spun around without sufficient traction. Inviting the idle men and boys standing by, to pile into the tonneau, the show manager succeeding in loading the car down so that the driving wheels gripped, and, as indicated in the accompanying illustration, the exhibits were drawn up the runway in smart style, by means of a 1½-inch rope and a single and double block. The incline presented a rise of 13 feet in 40, giving a grade of a little more than 30 per cent. Over 50 of the 62 cars which were drawn up weighed more than twice as much as the car which supplied the power, the latter being in service for about 36 hours in the work.

E-M-F. TOURING CAR IN EMERGENCY SERVICE

STANDARD TEST OF PERFORMANCE

Royal Automobile Club of Great Britain Adopts a System of Certification—Its Purpose and Method.

Failing as yet to arrive at a thoroughly satisfactory solution of the engine rating problem by any simpler means, the Royal Automobile Club of Great Britain has at length fixed upon a standard method of test which shall be employed in certifying to the performance of engines, whereby manufacturers may obtain for their product an absolutely authentic statement of the capabilities of their product. It will be remembered that the effort to develop a suitable and simple rating formula has resulted in a tremendous amount of theorizing during the past two or three years, the so-called R. A. C. formula, which is the same as that subsequently adopted by the Association of Licensed Automobile Manufacturers in the United States being one of the results. This expression failing to give a satisfactory account of the probable power of a motor of given dimensions, a special commission was appointed last year for purposes of investigation, consisting of representatives from the automobile club, the Institution of Automobile Engineers, and the Society of Motor Manufacturers and Traders. Despite the lapse of considerable time since its appointment, however, it has as yet brought forward no distinct recommendation of a simple substitute for the R. A. C. formula. While in no sense an expression of despair at the impossibility of arriving at an equable means of rating by algebraic means, the club's latest action is evidence enough in itself that such methods are considered impracticable or at least insufficient at the present time.

The purpose and method of the new standard test as set forth in a set of regulations issued by the club are as follows:

The object of the trial is to submit an engine to a test of comparatively short duration representing the equivalent of a considerably longer period in ordinary use.

1. The trial will be held under the Certified Trials Regulations except as regards Clauses 6, 8, 9, 10 and 12, which shall not apply.
2. These regulations shall apply equally for any engine, irrespective of the number of cylinders.
3. The certificate shall show, inter alia, the results of the following tests:
   a. The fuel consumption on the bench.
   b. The output of the engine, as specified by the entrant, maintained for a period of two hours, or any multiple thereof (at the declared number of revolutions), obtained without interruption of the test for which the entrant may at the time of the test decide to coninue; together with the period during which the b.h.p. does not fall 7 per cent. below the b.h.p. as specified by the entrant.
   c. The maximum b.h.p. which can be maintained for 15 minutes below some limiting speed to be declared by the entrant.
   d. A record of all repairs and adjustments (except those connected with the carburetter or ignition gear) which may cause stoppage of the engine.
4. The average cooling water temperature at the outlet and inlet from the engine will be recorded. The temperature of the cooling water supplied during the entire test on the bench must not be less than 50 C. or 122 F., and will in any case be recorded.
5. Every engine so tested on the bench shall be run at least 50 miles in a car (on Brooklands or on a private track) and for any further distance asked for by the entrant at the time of entering. The speed of the car shall be such that when it is on top speed the engine will be running at two-thirds of the revolutions at which the maker has declared the horsepower. The maximum speed obtained over any distance of not less than 2 miles shall be recorded.
6. The weight of the engine, the weight and wind area of the car will be recorded.
7. The Club shall test the R. A. C. number of the fuel used.
8. No dismantling of any vital part of the engine shall be allowed between the bench test and the car test, i. e., no part of the crank case (including any inspection cover, cylinders, cylinder heads, or valves) shall be removed.

Obviously the intention is to embody in the certificate practically all that an exacting manufacturer would require on the data sheet pertaining to the test of one of his own motors, and made out by his own experimental department but standardized in such a way that the certification may be used in comparing machines of different makes for purposes of competition or otherwise. The particular utility of such a system, by contrast with any method of rating by set formula is that it is applicable equally as well to engines of unusual, not to say freakish pattern, as to those of strictly standard proportions.

Thus, it is pertinently indicated by interested parties in England, that the new R. A. C. test is likely to prove particularly enlightening as applied to the 1909 Daimler engine, which is the notorious adaptation of the American Knight engine, and which, judging by the claims of its makers, might be regarded as a favored competitor if, for example, it were to be put into a race on a horsepower rating based on the old formula which took into account only the bore of the cylinder, and disregarded all considerations of stroke, method of gas distribution and speed.

Objections already are forthcoming to even this Utopian scheme, however, and apart from the obvious difficulty of inducing manufacturers to make use of the system freely and wisely, it would appear that the education of the public to the full value and significance of the tests, which is the point brought up, would be difficult of accomplishment. Says one commentator in this connection:

"The one and only drawback that we anticipate has nothing to do with the tests, nor with their inherent utility to the owner and the user. The fear is that the purchasing public will altogether under-estimate the severity of the trials, owing to their very compactness and comparatively short duration, or that they will erroneously fail to detect the deep significance of bench-tests to themselves as automobilists rather than as 'engine drivers.' Should that unfortunate line be adopted at all generally, the makers will not find it worth their while to obtain the R. A. C. certificates. And the motoring public would then be the losers as a result of the delusion that the road shocks of ordinary touring can impose strains upon an engine that are at all comparable with those in the test-room or those of continuous high-speed traveling at Brooklands."

Supplementing the Inclined Footboard.

Development of the push-pedal type of clutch and foot brake control has resulted in the rapid introduction of the inclined footboard, which is useful among other things, as a means of concealment for some of the accessories which formerly were mounted directly on the dash. At the same time, the practice has resulted in many machines in a driving position which is far from comfortable, particularly on a long run. In some instances the pedal plates are placed so far above the floor that it is only with difficulty that the feet can be kept in place after a few hours of continuous driving. To obviate this difficulty without robbing the machine of the neatness which arises from the use of the inclined footboards, one foreign designer has arranged the flooring in front of the driver's seat with special regard to convenience in control, while that on the left side is given the popular rake.

Another Amphibious Automobile.

Land and water combinations still appeal to inventors, and Rear Admiral J. A. Howell, U. S. N., retired, who makes his home in Atlantic City, N. J., has been amusing himself in devising a vehicle which will not only travel the roads, but will plow the waves. He calls it "The Amphibian," and its appearance on the street suggests a runaway submarine. Every bar in Atlantic City felt a distinct slackening in trade as the result of the machine's visual impression on the citizens and visitors, when it came out the first time recently. The admiral and his son, a young engineer, have spent about $7,000 on it so far, and hope to perfect it soon to practical capabilities.

Replacing Hose in Water System.

When rubber hose is used in the water system and its removal is necessary to effect a repair, some difficulty may be experienced in replacing it, owing to the end of the pipes being corrugated. If vaseline be smeared on the inner surface of the hose, at the ends, and also around the outer surface of the water pipe, the hose replacement will be greatly facilitated with minimum effort. When replacing the hose clamps care should be taken to place them back of the expanded portion of the pipe, so that when they are tightened, no water will find its way past the joint to the outside.

FAST FLIGHTS IN ZIG-ZAG CLIMB

Apperson Makes Spectacular Run at Pasadena-Altadena Meet—A Day of Close Contests and Broken Records.

With 20,000 persons in attendance, a course faster than last year, and a more representative and faster field of contestants, the fourth annual Pasadena-Altadena hill climb, under the auspices of the Automobile Dealers' Association of Southern California, on Washington's Birthday, 22d ult., proved the most successful event ever promoted in Southern California, and one of the most successful hill climbs ever held in America. Not only was the record for the course broken by Edgar Apperson, when he dashed up the long winding hill in the remarkable time of 1 minute 24 seconds, but nearly all the records in the various classes were shattered. Honors between cars also were well divided. Upon the point system of scoring—5 points for first, 3 points for second, 2 points for third, and 1 point for fourth—the Kisselkar took premier honors with 19 points, and the Apperson, Stoddard-Dayton and Chalmers-Detroit were next in order, with 15, 13 and 11 points, respectively.

Considering the poor police surveillance of the course, it was miraculous that not a single catastrophe marred the meet, although one narrowly averted accident gave one section of the crowd a thrill for the moment it lasted. An unknown man elbowed his way through the lines and stepped in the middle of the road just as Apperson, in the big racer bearing his name, came careening around the curve. The man ran for his life, and Apperson swung wide, barely missing the ditch at the side of the course. The unknown man soon disappeared.

The course was in splendid condition for the contest, and a bridge over the Pacific Electric Railway tracks permitted the drivers to jump over this at full speed. The course measures exactly 1.35 miles, with a gradient rising from 3 to 14 per cent., and which contains three turns.

By far the most spectacular performance of the meet was the record run of Edgar Apperson in the free-for-all. Apperson drove fearlessly, took all the turns at full speed, and flashed across the tape at the top of the long incline almost before the spectators had time to jot down the time made by Frank Seifert, who started the event, and finished in 1:36¼. Apperson's time for the course was 1:24, which was 12¼ seconds faster than was made last year by himself over the same course.

Barney Oldfield was picked to either beat Apperson or at least give him a close run for the honor. Oldfield lost the chance by a poor start. It took Oldfield just 19 seconds to negotiate the first leg of the course to the straightaway leading to the railroad crossing, while Apperson covered the same distance in 14 seconds. The Stearns appeared to be going faster at the finish and many in the grandstand there thought Oldfield had won until the time was announced —5½ seconds slower than the Apperson. Bert Dingley also made a good run in the Chalmers-Detroit, covering the course in 1:50, or one-half second faster than in a previous event.

In all the stock car events the rule requiring both roadsters and touring cars to carry their full complement of passengers, was enforced, and despite this handicap, faster time was made in a majority of events than was made in the corresponding classes last year.

The only protest occurred in the class for roadsters costing from $2,501 to $3,000, which was won by Bert Dingley, in the Chalmers-Detroit, in 1:56¼. The rule required that the drivers must be local men, and although Dingley is a native of California and has been working in Los Angeles for several months, some persons were inclined to think that he was not entitled to start. He was allowed to compete under protest, however, and won by a narrow margin from Harris Hanshue, who piloted the Kisselkar in the excellent time of 1:58½. Dingley also captured the free-for-all roadsters, the stop watches recording 1:50½. Hanshue again gave him a stiff battle and lost out by only five seconds. This was the best contested event of the day as honors were very close. Shettler in the Apperson romped up the incline in 1:58¼, only two seconds faster than Seifert in the Stoddard-Dayton, who in turn defeated Hamlin in the Franklin by only 1½ seconds. It really was a blanket finish as there was less than six seconds between the times of the first and fifth cars.

Another close fight was witnessed in the roadster class with price limitations of $3,001 and $4,750. Hamlin and his Franklin were timed in 1:59, but Shettler, in the Stoddard-Dayton beat him by five seconds. In another roadster class Shettler drove a Kisselkar to victory in 2:40.

William Ruess, who sometimes is known as "Wild Bill," demonstrated that he is a starter whose word is law. When the free-for-all started Dingley claimed that he was not given time to get to the line, so another start was allowed. This time Dingley was over anxious and tried to beat the gun. Ruess called him back, fined him $25 as an indication that he was not to be trifled with, and finally sent him away to a good start. Ralph Hamlin suffered a like penalty in the free-for-all, but Hamlin did not mind as his second start proved to be much better than the first.

The summaries:

Runabouts and Roadsters, $501 to $1,000, Two Passengers.

1	E. M. Roe, 20 Ford	3:02½
2	F. Murray, 20 Buick	3:45
3	Lee Garricke, Reo	3:46

Runabouts and Roadsters, $1,001 to $1,500, Two Passengers.

1	Gus Seifert, 25 Stoddard-Dayton	2:28¾
2	F. S. Howard, 20 Buick	2:57¾

Touring Cars, $1,000 to $1,500, Five Passengers.

1	Lee Garricke, 30 Kisselkar	2:57½
2	Joe Lodge, 24-30 Regal	3:03⅗
	T. M. Davis, 30 E-M-F	*
	George Kussman, 22-24 Tourist	*

Roadsters, $1,501 to $2,000, Two Passengers.

1	L. T. Shettler, 40 Kisselkar	2:40
2	Gus Seifert, 25 Stoddard-Dayton	3:12⅕

Touring Cars, $2,001 to $2,500, Five Passengers.

1	George Kussman, 45-50 Tourist	2:39½
2	W. C. Vaughn, 40 Apperson	3:02½

Touring Cars, $1,501 to $2,000, Five Passengers.

1	Frank Murray, 40 Buick	2:36¼
2	Lee Garricke, 40 Kisselkar	2:53¼
3	A. G. Woodill, 40 Oakland	2:59

Roadsters, $2,501 to $3,000, Two Passengers.

1	Bert Dingley, 40 Chalmers-Detroit	1:56¼
2	Harris Hanshue, 60 Kisselkar	1:58½
3	Harry Alles, 45 Stoddard-Dayton	2:06

Touring Cars, $3,001 to $4,750, Seven Passengers.

1	J. Salling, 60 Thomas	2:48¼
2	Carl Hagar, 50 Marmon	3:34⅕

Roadsters, $3,001 to $4,750, Two Passengers.

1	L. T. Shettler, 50 Apperson	1:55
2	R. C. Hamlin, 52 Franklin	1:59
3	Bruno Siebel, 50 Marmon	2:54⅘

Stock Roadsters, Free-for-all.

1	Bert Dingley, Chalmers-Detroit	1:50½

Bridgeport Plans a Memorial Day Climb.

Fifty new members were recently admitted to the Bridgeport (Conn.) Automobile Club as the result of a campaign instituted by President Staples. The contest committee has been authorized to begin preparations for the annual hill climbing contest to be held on Memorial Day. In former years the event has been pulled off on Sport Hill in Easton, but as there is talk of compelling the club to pay for the use of the hill this year, Snake hill in Mill Plain will probably be the scene of the contest.

GETTING IT INTO THE LIMELIGHT

Sanction for New York-Seattle Race Granted by A. C. A.—"International" Aspect of the Contest a Surprise.

Once upon a time a young man went forth to undertake a venture in publicity. The advice he received from an advertising oracle whom he consulted in advance was: "Take on every quarrel you can get—they interest the people and win you priceless amounts of space in the newspapers." This is precisely the idea suggested by the attitude of the promotors of the proposed transcontinental race from New York to the Alaska-Yukon-Pacific exposition at Seattle. By securing a sanction for the event from the Automobile Club of America instead of from the American Automobile Association, which has lately reclaimed some of its lost prestige in the government of automobile sport, it is in a very fair way to secure a most enviable amount of free advertising.

Avoiding plain sailing over the obvious course of applying for a sanction from the contest board of the A. A. A., the promotors of the contest, which is to say, Messrs. Mills and Moore, with remarkable promptitude, came out with the unexpected announcement that the contest is to be of the international order, and applied to the Automobile Club of America for a sanction under the terms of the now-forgotten "treaty of peace" of last fall. This, the willing club promptly granted, stipulating only "that all prize money and trophies should be absolutely guaranteed," and "that the rules should be submitted to the contest committee of the club for approval."

The start of the tour or race, originally had been nominated to occur somewhere between May 15th and June 1st, and the A. C. A. sanction reads June 1st in consequence. It will be remembered further, that the new rules of the contest board of the A. A. A. specifically state that no sanctions will be issued for a long distance road reliability contest within one month of the duration of the Glidden contest. While, of course, no one suspects for a moment that this fact had anything to do with the sudden determination to call the New York to Seattle affair an international contest, it may be considered a remarkable coincidence that a recommendation is now being considered to advance the date for the start of the race to somewhere between May 20 and 25, in order to avoid interference with the Glidden tour. This information was communicated to the Motor World by a representative of Mills and Moore.

It was further explained that the A. C. A. sanction had been obtained for two reasons: First, because the cause of the race already had been canvassed abroad so successfully that a number of entries were expected of cars not represented by American agents; and second, in order to gain access to the extensive information in possession of the bureau of tours of the A. C. A. An emenation from the same source sent out late last week, however, placed the matter in a slightly different light, thus:

"When asked why an international sanction had been granted this contest when one was not considered necessary for the Daytona, Fla., races, a prominent member of the contest committee of the club said, 'An examination of the entry blank of the Daytona races and the application for sanction disclosed that the races were not of such a character as to require an international sanction, whereas from investigation of the transcontinental contest for the Guggenheim cup, we are convinced that it will be international beyond a doubt.'"

The kernel in the shell is indeed a pearl of inconsistency. For whereas the original A. C. A. definition of an international contest so constituted any event advertised as such, and whereas the Daytona meet is advertised on the entry blank as an international contest and presumably is to be run under the full sanction of the new A. A. A. arrangement, the transcontinental event—which, by the way, is announced by the publicity department of the Alaska-Yukon-Pacific exposition as being "under the management of the Automobile Club of Seattle"—had not been characterized as anything other than national prior to the application for the lovely sanction which it now holds. Furthermore, so far as is known, no entry blanks for the latter event have as yet appeared.

Program for New York Carnival.

Plans for the carrying out of the carnival project of the New York Automobile Trade Association, which has been fixed upon for the week of April 5th, were announced following a mass meeting of the trade held at the Automobile Club of America late last week. The program as it at present stands will include a big daylight parade on Saturday afternoon, April 10th, in addition to which there will be a hill climbing contest on Fort George hill, gymkhana games and tests of cars at Morris Park, and straightaway time trials on Ocean Parkway, with a smoker at the club house of the Automobile Club of America on Saturday night, when the different trophies and prizes of the week are to be handed over to the winners.

An additional committee of ten was nominated at the meeting to assist Gen. John T. Cutting, chairman of the finance committee in raising the necessary funds for the enterprise, which it is estimated must be brought up to between $15,000 and $20,000. For this purpose, the following were named: E. W. Bonham, F. M. Hadley, Harvey Adams, W. J. Coghlan, F. M. White, George F. Hare, Oscar Hausen, Richard F. Fenker, W. C. Poertner, Harry Pyke, and A. J. Interriedon.

WANTS ITS OWN RULES TO GOVERN

Harrisburg Club Conditionally Willing to Get A. A. A. Sanction—Schedule for Its Reliability Contest.

Annoyed at the possibility of having to submit to rules other than those produced by its own members, the Motor Club of Harrisburg (Pa.), after much discussion as to whether it should openly defy the contest board of the American Automobile Association or apply to it for a sanction, for its annual reliability contest, has adopted a middle course. It has notified Chairman Hower of the board that it has decided to hold its annual reliability contest under its own rules and conditions, that it will pay a sanction fee if notified that such a fee is necessary, and that if the A. A. A. rules were before it, it "would be very glad to consider them carefully and adopt from them such suggestions as might be thought applicable"; but that it has as yet received no official notification of the controlling function being assumed by the contest board over all local reliability tests.

This interesting communication was evolved at a meeting of the contest committee of the Harrisburg club on Monday of this week. The rules adopted by the club are practically the same as those employed a year ago. The date of the contest has been fixed for May 3-6, inclusive.

The first day's route will lead from Harrisburg to Washington, vit Gettysburg, Hagerstown, Harper's Ferry and Frederick. On the second day contestants will return to Harrisburg via Baltimore, Westminster, York and Lancaster. On the third day the route leads from Harrisburg to Scranton, following the Susquehanna river most of the way and passing through a number of important towns including Walkes-Barre. On the fourth and last day of the contest, the return will be made to Harrisburg, via Delaware Water Gap, Boston, Allentown and Reading.

Florida Will Have the Beach Meet

Calmed somewhat, by the influence of time and second thought, W. J. Morgan, whose resentment at the mandates of the contest board of the American Automobile Association caused him last week to throw out dark hints of a possible suppression of the Daytona Beach carnival, has quite recovered from the effects of his temporary obsession. At a meeting of the Florida East Coast Association, held Saturday evening last, it was decided to go ahead with arrangements for the meet with the full backing of the club. Threatened financial complications over the A. A. A.'s demands for an assurance of real monetary backing for cash prizes offered, has been averted, as cash for the money prizes has been deposited with the Merchants Bank of Daytona.

BUYERS BUILD THEIR OWN CARS

Features of the "Metz Plan" for Selling Machines in Instalments—Progressive Purchase on C. O. D. Basis.

Finding its market with the big general public, the automobile industry gives the widest possible field for the exploitation of whatever novelty and ingenuity can be introduced in a sales campaign or selling plan, and ideas which promise either to create new classes of customers or win an increased proportion of the already recognized buying elements are at a premium. In this connection a conspicuous and interesting example of a new selling plan, where the product has been made to fit it, has been originated and is being put in operation by C. H. Metz, of Waltham, Mass., who about two months ago acquired the plant of the Waltham Mfg. Co. While involving old principles it presents them in an application which as a whole is entirely new to the automobile trade, among its features of novelty being an instalment payment plan for the retail buyer which eliminates the granting of any credit.

Attracted by an offer which says that "$350 buys this $600 car," in connection with a handsome illustration of a smart looking two seated runabout, the inquirer writes to find out how the "Metz plan" makes the price possible, as he is invited to do by the advertisement. In reply he receives an elaborate typewritten document, bound in a blue paper cover and bearing white ribbons and a gold seal, the whole affair suggesting in appearance either a legal brief or an engineer's report crossed with a lady author's first manuscript. Pasted to some of the twelve long sheets, as interpolations in the text, are half-tone pictures of the car, of the Metz factory, a top view of the chassis, etc., all of which afford the advantages of catalog illustration without impairing the confidential and personal spirit of letter communication which is conveyed.

The plan, or such part of it as directly concerns the "prospect," is made clear by easy stages, starting with the explanation that the "Metz plan car is designed to meet the wants of a mass of people who long for an automobile but are unable or not inclined to invest the amount heretofore required to procure a serviceable vehicle." Convincing assurances are given as to the high quality of the car throughout, and the "plan" itself is given as the thing which makes the low price possible.

The striking and unique feature of the "plan" is then revealed. However much it may resemble in some respects the thriving business which was at one time conducted by various houses in supplying experimenters with frames, motors and whatever other parts they might order, it differs radically in that the customer enters upon an agreement for taking the whole machine in installments of regular and fixed order, from which he cannot deviate although he may take whatever time he pleases between installments. Thus he not only purchases, but receives his machine on the installment plan.

"By the Metz plan," the document goes on, "you become partly the producer of your own car. Every piece of the machine, down to the smallest nut and washer, is furnished from the factory, and the different parts, such as wheels, motor, transmission, etc., are assembled at the factory. These parts are shipped to you in groups, from time to time, and you set up the machine, putting it together.

"You may begin to obtain a Metz plan car," says the document, a little further on, "if you have only money enough to buy the first group of parts, and you may secure parts as fast as you require them, or as slowly as you wish. By paying for each group of parts as received, you do not feel the great expense of paying for a car as a whole."

After a very complete presentation of the economies that are effected in production by having the customers themselves assemble and paint their machines, calculated to show that the low price is only possible by this plan, the car itself is taken up exhaustively and practically every inquiry that could suggest itself in connection with it is answered, while the most minute detail specifications of its construction are supplied.

"Send us $25," the customer is advised, "and we will enter your order and ship to you by express or freight, as you desire, the first group of parts, consisting of frame reaches, cross members, motor hangers and bolts, together with the necessary tools for putting these parts together. Explicit instructions and illustrations are included so that you will not have the slightest trouble in putting the parts together.

"The second group of parts consists of springs and axles. You may send for these whenever you are ready. The price on this group is $25 and full instructions and illustrations accompany them as before. So on down through the list.

"Remember, the motor, transmission, shafts, wheels, magneto, carburetter and all parts are assembled as units at the factory. You simply put them in place in the same manner as you would a wheel on your buggy or handle bar on your bicycle. There are no holes to drill, no filing or fitting. You simply put things together. You continue to send for each new group of parts as rapidly as you get the previous one built up. You may wait six months if you wish, drop out altogether, or transfer your interest to someone else, and we will continue to supply the additional parts as you may direct."

Fourteen groups of parts, at $25 per group complete the machine, and fittingly enough the last item in the last group is the starting handle. The details of the groups are given as follows: First group, frame reaches, cross members bolts, nuts and all tools; second group, springs and axles; third group, hood, dash and front radiator screen; fourth group, body, floor and dash enclosure; fifth group, seat and chest in rear; sixth group, control levers, fenders, running boards, paint, finishing materials and brushes; seventh group, hubs and wheels; eighth group, tires; ninth group, countershaft, friction disc, sprockets, chains and bearings; tenth group, propeller shaft, friction plate, bracket, bearings and fly wheel; eleventh group, wheel steering gear and connections; twelfth group, motor; thirteenth group, magneto, gear cover and timing gears; fourteenth group, tank, carburetter, muffler, pipe connections, lamps, horn and starting handle.

"These groups," it is explained, "cannot be purchased except in regular rotation at the rate of $25 for each group. If you wish us to assemble the car complete, we can arrange to do this. The price of the car complete and assembled is $600.

So thoroughly has every detail of the plan been provided for that even the question of a suitable place for assembling the car is given attention. It is claimed that any room of ordinary dimension—9 feet by 12 feet for example—would be sufficient, and in case no suitable room is available, a portable garage, complete and ready to set up, will be furnished for $25, or the materials and plans for such a garage will be supplied for $17.50. In large cities, where no room is available and no suitable place for setting up a small garage can be secured, the factory proposes to arrange for a large room where a number of purchasers may operate.

To give a dealer a chance at the business, certain concessions are made in case he will undertake to supply assembling space of this character, where customers may either assemble for themselves or where he may do the work for them, charging them accordingly. It is also pointed out that there would be a market for the complete cars assembled by the dealer himself for purposes of retail sale.

The complete car is rated at 10 horsepower, having a two cylinder, air cooled motor, the cylinders being opposed and offset, with 3¼-inch bore and stroke. The transmission is a simple friction drive from a composition plate at the rear end of the propeller shaft to a fiber sliding ring on the counter shaft, the latter having a differential, and driving with sprockets and roller chains to the rear wheels. For ignition, the Bosch magneto high tension system is used. The frame is of pressed steel, U section, for the sides and has tubular cross members, while the body is a skeleton covered with aluminum, with double bucket, upholstered seats. Full elliptic springs are supplied front and back, and wire wheels, fitted with 28x2½ detachable clincher tires, are the regular equipment, although artillery wheels are supplied as an option at extra cost. The total weight is given at 450 pounds, and the speed as from 2 to 40 miles per hour.

OSCILLATING CYLINDER MOTOR

Adaptation of the Principle in a British Design—General Specifications and Details of Its Operation.

For many years in the steam engineering field the possibilities of the oscillating type of engine, or that in which the usual connecting rod was dispensed with in favor of the solid connecting rod coupled directly to the crank shaft, were considered very strong. Many different types of oscillating engine were built and a few isolated examples of the practice still are extant. Hitherto in the gas engine field, little or nothing has been done with this class of motor, but a precedent has been established in this respect in a recent British development known as the M. D. S. engine, in which the oscillating cylinder principle is adopted with such modifications as are made necessary by the use of the four-stroke cycle principle of action.

In any oscillating engine, the cylinder, instead of being positively mounted on the base or crank case, is given a trunnion mounting, as a result of which it swings back and forth to accommodate the transverse "throw" of the crank, this motion of the cylinder giving to the engine its name. In consequence of this formation, the wrist pin construction for piston or cross head is eliminated and a rigid connecting rod and piston combined is secured, in addition to which, the overall length of the engine is considerably reduced so that the resulting motor is very compact. With steam engines of this stamp it was customary so to arrange the trunnions, through which the live and exhaust steam were passed, that the rocking of the cylinder caused the steam ports to be opened and closed, all external valve mechanism thus being done away with, and the machine being rendered very simple in this way. In the gasolene engine under consideration no such simplicity is possible, the distribution of the gases, instead, being effected by the aid of a rotary movement of the piston itself, through which suitable ports are cut.

The accompanying illustrations show the general arrangement of the engine and its mounting, and also a development or flat plan of the piston and its ports, showing their construction and arrangement. The absence of valves of the poppet type, it will be observed, places the motor in the same general class with the Knight engine. At the same time, the manner in which the details have been worked out, as well as the general plan of the engine as a whole are so radically different from that of the new Daimler product that the two are hardly to be considered as in the same class save in the one respect that the distribution in both cases is controlled by means of sliding sleeves.

The cylinder is water jacketed in the usual manner and has the intake and exhaust ports formed directly in it. The most striking departure from usual practice is in the construction of the piston, which has a long sleeve-like extension running well up to the head of the motor, and passing between the cylinder wall and a cartridge-like extension of the head, which thus provides a deep groove to take care of the over-travel. In this extension of the piston, the valve ports are formed. In the first of the two accompanying illustrations the sleeve is indicated at C, and the cylinder heat at B. The lower end of the head, which is dome-shaped, is protected from gas leakage by means of the three packing rings, D. The top of the piston is covered by the disc valve, E, which is carried on a central stem, F, which, in turn, is carried down a central hollow in the center column, M, and attached to the crank pin bearing or "big end" at N.

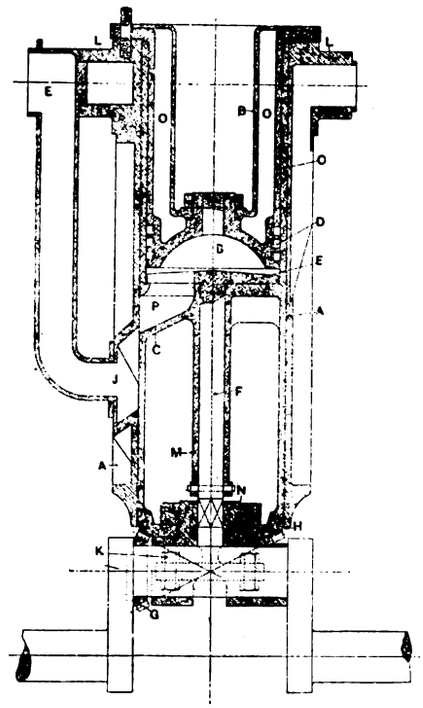

Fig. 1

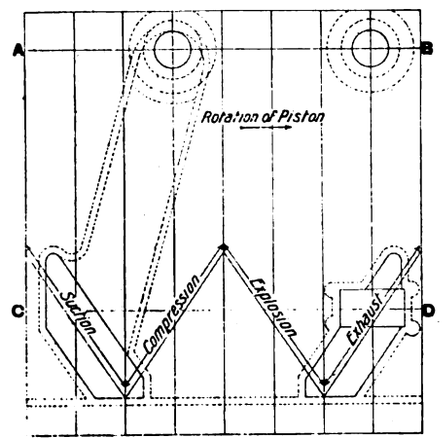

Fig. 2

A bevel gear, H, is attached to the open or lower end of the piston, which meshes with the corresponding bevel, G, attached to the crank web. The relation between the diameters of the two is such that the speed ratio is two to one, the distribution effected by the rotation of the piston thus brought about, being the same as with the two-to-one gearing of the ordinary type of motor. As the crank shaft rotates, the cylinder rotates on the trunnions, L-L, the piston being compelled to turn in consequence.

In completing the cycle, the piston first draws in its charge on the down stroke, through a port, not shown in the illustration, at the same time rotating one quarter of a turn about its axis. This movement is sufficient to close the intake port, by the movement of the piston under the stationary disc, so that the succeeding up-stroke effects compression in the usual manner. During this, and the firing stroke which follows, the rotation of the piston continues, but neither of the ports is opened until the fourth stroke, when release occurs and the exhaust takes place, through the exhaust port, J.

Among the advantages claimed for this system are that as the piston oscillates, the line of piston pressure is always perpendicular to the crank, so that there is an absolute elimination of wall thrusts; the absence of separate valves and actuating mechanism is held to conduce to reliability in action; the piston port, P, being common to both exhaust and inlet functions, it always is kept reasonably cool; while in the matter of lubrication, the combined effects of its rotation and the absence of wall thrust are held to cause it practically to float in oil. In regard to the valve motion, it is further pointed out that although mechanically operated, the valves are not compelled to open against pressure, as a result of which the amount of "engine work" or energy absorbed internally, is considerably reduced.

The M. D. S. engine, is produced by the Mechanical Development Syndicate of London, under whose hands it has been perfected. Its structure is sufficiently radical to warrant it serious study and its mechanism is ingenious enough to be creditable to its makers; at the same time, the practical disappearance of the oscillating engine in steam practice, upon which gas engineering depends so strongly, would not seem to argue any too favorably for its success in practical ways.

Use of Funnel in Draining Radiator.

Some radiator drain pipes are placed directly over the front axle in such a position that when opened the water will strike the axle and splash around wetting things generally. If a funnel be used to direct the water into the pail the shower bath effect will be avoided and the floor kept free from water.

MAKING APPRENTICESHIP BROADER

System of Scholastic and Manual Training on Trial at the Locomobile Factory—Its Satisfactory Operation.

Frequent complaint has been made that the methods of instructing learners in the more common trades are not as thorough as they used to be on the one hand; and on the other, that it is far more difficult than it used to be to secure good material from which to develop an intelligent and skilful class of workmen. For this condition of things the decadence of the old-time apprenticeship system is responsible in part, and in part, inevitable conditions in the modern shop where rigid economy forbids in many instances, the generous shifting about of the learner from job to job which used to result in a breadth of education which now is practically impossible. In many shops in fact, the training of mechanics has declined into a system of drilling operatives fitted for only a very limited class of labor.

Systems galore have been devised to overcome this difficulty, but perhaps none is more promising in a general way that that which has lately been put into operation in Bridgeport, Conn., where apprentices from the plant of the Locomobile Co. of America and a number of other shops are regularly "sent to school" during certain stated periods of every week for the express purpose of broadening their education in subjects related to, if not directly in line with those which they are acquiring in the regular shop instruction. The benefit thus secured is two-fold. It tends to increase the interest and fidelity of the pupil, and it also serves to attract to the work a better class of beginners than would be drawn to it were the training less diversified.

In the old days of the hard and fast apprenticeship system a boy's choice lay between becoming an artisan or a scholar. There was no half-way between. In order to become master of any of the arts and trades a youth must serve from four to seven years apprenticeship, and the duties imposed upon him during that period were such as to preclude the possibility of his having either time or energy left to persue the less thorny paths of learning after his daily tasks were done. More recently the articling of boys in the various trades has languished through the combined influence of the attraction presented by the lighter and more "genteel" clerical positions which always are available and the impression that the learning of a trade ties the workman down to a very narrow sphere of life. The value of the indenture has become much impaired at least so far as the giving of thorough, broad and practical instruction to the apprentice is concerned, through a combination of circumstances depending mainly on the tendency to specialization.

The Locomobile Company of America

By this DIPLOMA Declares

That _____ has completed the Prescribed Course of Three Years of Apprenticeship in their factory at Bridgeport, Connecticut, at the

MACHINISTS' ART AND TRADE

and is entitled to recognition as a Graduate Apprentice.

IN WITNESS WHEREOF, we hereunto set our hand and the seal of

The Locomobile Co. of America

This _____ day of _____ 19__

By _____ Superintendent

In the place of the boy of old who was brought up in his chosen calling has come the graduate of the trade and industrial school who has brought with his superior mental training and general knowledge of the craft less of mechanical proficiency and withal an inaptitude at learning the finer details of handiwork in many instances, and a desire to forge ahead which unfitted him for routine work of the better sort. On this account it often has been difficult for the manufacturer to obtain a good class of employes among the younger element who were fitted to develop into permanent and trustworthy operatives.

One solution of this difficulty and one of the more promising yet advanced is that of the combined trade and general education such as may be obtained where suitable night-schooling is provided for the working classes. But even this fails except where a proper spirit of progressiveness and ambition prevails in sufficient degree to induce those who most require it to attend the night classes.

An even better system is that in which the scholastic and manual training is carried on simultaneously; where apprentices are directly supplied with the means of improving their minds while learning their trades and without necessarily prolonging the working day to the point of exhausting the pupil, either mentally or physically.

Such a system is that in force in Bridgeport, where practically all the factories which maintain apprentices are under agreement with the industrial department of the local Young Men's Christian Association to maintain special classes for their instruction. By contributing regularly to the support of the institution in proportion to the amount of instruction received the latter is put on a self-supporting basis, while the employers, in turn, are able to figure a profit on the transaction by offering to candidates a broader training both in shop instruction and general education than would obtain under the old order of things.

Particular interest is found in the system because of its adoption by the Locomobile Co., which has just graduated its first apprentice under the new system. The plan is applied to both machinist's and pattern-maker's apprentices. All regular three years apprentices in these trades "go to school" two hours a day, some in the morning and some in the afternoon, four days a week. But by a suitable arrangement of hours and a "staggering" of the days, it is made possible for this to go on without interference with the regular work of the shops and without seriously breaking into the routine of shop instruction which, of course, is the most important part of the educational process from the employers' standpoint.

The school tuition includes courses in simple arithmetic, algebra, mechanical drawing in its various branches, the higher classes of geometry. Grammar and kindred studies of a general nature also are taught. Each graduate apprentice receives two diplomas, one of card size, which is given him in a leather pocketbook, and the other of large size, suitable for framing. The latter is reproduced herewith. The school has been in operation some four months and promises to be a success.

Belgium's Foreign Trade Increases.

The value of the foreign motor cars and parts imported into Belgium during last year totalled $724,520, as against $874,740 in 1907. The exports, on the other hand, jumped from $2,198,280 in 1907, to $2,246,860 for last year.

WHEEL-TAX AGAIN DECLARED LEGAL

Illinois Supreme Court Upholds Chicago's Shake-Down by Majority Decision—Fight Goes to Federal Court.

Again the automobilists of Chicago have lost in their fight against the right of the city to impose extra taxation upon them under the provisions of the so-called wheel-tax ordinance which has been in effect since May, 1908. The city already has derived from this source a total of $700,000, and the money has been expended in improvement of the streets. The question of the legality of the ordinance has been carried from court to court by the Chicago Motor Club and the Chicago Automobile Trade Association, finally reaching the Supreme Court of the State. In these latest proceedings William H. Arthur, counsel for the two organizations named, based the appeal against the decisions of the lower courts on the ground that the wheel tax ordinance clashed with the State motor vehicle bill. Another point he raised was discrimination, in that while a tax was exacted from two, three and four passenger automobiles, motor cars with seats for only one person, motorcycles, tricycles and bicycles were not included.

Upon the first point specified Mr. Arthur was sustained by Chief Justice Cartwright, who, with Justice Dunne, dissented from the decision of the five other justices, who sustained the legality of the ordinance. The Chief Justice said in his dissenting opinion that "the act and ordinance are in irreconcilable conflict, which is not obviated or removed by regarding the act as a regulation under the police power and the ordinance as an exercise of the taxing power. The validity of the act is not questioned and being a vital act relating to motor vehicles it has not been repealed by the general act amending the city and village act. The general act gives cities and villages power to direct, license and control wagons and vehicles conveying loads and says nothing about taxing vehicles. But, regarded in any light, the ordinance conflicts with the motor vehicle act."

Having fought the matter to the last ditch, as far as the Illinois courts are concerned, the motorists of Chicago were disposed to accept the decision, rendered some two weeks ago, as a finality. There remained to them, however, the privilege of appeal to the United States Supreme Court. This step was decided upon at a joint meeting of the Chicago Motor Club and the Chicago Automobile Trade Association, held on the evening of February 26th. At that meeting it was voted to appoint a committee to get in touch with all owners of motor cars in the State and raise funds to carry the case to the United States Supreme Court. It will not be difficult to present to automobilists in other portions of the State some urgent arguments why it will be wise to make common cause in knocking out the Chicago ordinance. In fact, before this joint meeting was held the city council of Peoria, undoubtedly inspired by the Supreme Court's decision, permitted the introduction of a vehicle ordinance providing for wheel tax. No amounts are named in the measure. Various vehicles are divided into classes as follows: One-horse, two-horse, three-horse, four-horse, six-horse or more, automobiles for two, automobiles for more than two, other automobiles, trucks, coaches, omnibuses. Blanks are left for inserting the amount to be taxed. This is one of the measures proposed in meeting a shortage in municipal revenue which the city has been experiencing. It was referred to the police and judiciary committee. The action of that committee will undoubtedly be influenced to some degree by the consideration, "we need the money."

Sheriff to Motor on Midnight Raids.

Around the county jail there is generally an air of subdued excitement once in a while, when, as evening approaches, the sheriff and several of his picked assistants prepare for a night journey out into the dark wilds of the country. Sometimes the sheriff takes a buggy, sometimes a trolley car, and occasionally a jerkwater way train. Only too often he comes back with his shoes loaded with mud, but his hands empty of prisoners, because somebody in touch with the sheriff's office affairs has "tipped off" the cock-fight promoters by means of a speedily dispatched messenger. Sheriff Jerge, of Buffalo, N. Y., has decided that a motor car is a necessary part of the equipment of his department to stamp out cock-fighting, and is arranging to use a machine for such expeditions in the future. "There will be no more fruitless cross-country walks by moonlight," he declares, "as we shall hereafter go out for business with the complete outfit."

Heavy Cop's Hurry Ride Costly.

Being the second largest policeman in Seattle, Wash., it is naturally borne in upon Patrolman I. Bjornson that he is probably pretty heavy, as well, but he finds it hard to believe that a short, three-block ride which he took in an automobile delivery wagon of the Golden West Baking Co. is the sole cause of the machine breaking an axle, for which he is now asked to pay. The patrolman was sent from the station house on the run, it being reported that a man had fallen into the bay. The delivery automobile was going in the direction of the scene, and the officers asked for a ride. Within a short distance the axle broke, and he had to run the rest of the way on foot. The machine was in the garage six days, and the bills piled up to $110.30. The baking company sent the bill to Bjornson and he has turned it over to the city of Seattle for the law department to handle.

ENFORCES LAW AND RUINS HIMSELF

Squire Van Ness Finds He Cannot Apply Fines to Paying Police—Legislature is Asked to Reimburse Him.

"This business of speeding on the public roads is going to be stopped if it costs me all I have." Such, in effect, was the declaration of Jesse P. Van Ness, the justice of the peace at East Greenbush, N. Y., when he set himself to the task of holding motorists down to reasonable speed on the portion of the Boston and Albany turnpike passing through that town. He accomplished his purpose and it cost him the limit. Now the legislature is asked to relieve him of the burden his efficient execution of the law has imposed upon him. The road up there is fine for "opening up" and it was only the sanest of sane drivers who could resist the temptation to "let 'er out another notch." But Squire Van Ness was on his job. He spent his efforts well and truly, and in a short time the turnpike became one of the most reputable in Rensselaer county.

In constructing his system he engaged help. He had to have extra men. He couldn't do it alone. These highway protectors had to be paid. They worked night as well as day, and were willing to get up at any hour. They caught the violators, and when the occupants of the cars were apprehended they would be arraigned before the justice of the peace and he would name the penalty. He was severe and the punishment for a second offense was a big help to the system. Anyway, he collected in fines something more than $900, and he expended from this fund $716.87 in payment of his impromptu police force. There was a balance on hand and this had to go with the rest.

But Squire Van Ness had no right thus to dispose of the money. This was made plain to him in due course of time and he had to mortgage his home in order to make good to the town authorities the amount he unwittingly had misapplied, and which the town authorities promptly appropriated to other purposes. Now, however, Senator Victor M. Allen, of Rensselaer, has introduced in the senate a bill to reimburse him.

Spare Tires Serve as Bail.

Tires as bail represents the accommodating spirit in which the desk officers of the New York police force try to make the path of legal procedure smooth for motorists after the latter have been arrested on charges of speeding. Harold Dannot, a chauffeur, was recently taken to the Bergen street station for violation of the speed law, and as he had no money the lieutenant accepted two spare "shoes" or casings, valued at $50 each, as security for letting him go.

CLUB AMALGAMATION PLAN HALTS

Bay State Automobile Association and Boston Motor Club Fail to Agree—Latter to Remain in the Field.

Negotiations have been in progress for some time past with the aim to bring about an amalgamation of the Bay State Automobile Association and the newly organized Boston Motor Club, which is largely composed of former Bay State members. The proposed coalition contemplated the foundation of a new and third body to absorb both the Bay State A. A. and the Boston M. C., the name of which would be decided by a joint committee chosen from both clubs; that the dues of the new organization should be fixed by the members of the new club at their first meeting, and that if they are less than the present dues of the Bay State A. A. rebates would be granted to the members thereof. It was further proposed that the Bay State A. A. turn over its present quarters, assets and equipment to the new organization.

The proposed agreement was ratified by the Boston Motor Club, and was placed before the Bay State A. A. at a special meeting, held Tuesday evening, February 23, to consider the matter. Many members of the older body expressed the opinion that it had made all the concessions that could be made, and objected to giving up their organization and possibly their name. At this meeting another committee was appointed, but it was authorized only to invite former members of the Bay State to rejoin the older club, with the understanding that the Bay State eventually would take in the members of the Boston Motor Club who were not previously associated with the Bay State. This plan was put before the committee of the Boston Motor Club, which refused to consider it, with the result that unless further steps are taken by the Bay State the Boston Motor Club will become an actuality.

Long Island Club Leases Larger House.

As a result of their negotiations, the Board of Governors of the Long Island Automobile Club, of Brooklyn, the club has leased the premises at 918-922 Union street, facing Prospect Park Plaza, for their new quarters, made necessary by the outgrowth of the present quarters.

The building is 50x95, four stories high, with basement; the latter has a concrete floor, is of the same area as the other floors and will provide accommodation for 150 cars. An elevator, large enough to accommodate any size car, is provided. The top floor of the building will be used for a repair shop, and is fully equipped with machinery and tools to meet all requirements. The club rooms will be located on the second floor commanding an excellent view of the Plaza, and will be put in condition for occupancy very shortly. Applications for space in the new garage are now being received.

New Haven Club Spoils a Graft.

Because of a bad stretch of road near Woodmont, Conn., in which many cars have become mired, a farmer in the vicinity has been resorting to the old method of getting rich quick by towing the cars to firm ground. As his income was in the neighborhood of $100 a month from this source, it is safe to say that he does not harbor any brotherly love for the New Haven Automobile Club, which thought it high time such extortion should cease and took steps accordingly. Large warning signs have been erected at either end of the bad stretch, advising motorists that the road ahead is impassable and pointing out another route which will avoid the quagmire without loss of additional time.

Waterbury Organizes a New Club.

In response to an invitation sent out by A. C. Judd, who takes a pronounced interest in automobile matters, over fifty of the representative business and professional men of Waterbury, Conn., were convened in Hotel Elton, on Saturday evening last, 20th inst. The outcome of the meeting was the founding of the Automobile Club of Waterbury. Formal organization resulted in the election of these officers: J. Richard Smith, president; John B. Bunall, vice-president; Almon C. Judd, secretary; Henry A. Hoadley, treasurer. Board of governors, until annual meeting, Edmund J. Daly and William H. White; board of governors to serve until 1910, Louis E. Fitzsimmons, Edward M. Beach and John P. Kellogg.

Virginia Association Re-elects Officers.

At the annual meeting of the Virginia Automobile Association at Richmond last week, the old officers were re-elected as follows: J. E. Willard, president; Abbott Morris, first vice-president; J. H. Marsteller, second vice-president; O. M. Alfriend, secretary-treasurer. The Automobile Clubs of Lynchburg and Staunton were admitted to membership and a committee to attend the national good roads convention was appointed.

Showing the Way to Muskegon.

As the first step in its campaign the newly organized Muskegon (Mich.) Automobile Club will erect signs at all crossroads within a radius of one hundred miles. The signs will read "This way to Muskegon," and care will be taken to see that they point in the right direction.

Signposts for Transcontinental Tourists.

The Automobile Club of America will lay out a transcontinental route and erect signposts along the way during the coming summer for the benefit of coast to coast tourists.

RIVAL CLUBS FOR PHILADELPHIA

Quaker City Seceders Join Century Club—The Old Time Cycling Body Becomes an Automobiling Organization.

Following close on the heels of the annual meeting at which new officers were elected, and where symptoms of discord were apparent, a large defection has occurred in the ranks of the Quaker City Motor Club of Philadelphia. The seceders have joined the Century Club, one of the most famous cycling bodies in the country in the palmy days of the wheel, but of late years, more prominent in social affairs. By a unanimous vote, the club placed itself on record to change its name to the Century Automobile Club, admit a large number of applicants and promote the sport of automobiling by contests and otherwise.

During its 24 years of existence, the Century Wheelmen, and later the Century Club, has been a commanding figure in everything that pertained to the cycling or club world. Its annual runs and race meets were famous throughout the land, and attracted riders who were famous on both continents.

It owns a $40,000 club house on Philadelphia's leading thoroughfare, which affords an alluring rendezvous for motorists.

L. D. Berger, who was recently elected president of the Quaker City club issued a statement to the effect that the reported dissatisfaction and withdrawal of a large number of members from the club was an exaggeration, and while admitting that in a few instances members of the Quaker City Motor Club have become affiliated with the Century Automobile Club, the policy of the Quaker City club would remain unchanged.

Columbus Plans Sign Raising Day.

Some time ago the Columbus, (O.) Automobile Club decided to institute a signboard campaign and ordered one hundred galvanized iron signs with which to begin the work. The signs have now arrived and as soon as the roads are in good shape for motoring a "sign raising" day will be declared. Members and machines will be impressed into service to carry on the work. The signs bear the name of the Columbus Automobile Club and the number of miles from Columbus to the next largest city.

Marking Roads Centering at Chicago.

The Chicago Motor Club has taken up the work of erecting signposts on the prominent routes leading out of Chicago, within a radius of one hundred miles. Three of the routes which are most frequently used by automobilists—the Milwaukee, South Bend and Lake Geneva roads—will be placarded with substantial iron signboards. A large fund has been raised to carry on the work, and the signs have been ordered.

CONDEMN TAXATION OF TOURISTS

Associated Automobile Clubs of New Jersey Ask for Courtesy to Non-Residents —They Approve the Colgate Bill.

That the taxation of non-resident motorists for occasional use of the roads of New Jersey is "small, narrow and restrictive," was the unanimous opinion of members of the Associated Automobile Clubs, as expressed in a resolution adopted by them at a meeting held in the Essex Troop Armory, Newark, on Thursday evening, 25th ult. The meeting was presided over by W. Clive Crosby, of East Orange, president of the Associated Clubs, and the organizations represented were the New Jersey Automobile and Motor Club, the Middlesex Automobile Club, of New Brunswick, the Automobile Club of Hudson County, the North Jersey Automobile Club, and the Mercer County Automobile Club. The resolution adopted reads as follows:

Resolved, That the amendments as contained in Assembly bill No. 119, amending the automobile laws, is in accord with the ideas of the Associated Automobile Clubs of New Jersey and should be enacted into law with these changes: No charge of $1 should be made for the license to be granted the non-resident on the grounds that it is unnecessary, does not add to the safety of the State nor materially add to its income, and that a policy exacting $1 from a non-resident is small, narrow and restrictive. The State should provide, free of cost, the license or certificate proposed to be required by the State of non-residents.

The bill referred to is known as the "Colgate automobile bill," a summary of which has been presented in these columns, which is much more liberal in its provisions than the existing law. It has been reported favorably by the highway committee.

Minnesota Club that Does Things.

Evidences of its aggressive policy were manifested at a recent annual meeting of the Rochester (Minn.) Automobile Club when it was unanimously voted to join the State association. The club rescinded its former action against the Gates automobile bill and gave its indorsement to the measure. As an indication of its efforts for better roads the club maintains eight log drags at various points in the country and they have proven of great value in aiding to maintain the highways.

Detroit Plans for a Working Club.

Because of the fact that the Detroit (Mich.) Automobile Club is a social organization of an exclusive nature and does not take an active part in motoring affairs, plans are on foot looking to the formation of a new automobile club. The need of a downtown club that would bring motorists together and play a prominent part in the enactment of equitable laws and assert itself in the good roads movement, is admitted on all sides. The movement has the hearty support of the Detroit Automobile Club and the D. A. D. A., as the dealers' association is known, each of which has a sphere of its own with which the new body will not conflict. It is proposed to admit to membership every motor car owner in Wayne County, and to have an associate membership for owners residing outside the county. As there are over five thousand owners in Wayne county it is confidently expected that the new club will take the field with a large initial membership.

Washington's Subway to Have Electrics.

Comparatively few visitors to Washington, the National Capital, know that from the new office buildings of the house of representatives and the senate, respectively, to the capitol building, there is a big subway, having sidewalks and a road for vehicles. So far all the traffic through the subway system has been only foot passengers and rubber tired push carts, but arrangements are being made for the introduction of electric automobiles. It is planned to use vehicles of special types, suitable for the service, one style for passengers and another for the transporting of books, records and merchandise.

Chief Kohler Wants Motoring Police.

Radical changes in police methods, made possible by the automobile, are proposed by Fred Kohler, chief of police in Cleveland, O. "The day of patroling the city is past," he declares, in asking for 15 motor cars for his department. "You might as well send out fire engines to look for fires. I would abolish beats, put six or more policemen in each automobile and cover a huge territory, circling and bisecting it several times nightly and dropping off policemen where conditions seemed suspicious."

Hotel Men Encourage Automobiling.

Hotel men know which side their bread is buttered on and regard with distinct disfavor anything which is calculated to lessen the touring activities of motorists. Up in Maine, particularly, the automobilist who tours with his machine in summer is highly welcome, and at a recent meeting of the Maine Hotel Proprietors Association, held in Brunswick, that body adopted a resolution to encourage automobile visitors as much as possible and to work for state legislation favorable to the motoring interests.

Commits Murder to Become a Chauffeur.

So alluring are the advertisements of the automobile "schools," where chauffeuring and its allied arts are taught and from which the "graduates" emerge with hopes of fat salaries and easy berths, that Orville Foland, 19 years old, committed murder last week to get the necessary tuition money to put him through. He killed Jesse Haymaker in Hutchinson, Kan., on Wednesday, and got a life sentence on Friday.

MAKING WRECK TELL ITS STORY

How a Milwaukee Professor Estimated the Speed Which Caused a Disaster—Curious Technical Calculations.

Even when the victims have been killed outright and there are no witnesses to an accident, a great deal of accurate information as to the circumstances of an automobile disaster may in most cases be learned by technical calculation, according to Professor Warren S. Johnson, of Milwaukee, Wis. As an instance of the possibilities in this direction, he recently undertook to analyze an accident where a machine went through an open draw bridge, killing its occupants in the river below. After determining the distance from the abutment at which the car fell, and ascertaining that the vertical fall was 16 feet, he shows the method of arriving at the speed of the car.

"Bodies fall 16 feet the first second," he explains, "so that the machine was one second in striking the water after leaving the bridge. If the machine struck the water 26 feet from the abutment, it was running at 18 miles an hour when it left the roadway edge. The machine would not go very far forward after striking the water, owing to the resistance. If the machine was found nearer the shore than this, it was running at less than 18 miles per hour. If at the time the car went into the river, the brakes had been applied, it must have been going in excess of 18 miles an hour previously on the street. Had the brakes been applied 50 feet from the edge, at 18 miles an hour, they would have stopped the machine in time. At five miles an hour the car would have dropped practically directly downward."

Automobile Study for Farmer Students.

That agricultural colleges and schools are now giving courses in automobile matters to their students, as part of the curriculum which is to prepare them for their practical duties in life, constitutes a prophecy of how large the part of the motor car will be in farm life of the future and also indicates the present interest which the more enterprising farmers feel in the motor propelled vehicle. Short course students at the Iowa State College, at Des Moines, whose studies are chiefly on agricultural subjects, are to have an automobile lecturer from Thomas B. Jeffery & Co., of Kenosha, Wis., while the Michigan State Agricultural School, at Lansing, Mich., is to have a special course of instruction on automobile operation, maintenance and repair.

Kansas City Chauffeurs Get Together.

Emulating their brethren in other cities, the chauffeurs of Kansas City, Mo., have united, and the aggregation will be known as the Automobile Mechanics Association of Kansas City.

The Week's Patents.

903,213. Fluid Gauge. Morris Martin, Boston, Mass. Filed April 13, 1907. Serial No. 368,050.

1. A fluid gauge comprising a head, a pivotally mounted magnet, a float, operative connections between said float and the magnet whereby the position of the magnet is determined by the fluid level, an indicating magnetic needle revoluble at times in unison with float induced movement of said magnet, means to sustain the needle in the head, and means rendered operative at will to temporarily lock the needle and restrain it from revoluble movement, the magnet remaining free at all times to change its position in accordance with variations in the fluid level.

903,447. Vehicle Axle. Hazel B. Bush, Littleton, Colo. Filed June 25, 1906. Serial No. 323,195.

1. In a vehicle, the combination with the body of the vehicle, of a main axle member and an auxiliary axle member, the body of the vehicle being supported upon the latter, and the two axle members being yieldingly connected whereby the auxiliary member has a limited degree of independent vertical movement, and the auxiliary axle construction also being provided with buffers located both above and below the main axle member.

903,608. Wheel for Motor Vehicles. John V. Pugh, Allesley, England. Filed Aug. 10, 1907. Serial No. 388,013.

1. A wheel for motor vehicles comprising a permanent hub part, a removable hub part enveloping said permanent hub part and carrying the spokes and felly, clutch members between and formed integral with said hubs, a holding nut and locking means carried by and inclosed within said nut.

903,657. Explosion Turbine. Carl Beckmann, New York, N. Y. Filed Dec. 19, 1905. Serial No. 292,519.

1. In an explosion turbine, in combination, a rotor, a stator having an explosion chamber with an inlet opening adjacent to said stator, said rotor having a carburetting chamber therein and having an inlet port in alignment with said opening, said stator having an explosion port leading from said chamber, said rotor having buckets to receive the force of the explosion and ignition devices carried by said rotor and aligning with said inlet port and said explosion port.

903,707. Manufacture of Rubber Tires. James T. Gordon, Indianapolis, Ind. Filed Feb. 12, 1908. Serial No. 415,471.

1. In a device of the character described, a casing adapted to completely envelop a tire, comprising opposed members semicircular in cross section assemblable to form a hollow annulus, and means for locking said members in the assembled relation, comprising a plurality of locking pins upon one edge of one member, and a corresponding plurality of keeper loops upon an edge of the opposed member.

903,708. Vehicle Wheel. George H. Groth, Cincinnati, Ohio, assignor of one-half to Auta N. Groth, Cincinnati, Ohio. Filed May 26, 1908. Serial No. 435,048.

1. The combination with a steering axle having a body, a steering knuckle and a spindle, of a vehicle wheel having a hub mounted on said spindle and independent of said steering knuckle, a rim disposed in a plane including the pivot of the steering knuckle, and a plurality of separate spokes connecting said hub and rim and each bent to form a compound curve.

903,714. Pneumatic Tire Casing. Charles G. Hawley and Erle K. Baker, Chicago, Ill. Filed April 11, 1908. Serial No. 426,495.

1. A tire casing provided with inwardly extending base portions which substantially meet at their inner edges and have endless metal rings embedded in their outer parts and co-operating fillers embedded in their inner parts, said rings being vertically elongated in cross section, as and for the purpose specified.

903,745. Tread for Pneumatic Tires. Charles G. Hawley and Erle K. Baker, Chicago, Ill. Filed April 11, 1908. Serial No. 426,496.

1. A pneumatic tire having a tread portion composed of alternated portions differing in elasticity, the portions of least elasticity being spaced about the tread at distances substantially corresponding to the length of the longitudinal line of normal contact between the tire tread and the road surface, substantially as described.

903,741. Valve Gear and Internal Combustion Engines. Herbert F. Lloyd, Sutton Coldfield, near Birmingham, England. Filed April 26, 1907. Serial No. 370,533.

1. In combination in an internal combustion engine of the constant pressure, an annular shell acting to produce an axially moving fluid annulus insulating the flame and hot gases from their inclosing walls; as and for the purposes set forth.

903,744. Frictional Power Transmission Device. Ebenezer H. Manning, Elkhart, Ind. Filed Oct. 18, 1907. Serial No. 398,111.

In a frictional power transmitting device the combination of a driving shaft carrying a friction disc, a pair of oppositely disposed rotary transmission discs for co-operation therewith, a transmission shaft supported in longitudinal alignment with the driving shaft, a sliding sleeve on said transmission shaft, and a frictional transmission wheel comprising a main disc provided with a hub extending beyond opposite sides thereof and integral with said sleeve, supplementary discs mounted upon the hub on opposite sides of said main disc, differential gearing connecting the discs, annular retaining rings having smooth surfaced openings receiving the ends of the sleeve, said rings being arranged to bear against the outer ends of the hub and outer faces of the supplementary discs to retain the latter in operative relation to the main disc, and fastenings passing transversely through said rings into the ends of the hub.

903,746. Pawl Transmission Gear for Taximeters. Charles Mascart, Paris, France. Filed Jan. 15, 1908. Serial No. 410,991.

1. Transmission means of the type set forth, comprising, in combination, a driving ratchet wheel and its shaft, a driven ratchet wheel and its shaft, said shaft being parallel, a member connecting said ratchet wheels to drive the latter from the former, said member comprising a lever pivoted midway of its length and provided with a tooth at one end to engage said driving ratchet wheel and with a pawl at its other end to engage said driven wheel, said tooth and said pawl engaging said wheels at corresponding sides thereof, and a spring for holding said lever with its toothed end in constant engagement with said driving ratchet wheel.

GROWING

¶We have outgrown our present quarters.

¶To accommodate our steadily increasing business and to give our stocks sufficient show space, we needs must spread out.

¶Accordingly, we have leased, for a long term, the building at 215-217 North Broad Street (the property immediately adjoining our present Philadelphia store), which, after extensive alterations, we will occupy on April 1st.

¶This new building will give us 12,000 feet of floor space for the display of our wares.

¶We invite every reader of the Motor World to call on us in our new quarters and personally inspect our stock. We'll show you lots of new and interesting things.

¶If this is impracticable, let us send you our new 1909 Catalogue. It's a store in itself.

¶Don't forget we are distributing agents for Continental Ready-Flated Tires and Demountable Rims. They are the standard tire equipment.

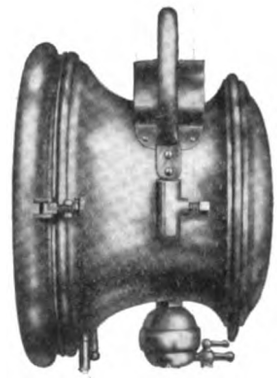
The Actual Safety of Every Motorist

Solar

depends on his lighting equipment when touring at night. It is absolutely necessary that his lamps should be perfect in construction, design, material and workmanship.

SOLAR LAMPS

provide perfect lighting equipment. They throw powerful, penetrating rays over the ENTIRE SURFACE OF THE ROAD. They are absolutely dependable. You can "go as far as you like" with SOLARS. Insist upon getting them with your car—your dealer will see that they are furnished if you gently insist!



Solar Lamps are manufactured in the largest lamp factory in the world by the most skillful workmen available. They are the only perfect automobile lamps made.

KEMPSHALL NON-SKID TIRES
BEST BY EVERY TEST, BECAUSE

1.—They last longest even on heaviest cars; the cheapest tire per non-skid mile on the market, 5,000 to 11,000 miles per tread.
2.—They give perfect immunity from skidding even on the greasiest roads; patented moulded all rubber tread without steel or leather.
3.—They are low pressure tires, minimizing vibration and increasing comfort.
4.—They are freest from punctures and trouble; made from best rubber and fabric, and plenty of them.

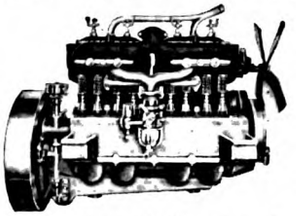
U&H MAGNETOS

Ease of Starting

is not the feature about which the magneto salesman is generally most anxious to talk. He knows that, despite his claims, it takes both knack and elbow grease to start a large engine under any but the most favorable conditions, if reliance is placed on the magneto for the spark.

There is only one exception to this rule. That exception is the

Unterberg & Helmle Self-Starting Magneto
(TYPE LE)



Type LE

This magneto gives its maximum spark on the slowest turn of the crank; and the spark is automatically retarded past the centre, making back kicks impossible.

No batteries are needed with the "U. & H., Type LE"; it is a complete ignition equipment in itself.

STEPNEY
SPARE WHEEL

Every motorist should carry a "Stepney" and avoid all troublesome delays caused by punctures and blowouts. Write for Catalogue D.

The Only Cure for Tire Troubles

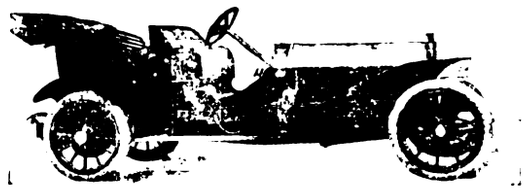
SPARE MOTOR WHEEL OF AMERICA, LTD. 236 Michigan Ave. **CHICAGO, ILL.**

SUPPLEMENTARY SPIRAL SPRINGS

¶ If every driver had to ride in his own tonneau, every car would be quickly equipped with Supplementary Spiral Springs. Owners are not intentionally selfish—many of them just thoughtless. Usually driving or sitting beside the driver, the riding qualities of the tonneau are to them practically unknown.

¶ Not so with the passengers. Rear springs must be strong enough to resist severe shocks under a full load. That means stiff springs under ordinary loads, with the shocks and jars transmitted to the passengers—guests whose comfort ought to be a first consideration.

¶ SUPPLEMENTARY SPIRAL SPRINGS take up all the average bumps and road inequalities and come into real action with the jolts and jars encountered at speed.



¶ With the S. S. S., your springs never whip or touch. They prevent breakage and are the most economical and useful accessory ever provided for a car. Every live dealer carries them and their attachment is a matter of a few hours' time. Do it NOW.

SUPPLEMENTARY SPIRAL SPRING CO.

The Warner Auto-Meter

1909 Style

Guaranteed
Absolutely Accurate

is the only speed indicator made on the Magnetic Induction principle. Because of the principle it accurately indicates every range of speed from zero to the maximum.

All other instruments are made on the centrifugal principle. They fail to indicate any speed whatever under 5 to 10 miles per hour.

The Auto-Meter is so durably made that practical tests have shown that it will endure a **MILLION MILES** of riding without perceptible wear, or departing from absolute accuracy more than **10 feet to the mile.**

We invite comparative tests. Before you decide on any Speed Indicator, put the Auto-Meter on one side of your dash and any other indicator at any price on the other. Then use your watch over a measured course. Keep the instrument which **tells** the **truth.** We know which it will be.

Unless your car has perfect lubrication, your gasoline is used for friction instead of miles of speed. The use of vacuum MOBILOIL saves the wear of your car, the waste of gasoline, and most of the money that goes for repairs.

Vacuum MOBILOIL is made in six different grades to suit the lubrication of every automobile made. One of these grades is exactly adapted to the needs of *your* car. Its use is an investment that saves expense. It will end forever your lubrication troubles, and add to your pleasure and the life of your car.

Write for free booklet showing grade of MOBILOIL adapted to the use of every car. Gives track records to date, and money-saving motor hints.

Vacuum

MOBILOIL

in barrels, and in cans with patent pouring spout is sold by dealers everywhere. Manufactured by

The Fable of Bobby Think-not

LITTLE BOBBY THINK-NOT decided to buy an automobile. He was clever, Bobby was! He investigated — via the advertising. He learned such words as "Magneto," "Honeycomb Radiator," "Offset Cylinder," etc. Then he compared the specifications of various cars and bought the biggest bunch of specifications offered for the money. For the price of a good two-cylinder car he secured a four-cylinder car from a brand new company with a brand new name. The car, so he understood, had bearings like the Mergedes, springs like the Fliat and wheels like a Harrythaw. It would have cost $5,000 had it not been that this company was smarter than any of the old firms in the business, etc.

BOBBY THINK-NOT'S neighbor was a keen business man. He wanted an automobile, too, and he knew nothing about automobiles. He bought a HAYNES on the following reasoning: "That Haynes firm is the oldest in the business. They have survived 16 years — guess they'll last a while longer and back up the performance of my car. They charge a medium price — $3,000. That's above the bargain class and below the damn-the-cost class. The reputation of the car is fine, and reputation is what I rely on. That's the car for me."

Query—Which was best satisfied in the end? Which local agent built up the most substantial local good-will?

"THE SILENT SELDEN"

$2,000 F. O. B. ROCHESTER, N. Y.

AFTER the remarkable results of our "first year"—the achieved success of 1908, we salute you with real and well established confidence as we introduce the Selden of 1909.

Not only has our promise to produce a high grade car of best materials and workmanship for $2000 been strictly fulfilled, but we have demonstrated the Selden genius in a silent, strong, comfortable, durable and handsome car. It does all that the owner wants to do and all that the chaffeur ought to do. Agents and owners are enthusiastic over it. Not a cheap car at all but one of the how-can-you-do-it-for-the-money kind.

Our 1909 wheel base is lengthened 5 inches from 109 to 114; the magneto and pump moved to left side of motor, the remaining equipment on the right; the brakes enlarged and now rigged inside the frame; the wheels now 34 inches were 32 inches; the radiator and hood made to conform in style to longer wheel base—little touches for style and convenience. No radical mechanical changes, simply because we couldn't find any necessary—no use fooling with what has proved so unusually good.

We can assure those who buy the 1909 Seldens all the efficiency of the 1908 Seldens with a little more style and a little more convenience, a little more refinement. The actual records of use and travel this year have so proven their merit, power and economic stability that it would be hard to promise anything better in practical construction.

is the Product of Brains, Capital, Experience and Surpassing Facilities.

Those who are experienced in judging the wheat from the chaff—those who have made many experiments, trials and tests of different makes of ignition apparatus — they are the ones who know and concede the superiority of the SPLITDORF product.

The fact is well worth repeating that the foremost electrical engineer of Europe, M. Pierre de Vasselot, who is familiar with every make of magneto, pronounced the SPLITDORF *unequalled in design and efficiency among magnetos of the present day.*

The SPLITDORF Magneto has the immense advantage of fifty years electrical experience behind it — and experience is a mighty factor in any line.

Into every SPLITDORF Magneto is put as much skill, expert workmanship and choice material as if that instrument was to be the one on which the SPLITDORF reputation rested.

You can equip your car with a SPLITDORF Magneto with perfect assurance of having the most perfect system of ignition that human ingenuity has ever devised.

Let us send you our Magneto Catalog.

Rambler

The Car with the Offset Crank-Shaft.

Model Forty-four, 34 H. P., $2,250.
Spare Wheel, with Inflated Tire, Brackets, and Tools, $74. Magneto, $150.

THE CALL OF THE OPEN ROAD

For the most part we do not travel in our leisure hours to go anywhere, but just to go. The delightful thing is to move; to feel the familiar things slipping away behind us, and to enjoy the open road as it unfolds before us.

We like the stir and speed of the journey, the fresh breeze in our faces, and at the wheel of a Rambler you enjoy the added sense of power and control. Besides, you have a feeling of confidence and satisfaction in driving a car of such unusual quality.

The Rambler Offset Crank-Shaft makes this car silently powerful—capable of running at forty or three miles an hour on high speed, and climbing any hill with gratifying ease.

The Rambler Spare Wheel obviates all tire worries—makes punctures mere incidents of a trip—saves the tiresome task of pumping up the new tire, and can be substituted for regular wheel within three minutes' time.

May we send you the new Rambler catalog or a copy of the Rambler Magazine, a monthly publication for owners? Rambler automobiles, $1,150 to $2,500.

Volume XIX. New York, U. S. A., Thursday, March 11, 1909. No. 24

STEEL TRUST ENTERS THE FIELD

Indications of Its Purpose to Organize Big New Company—Purchase of Belden Patents Included in Plans.

Entrance of the United States Steel Corporation into the field of automobile manufacture, in competition with the established makers, is declared to lie back of the steps which are being taken in Pittsburg, Pa., by men prominent in the corporation for the acquirement of a number of patents governing motor car construction and the organization of a new automobile company. D. M. Clemson, one of the heads of the Carnegie Steel Co., is conducting the negotiation for the steel corporation, and the plan as so far disclosed, provides for the purchase of the patents of E. H. Belden, a Detroit inventor, and for the formation of a concern to be known as the Belden Motor Co.

Arrangements are said to have been made for the erection of a plant at Corapolis, where the steel corporation has set aside about six acres of ground for a factory site. Belden, whose productions have been represented in the automobile industry to some extent in the past, has been in Pittsburg for the last few weeks, giving numerous officials of the subsidiary companies of the steel corporation the opportunity of examining its construction and of having demonstrations.

As an opening wedge into the market, the steel corporation's present program, so far as can be learned, is to have the new company manufacture three models, including touring cars, runabouts and landaus. The runabouts and touring cars are to be of 75 horsepower, while the landaus will be rated at 60 horsepower. On all of the models the minimum price will be $7,500 at the start. After a sufficient manufacturing period to perfect the factory organization for large quantity production and to establish the name of the product in the market, models of popular price will be brought out, and it is intimated that the accompanying campaign for business will be both wide and vigorous.

Norwalk Capital for the Auto-Bug.

Endorsed by the chamber of commerce in Norwalk, O., a special committee of which body has undertaken to place $15,000 worth of its stock, the Auto-Bug Co., purposes to take a factory in that city and commence the manufacture of buggy type motor vehicles, provided the citizens respond properly to the committee's efforts. The concern, of which A. E. Skadden is the head, hails from Newcastle, Pa. In connection with the proposed move to Norwalk, the plans provide for a corporation with an authorized capital of $100,000, to make both buggies and commercial vehicles of low price.

Inter-State a $300,000 Corporation.

Final steps in the incorporation and organization of the Inter-State Automobile Co., of Muncie, Ind., have been taken, the papers filed with the Secretary of State at Indianapolis giving the capital stock as $300,000, of which $200,000 is in common stock and $100,000 in preferred. The following officers have been elected: T. F. Hart, president and general manager; J. M. Maring, vice-president and secretary, and Otto Holden, treasurer.

Minneapolis May Produce the Garicar.

W. M. Pease, of Aberdeen, S. D., is sounding Minneapolis, Minn., with a view to establishing a $100,000 automobile plant in the latter city provided conditions are to his liking. He has let it be known that his product would be called the Garicar, and has enlisted the Commercial Club in his cause.

Witherbee to Move to Springfield.

The Witherbee Igniter Co., of New York City, has leased a factory at Springfield, Mass. Removal to that city will commence next week, the headquarters and general offices of the company accompanying the manufacturing end in the transplantation.

GENERAL MOTORS PLANS UNFOLD

Personnel of the Company—Shares to be $100 Instead of only $1—Glowing Forecast of the Future Earnings.

Still reticent and mysterious, the General Motors Company has at last emerged from the recesses of secrecy to the publication of a prospectus about itself, which has just appeared. The prospectus has for its object the presentation of the company's 7 per cent. cumulative preferred stock—3½ per cent. payable in May and October, respectively—and marks the fact that the enterprise is making its cautious but well marked way toward the point where its shares are to be shoved into the hands of the confiding public. The preliminary steps to this end have already been taken, and a limited list of investing "prospects" have been approached with the offer of "the preferred stock of the General Motors Co. as a conservative and reliable investment." So far has the now completely organized company progressed in its career that it is already advertising a dividend payment to take place on April 1, and amounting to 3½ per cent.—just as promised.

The officers of the company at present, as blazoned to the limelight, are as follows: William M. Eaton, president; William C. Durant, vice-president; Fred L. Smith, vice-president; Curtis R. Hatheway, secretary and treasurer. There is also an executive committee, composed of Durant, chairman, with Smith and Hatheway, while the board of directors, in addition to Eaton, Durant, Smith and Hatheway, has as members, Henry Russell, William J. Mead and Henry Henderson. The registrar of stock is the Trust Co. of America, and the Corporation Trust Co., of New York, acts in the capacity of transfer agent. The office of the company itself is at 103 Park avenue, New York City.

The president, William M. Eaton, although for the purposes of the new ar-

Digitized by Google

rangement he has been made president of both the Buick Motor Co., of Flint, Mich., and the Olds Motor Works, of Lansing, is not widely known to the automobile industry. As the successful promoter of numerous Michigan enterprises, with which his connection in an active sense has been temporary but profitable to himself, he has gained a measure of reputation as a shrewd adept in stock flotation and corporation matters. The early possibility exists, however, that he will before long be replaced in the presidency of the General Motors Co. by one who is more experienced in practical automobile manufacture. William C. Durant, of the Buick Motor Co., is the one with whom the brilliant idea of the General Motors plan is said to have originated and is described, by those who know, as its leading spirit. As one of the officers, and a representative of the principal ownership of the Olds Motor Works, Fred L. Smith has been accorded his place in the executive list, while Curtis R. Hatheway, the secretary and treasurer, is an attorney associated with the New York law firm of Ward, Hayden & Satterlee. By reason of the fact that Herbert L. Satterlee, a partner in the latter firm, is a son-in-law of J. Pierpont Morgan, the famous Morgan banking house has been dragged in by rumor as being back of the project, but its officers have unequivocally denied its connection with it. The names of Henry Russell, William J. Mead and Henry Henderson, of the board of directors, are familiar in Detroit in connection with motor car design and production.

Undertaking the delicate task of properly introducing the stock to the investing and speculative market, W. D. Johnson & Co., of New York, who occupy a modest suite of offices on an upper floor of the Hanover Bank building, the label on the door describing them as bankers, explain in a delicately tinted folder that although the capital stock of the company outstanding on January 1, 1909, was only $7,522,473.89, the assets, exclusive of patents, amount to $8,025,532.51, while with fine dramatic emphasis the statement under the heading of indebtedness is the simple word—"Nothing!"

"The General Motors Company is a holding company, interested in five operating companies," the folder commences, with staccato brevity. Continuing, it sets forth that "These companies are engaged in the manufacture of automobiles and automobile parts. The purposes of the organization are the extension of the industry and the effecting of economies in production and distribution. The policy of the company is dictated by practical and successful men, familiar with automobile construction.

"The product of the constituent companies," it goes on, "is being marketed under a comprehensive system, calculated to insure permanency with reasonable profit under normal trade conditions. The engineering staff of the General Motors Co. is composed of men of recognized ability. The General Motors Co. is represented in almost every city and town throughout the United States.

"The production of the operating companies," it is estimated, "for 1909, will be 22,000 automobiles. The sales for 1909 will approximate $25,000,000. With proposed extensions to present plants, and the new plants to be constructed, the producing capacity in 1910 will be in excess of 40,000 automobiles. The value of the product in 1910 will approximate $45,000,000.

"Among others," the prospectus states, "the General Motors Co. controls the largest automobile plant in the United States. The largest automobile plant in the United States now produces 15,000 automobiles per annum." Inquiry by the Motor World at the Johnson office, develops the fact that this claim as to "the largest plant" refers to the Buick, and not to any other company concerning which similar claims are made.

Suggesting to the mind of the "prospect" the astounding possibilities of the future, a few condensed statistics are given, recording that "In 1906 the total production of automobiles in the United States was less than 20,000. In 1908 (panic year) there were constructed in the United States 68,000 automobiles. In 1908 the invested capital in the industry was in excess of $225,000,000." To banish the last remaining doubt as to the future of the company comes the emphatic but somewhat bromidic pronouncement in large type: "The Automobile Industry is Here to Stay."

A change has been made from the original plan and the shares have a par value of $100 each instead of $1, as was first intended, though the authorized capital remains the same, being $7,000,000 in preferred stock and $5,500,000 in common. The preferred stock, as stated, is a 7 per cent, cumulative issue, with dividends payable April 1 and October 1 of each year. It is only the preferred which at present is offered for outside consumption, in which connection the prospectus declares that "The earnings of the General Motors Co. are sufficient to pay the dividend upon the preferred stock several times over." Application is also to be made for the listing of the company's securities on the New York Stock Exchange as soon as practicable. The "asked" price of the preferred is 98, according to quotations this week.

Efforts of brokers and others to learn what the five companies are in which the General Motors claims an interest bring no satisfactory response from the Johnson office, the magic name "Buick" being tendered as sufficient to satisfy all reasonable demands for the present. Nevertheless, as the Motor World previously has indicated, the new enterprise is known to have control or influence in the destinies of the Olds Motor Works, of Lansing, Mich; the Buick Motor Co., of Flint; the Reliance Motor Car Co., of Owosso; the Weston-Mott axle factory at Flint; and the Imperial Wheel Works, of Flint; not to mention a few minor concerns engaged in mixing varnishes, making tops and the like.

The first two constituted the nucleus, while the Reliance was purchased recently. The Weston-Mott and Imperial Wheel Works properties have for some time been dominated by Buick, in whose service they the chiefly engaged.

A visit to the office of W. D. Johnson & Co. by a representative of the Motor World developed an alarming case of perturbation lest too much information concerning General Motors should be given out. The importance of the "soft pedal" being put on any publicity as to the affairs of the project was emphasized by the manager who would regard it as "a personal favor" if nothing be said.

"What are these companies in which General Motors claims to hold an interest?" he was asked.

"Well, you see," he replied, "we are not just now prepared to give out anything concerning the company. A little later, when our plans have progressed to the proper point, we shall be glad to give full details and to have the papers co-operate with us in presenting things to the public in the right way. But for the present the less said about it the better."

While perfectly ready to laud at length the business acumen and capacity of the officers of the company, nothing could tempt him to make any statement as to the details of the things hinted at in the prospectus.

Reluctant as the promoters of the project would appear about giving out exact and definite information concerning the holdings of the company, there has nevertheless been a very remarkable supply of rumors and newspaper statements of a nature to give the impression that it was buying automobile factories right and left—fairly "gobbling them up" as one Detroit paper had it. To what extent this pains or grieves the astute General Motors strategists is not determinable, but it has brought loud protests from a number of the concerns which are being repeatedly "absorbed" without their knowledge. Among others anxious to set at rest not only past but future erroneous statements of this character, Benjamin Briscoe, president and general manager of the Maxwell-Briscoe Motor Co., in a written statement to the Motor World, says: "We desire to state most emphatically that the Maxwell-Briscoe Motor Co. is not, neither are any of its stockholders or connections, interested in any way in any consolidation scheme whatever. Any rumors that you may hear may be set down by you, therefore, as absolutely incorrect and unauthorized, and we ask that if it is not too much trouble, that you make this statement at any time the occasion seems propitious." Several makers, in fact, have written to deny for all time any relation with the project and to express their annoyance at the unauthorized use of their names.

A. L. A. M. CUTS TWO MELONS

Dividend for Constituent Companies and Rebates for Garden Show Exhibitors—One New Member Admitted.

Not only did the Association of Licensed Automobile Manufacturers admit a new member to its ranks, but at the meeting of the board of managers, on Thursday, 4th inst., a dividend of $50,000 was decided upon for distribution among the concerns composing the association. Furthermore, a rebate of approximately $47,000 to the exhibitors at the last Madison Square Garden show was announced, of which the Motor and Accessory Manufacturers will receive about $23,000, the vehicle exhibitors about $22,300, and the Motorcycle Manufacturers Association $1,700. The dates for the next Garden show were also selected. It will be held January 8 to 15, 1910.

While an "open door" policy as regards new members was announced by the A. L. A. M. some time ago, the path of the Hudson Motor Car Co., of Detroit, Mich., the latest addition to the Licensed ranks, was made especially easy by reason of the fact that it is closely associated with the Chalmers-Detroit Motor Co., through whose selling organization its product will be introduced to the market. It will be conspicuous in the Licensed field because the car which it is to make will be of the low price variety, a four cylinder model selling at less than $1,000. Inasmuch as most of the Licensed makers produce cars selling at considerably above this figure, the new offering will serve to round out the lines available to Licensed agents.

The report of the show committee, through its chairman, Colonel George Pope, pointed out that the large rebate given the exhibitors this year exceeds that of last year by about $15,000, being 40 per cent. greater, and about 100 per cent. greater than was the case in connection with the Garden show in 1907. There also remains in the hands of the committee a large working capital for the next show. A vote of thanks was accorded the committee, the members of which were reappointed to conduct the affair next year. The committee consists of Colonel George Pope, chairman, Charles Clifton and E. P. Chalfant, with M. L. Downs as secretary.

Of the 31 members of the Association 26 were represented, as follows:

George H. Strout, Apperson Bros. Automobile Co.; John S. Clarke, Autocar Co.; W. C. Durant, Buick Motor Co.; W. C. Leland, Cadillac Motor Car Co.; R. D. Chapin, Chalmers-Detroit Motor Co.; M. S. Hart, Corbin Motor Vehicle Corporation; Herbert Lloyd, Electric Vehicle Co.; J. H. Becker, Elmore Mfg. Co.; William E. Metzger, E-M-F. Co.; H. H. Franklin and G. H. Stillwell, H. H. Franklin Mfg. Co.; E. W. Heaington, Haynes Automobile Co.; E. R. Hewitt, Hewitt Motor Co.; S. T. Davis, Jr., Locomobile Co. of America; H. A. Lozier, Lozier Motor Co.; C. W. Matheson, Matheson Motor Car Co.; M. J. Budlong, Packard Motor Car Co.; L. H. Kittridge, Peerless Motor Car Co.; Charles Clifton, Pierce-Arrow Motor Car Co.; A. L. Pope, Pope Mfg. Co.; George Pope, Toledo Motor Co.; George J. Dunham, Royal Tourist Car Co.; G. E. Mitchell, Alden Sampson Mfg. Co.; R. H. Salmons, Selden Motor Vehicle Co.; I. H. Page, Stevens-Duryea Co.; L. J. Hart, Waltham Mfg. Co.; Thos. Henderson, Winton Motor Carriage Co.

Arnstein's Liabilities $283,000.

Investigation reveals that the liabilities of Eugene Arnstein, the Chicago jobber against whom bankruptcy proceedings were brought by Miss Nellie Hanley, his former buyer and manager, reach the surprising total of about $283,000, of which $133,000 is to merchandise creditors, $45,000 owing to banks, $65,000 owing to the relatives of Arnstein, and $40,000 the amount of the Hanley claim. At a meeting of the creditors on the 5th inst., at the Great Northern Hotel, Chicago, a creditors' committee was chosen, with William E. Diehl, Corbin Screw Corporation, chairman, and Messrs. Wainwright, Palmer, Waters and Anderson, representing respectively the Diamond Chain & Mfg. Co., the Continental Rubber Works, the Chicago Handle Bar Co., and Hastings & Anderson.

New Headquarters for A. M. C. M. A.

The American Motor Car Manufacturers Association will this month remove its New York City offices from the Spalding building to a new building which is just being completed at 505 Fifth avenue, a few doors from Forty-second street. Four large rooms have been taken on the fifteenth floor, giving about twice the space that the association has had heretofore. The new assembly room will be especially spacious, providing accommodation for large gatherings.

M. A. M. Moves to New York.

Removal of the official headquarters of the Motor and Accessory Manufacturers will take place March 15, from the present location in the Union building, Newark, N. J., to New York City. Suitable offices have been engaged in the Argus building, 17 West Forty-second street, where the regular business of the association will be conducted and where the meetings of the board of directors will be held.

Reliable Dayton Makes Capital $200,000.

Increased capitalization has been provided for the Reliable Dayton Motor Car Co., of Chicago, Ill., manufacturers of carriage type motor cars and delivery wagons. From $25,000 the expansion has been made to $200,000, all paid in. In its three years of business life the concern has greatly outgrown its original capital.

N. A. A. M. APPOINTS COMMITTEES

Recommends Starting the Glidden Tour from Detroit—Votes to Oppose Closing Mt. Desert to Automobiles.

Indicating an intimate touch with the course of automobile affairs in general, the executive committee of the National Association of Automobile Manufacturers, at its meeting on Wednesday, 3d inst., in addition to transacting business relating to its own organization affairs, such as the Chicago show report, the election of a new member to the committee, and the appointment of sub-committees for the ensuing year, adopted resolutions relating to the proposed prohibition of automobiles in Mt. Desert, Me., and to the naming of Detroit as the proper place from which to start the Glidden tour.

To succeed William Mitchell Lewis, resigned, J. W. Gilson, of the Mitchell Motor Car Co., of Racine, Wis., was chosen as a member of the executive committee. For the first time since his election as president, S. D. Waldon occupied the chair. The report of the general manager indicated that the late Chicago show had been the most successful that the association had ever held, both in the amount of business transacted and in the net receipts.

The resolution that was adopted concerning the American Automobile Association's tour set forth the fact that Detroit had become the greatest automobile manufacturing center of the world, it being estimated that the value of the motor car products of that city for the year 1909 will be approximately $50,000,000. The N. A. A. M. believes "it would be a proper and fitting tribute to the enthusiasm displayed by the motorists of Detroit" to make it the starting point for the tour.

Considerable attention was devoted to the Mt. Desert situation, it being shown that the petition for the prohibition of motor cars on the island had been signed by 61 persons, practically all of whom were summer residents, and, further, that they had raised a "lobby fund" for the promotion of the prohibitive legislation. Counsel for the N. A. A. M. has been instructed to use all the means in his power to prevent the passage of such a law.

The president nominated and the meeting approved the following committee appointments for the year: Membership, S. T. Davis, Jr., Benjamin Briscoe and C. C. Hildebrand; legislative, W. R. Innis, R. D. Chapin and C. G. Stoddard; roads, R. D. Chapin, S. T. Davis, Jr., and L. H. Kittridge; show, W. E. Metzger, A. L. Pope and Thomas Henderson; contest, H. O. Smith, W. T. White and W. E. Metzger; audit, Benjamin Briscoe, S. T. Davis, Jr., and Charles Clifton; traffic, A. L. Pope, W. R. Innis and C. C. Hildebrand.

In the Retail World.

A. B. Ward has opened a garage and repair shop at Fresno, Cal. It is located at 1228 I street.

J. W. Mears, of Brooklyn, N. Y., has opened a salesroom at 136 Livingston street. He will represent the Acme.

J. H. MacAlman has taken the agency for the Stearns in Boston, Mass. His headquarters are at 889 Boylston street.

The Auto Specialty Co. plans to open in Kansas City, Mo., this month. It has taken a location at 308 East Fifteenth street.

Jerry Ward, of Missouri Valley, Ia., has opened an automobile repair shop. A very complete equipment has been installed.

S. A. Houser has instituted an automobile livery service in Omaha, Neb. It operates day and night from the New Schlitz Hotel.

Thomas Trewet, of Anderson, Ia., has opened a repair shop for automobiles. He is one of the pioneers in this line in his vicinity.

Frank A. Zabel has become established in the automobile business in Johnson, Nemaha county, Neb. He is agent for the International.

W. S. Guthrie's garage, at Terrell, Tex., was burned out on the 17th ult. The loss was $2,750, and the cause of the fire not accounted for.

Charles L. Blatz had an "opening day" for his new Market street garage, on the 1st inst., at Sandusky, O. He holds the Maxwell agency.

John Hilliard has commenced the erection of a garage in Ottawa, Ill. It is located on Main street, between the A. Mutter and the Formhal buildings.

The Palmer-Singer Distributing Co., with L. A. Hillman as manager, has entered the trade in St. Louis, Mo. It will represent both the P. & S. line and the Simplex.

G. F. Stark and R. F. Baker have organized the firm of Stark & Baker and have opened at 972-6 North High street, Columbus, O. They will handle the Maxwell.

Maine has been invaded by the Black Mfg. Co., of Chicago, Ill., makers of motor buggies. The company has opened an office and salesroom in Portland, at 220 Commercial street.

W. H. Brewer, Raleigh, N. C., has formed the Carolina Garage & Machine Co., which is erecting a two story building. The entire lower floor will be used as a salesroom for Franklin cars.

The Foss-Hughes Motor Car Co. has taken a location for a branch in Baltimore, Md., where the Pierce Arrow wil be featured. The branch will be at 533 North Howard street.

The Mahlke Automobile Garage, of Wheeling, W. Va., has been sold by R. H. Mahlke to a stock company. The name will probably be changed to the West Virginia Automobile Co.

The Pence Auotmobile Co. has expanded so that it now takes in St. Paul as well as Minneapolis, Minn. The St. Paul branch is as 208 West Fifth street, and will be in charge of J. B. Farr.

The latest addition to Boston's automobile colony is the American Simplex Co. of Boston, which will handle the American Simplex 2-cycle car. W. Mason Turner will have charge of the new agency.

The J. W. Bowman Co., of Boston, Mass., is again in its old quarters at 911 Boylston street, from which it was compelled to move by the fire of January 26. The place has been fitted up more elaborately than before.

W. S. Lininger, 203 East Eleventh street, Columbus, Neb., has outgrown his present quarters and has accepted plans for a new building. It will provide increased garage and repair shop space, as well as a large salesroom.

The Woonsocket Automobile Co., of Woonsocket, R. I., has commenced a sales, garage and repair business at 117 Berman street. The proprietors are Frank Bigbie and Porter Turner, and the Regal car will be the leader.

J. Hollingsworth, proprietor of the Overlang Garage at Ogallala, Neb., has arranged to handle the Overland car in Keith, Perkins and surrounding counties. A first class repair shop is operated in connection with the garage.

Charles Hagman, formerly of Hagman & Hammerly, has taken the Chicago agency for the Lambert friction drive cars. He is building a garage and salesroom at Hoyne avenue and Jackson boulevard.

Alfred W. Peard, of Hartford, Conn., is agent for the Overland car, not the Oakland. He is the Overland selling agent not only for Hartford, but for the surrounding territory and has established a salesroom at 26 Kingsley street.

W. C. Marsh and Lyle Selby have become agents for the Studebaker and E-M-F. cars at Adair, Guthrie county, Ia. They are remodeling one of their implement houses at Audubin and Cass streets as a salesroom, garage and repair shop.

The Holmes-Adkins Co., which conducts a general transfer business in Omaha and South Omaha, Neb., is building a garage and automobile machine shop in the latter place. The company has the agency for Jackson and International cars.

Morgan & Wright have effected the transfer of the location of their New York City branch. From 214 West Forty-seventh street the move has been made to commodious quarters at 1849 Broadway, where all styles of Morgan & Wright tires will be carried in stock.

Fire played havoc with the Sanger Automobile Co.'s garage, 572-4 Farwell avenue, Milwaukee, Wis., on the 21st ult., destroying 24 machines. The loss, chiefly on the contents, is estimated at $70,000, partly covered by insurance. The origin of the conflagration is unknown.

The Chicago Motor Car Co., agent for the Packard, will build a new establishment at the northeast corner of Michigan avenue and Twenty-fourth street, in the Windy City. It will be a three story L-shaped building of concrete and brick, and will be completed next August.

The Bischeld Auto Co., 214-16 East Second street, Grand Island, Neb., is operating a garage and repair shop in connection with its automobile salesroom. Oscar Kirschke, of the company's sales force, has returned from the Omaha show with a number of new equipment ideas which will be incorporated in the service.

Fred T. Smith, agent for the Apperson and the Autocar in Boston, Mass., who lost his shop location as a result of the Park square fire, has secured new quarters. He has taken a large portion of the big manufacturing building located at 61-63 Wareham street, obtaining a transfer of the lease from the Locomobile Company of America.

Gawthrop & Wister, agents for the Elmore in Philadelphia, have branched out into larger quarters by the acquisition of a garage building at 223-5 North Sixteenth street. They have also established a separate agency sales office for the Elmore at Filbert and Juniper streets, in charge of W. W. Gawthrop. The local retailing will be at the old place, 244 North Broad street.

The Week's Incorporations.

Cleveland, O.—Auto Sales Co., The, under Ohio laws, with $5,000 capital. Corporators—R. W. Edwards, et al.

Council Bluffs, Ia.—Atlantic Automobile Co., under Iowa laws, with $25,000 capital. Corporators—C. L. Herring, J. G. Herring and B. A. Spinney.

Muncie, Ind.—Inter-State Automobile Co., under Indiana laws, with $300,000 capital. Corporators—T. F. Hart, J. M. Maring and Otto Holden.

Saginaw, Mich.—Erd Motor Co., The, under Michigan laws, with $22,900 capital. Corporators—John G. Erd, Harry S. Erd and William J. Passolt.

San Antonio, Tex.—Lemly-Wood-Brownlee Auto Co., under Texas laws, with $15,000 capital. Corporators—F. H. Lemly, J. R. Wood and J. A. Brownlee.

Kansas City, Mo.—Zartman-Tuller Motor Car Co., under Missouri laws, with $2,500 capital. Corporators—A Zartman, B. H. Tuller, F. M. Hayward, et al.

St. Louis, Mo.—Phillips Automobile Co., The, under Missouri laws, with $2,000 capital; to deal in automobile supplies. Corporators—Henry Ascher, A. W. Alexander and J. W. Taylor.

Buffalo, N. Y.—Henry Brunn Automobile Co., under New York laws, with $20,000 capital; to manufacture motor vehicles. Corporators—Henry Brunn, Anthony Sturtzer and George Ostendorf.

JANUARY SHOWS A BIG DECLINE

Shrinkage Greater in Value Than in Volume of Exports—Remarkable Falling Off in United Kingdom's Buying.

Increases in the exportation of American cars to foreign countries during January were recorded in six of the fourteen geographical divisions into which this trade is classified, the list of those who have become larger customers than before including British North America, Mexico, "Other Europe," West Indies and Bermuda, British Australasia and Africa. The gains made in these divisions, however, are offset chiefly by a very remarkable falling off in the exportations to the United Kingdom, which has heretofore been the heaviest buyer on the list, but which during the month took $45,785 as against $194,805 during the corresponding month last year. As a customer, therefore, it gives first place for the month to British North America, whose purchases were $53,271 as against $19,064 in the previous January. Declines in France, Germany and Italy are shown, though of a far less serious nature than in the case of the United Kingdom, while a lessening in trade is evident in the relations with South America, British East Indies, Other Asia and Oceania, and Other Countries. The total of cars and parts for the month was $292,995 as against $405,652 in the same month a year ago, although in the actual number of cars shipped abroad the difference is only that between 180 and 167 machines, respectively. This disproportion is due to the fact that while the average value per car of the machines shipped during January, 1908, was $2,504.52, the average for the same month in 1909 was $1,427.88.

For the seven months ending with January, the number of cars shipped amounted to 1,041, having a value of $1,950,143, which with $321,406 in parts, makes a total of $2,271,549. This is somewhat less than the record for the same period in 1908 and 1907, both as to the number of cars shipped and the value of the exportations. The record in detail is as follows:

	January		Seven Months Ending January		
	1908	1909	1907	1908	1909
Automobiles	$369,075	$238,456	$2,103,550	$2,391,460	$1,950,143
Parts of	36,577	54,539	325,993	321,999	321,406
Exported to—					
United Kingdom	194,805	45,785	562,958	899,249	682,324
France	39,015	33,084	177,663	274,224	136,377
Germany	2,616	210	67,671	80,743	58,402
Italy	15,231	10,784	68,825	43,452	40,167
Other Europe	6,353	13,916	87,761	83,322	121,089
British North America	19,064	53,271	496,094	469,541	667,902
Mexico	47,597	49,183	465,073	273,906	186,478
West Indies and Bermuda	31,956	48,549	100,043	182,519	146,989
South America	21,551	11,254	131,381	169,348	64,692
British East Indies	1,910	1,736	21,142	19,357	14,784
British Australasia	14,668	14,712	169,577	137,018	68,883
Other Asia and Oceania	8,051	5,707	66,666	66,963	58,649
Africa	697	2,822	7,402	6,600	16,389
Other countries	2,138	1,982	7,287	7,217	8,424
Total	$405,652	$292,995	$2,429,543	$2,713,459	$2,271,549

Claims Patent Rights on Shaft Drive.

Homer L. Boyle, whose patent claims were reviewed in the Motor World in August, 1907, in connection with his contention that he had basic rights covering shaft drive construction on automobiles, has renewed his agitation after a period of inactivity and has instituted suit against a well known manufacturer. He is the author of the "History of Peace" and has a plan for insuring permanent peace among the nations, but in questions involving his supposed patent rights he is not averse to legal warfare. He was formerly of Grand Rapids, Mich., but now resides in Lansing. The patent on which he seeks to collect tribute is No. 470,175, and is dated March 8, 1892.

Auto-Car Equipment Reorganizes.

The Auto-Car Equipment Co., of Buffalo, N. Y., has been reorganized as the Auto-Car Mfg. Co., with a capital of $500,000. While in the past it has made a leader of electric trucks, considerable attention will be given to gasolene commercial vehicles in the future.

Changes in Ajax-Grieb Staff.

J. B. Burwell, former Chicago manager of the Ajax-Grieb Rubber Co., has been placed in charge of the Minneapolis branch. C. R. Van Auken has been made manager of the Detroit branch, succeeding Charles W. Hatch.

Firestone on West Indian Outing.

H. S. Firestone, president of the Firestone Tire and Rubber Co., Akron, O., has started on a five weeks business and pleasure trip to Havana and other southern points. He will include the Bahama Islands on his itinerary.

Making Empire Tire Plant Bigger.

The Empire Automobile Tire Co., Trenton, N. J., is erecting another large addition to its plant. It is a duplication of the building put up last spring.

Reorganized Rainier Incorporates.

The reorganized Rainier interests have incorporated as the Rainier Motor Co. of New York. The capital is $350,000.

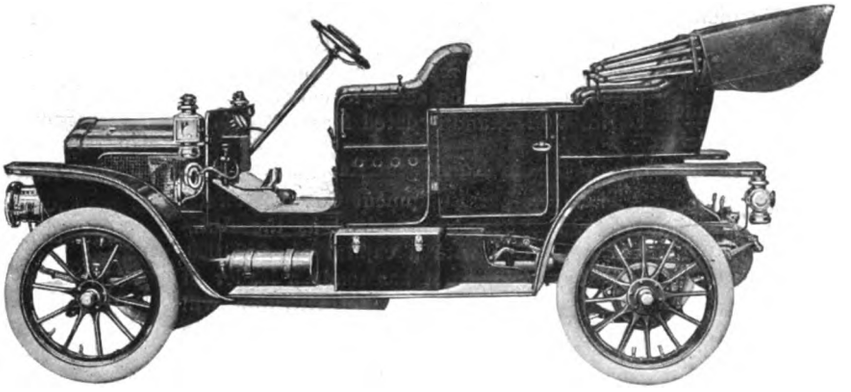
AMERICAN NAPIER INCORPORATES

New $1,000,000 Corporation to Rehabilitate the Old Company's Business—Plans for Immediate Renewal of Activity.

After something like two years of quiescence following the failure of the Napier Motor Co. of America, the interests formerly concerned in the reproduction in this country of the English Napier car are preparing to recommence activities. Accordingly the American Napier Co. was incorporated last week under the laws of Maine, with a capitalization of $1,000,000. Otto B. Cole, who for some time has been associated with American Napier affairs, is named as president, and it is understood that the organization will be continued in much the same form as before.

After the failure of the old $600,000 company in 1907 it was bought in by a few of the stockholders and the business continued on a limited scale at the Jamaica Plains factory, which was formerly a part of the old plant of the B. F. Sturtevant Co. A few cars have been built, but the bulk of the work has been in effecting repairs and replacements to cars already out.

A new contract has just been closed with the parent English concern, which stipulates the retention of John S. Napier of that concern as consulting engineer. Parts in the rough and materials will be imported for the most part, to be finished and assembled in this country. American parts also will be utilized to a certain extent. The product will comprise a line of three cars, one of which, the 40 horsepower, four cylinder model, is on view this week at the Boston show. In addition to this there will be two six cylinder machines, one of 30 and the other of 60 horsepower; while a limited number of the smaller four cylinder cars also will be marketed.



During the current year about 200 cars will be built, in which connection the capacity of the present plant will be increased by about one-third by the addition of something like an acre of floor space. For 1910 it is planned to undertake production on a much larger scale. Plans are also said to be on foot to manufacture some of the Napier models with the compressed air system of transmission which is being offered by the Compressed Air Power Co., Boston, of which the treasurer is one of the incorporators of the new Napier company.

Logan Creditors Defer Selling Plant.

Creditors of the Logan Construction Co., Chillicothe, O., met on the 8th inst., to consider an offer for the purchase of the entire plant for a little over $16,000. As this is only about 50 per cent. of the appraised value there was considerable objection and the matter was adjourned until March 19.

The Advantages of the
WHITE STEAM CAR

The White Steamer possesses so many points of superiority over other types of automobiles that any one who purchases a car without first investigating the White is acting with only a partial understanding of the present-day attainments in the construction of automobiles. The principal advantages of the White may be summarized as follows:

All variations of speed are obtained without the shifting of gears.
The speed of the car responds instantly to the throttle.
It is free from vibration.
It is noiseless.
It is smokeless and odorless.
The engine can never be "stalled."
It starts from the seat—no "cranking."
It is easiest on tires.
The power is transmitted without the use of a friction clutch.
It is unequaled for hill-climbing.
It is the simplest car to operate.
It is the safest for the passengers as well as for the other users of the highway.

We can meet the requirements of almost every pocketbook with either our 20 horse-power car at $2,000 (shown above) or our 40 horse-power car at $4,000.

Preparing Emergency Markets.

In moments of confidence, business men of large enterprise have revealed the fact that during prosperous times they have borrowed money from as many banks as possible, to familiarize those institutions with their paper, so that when hard times might come more channels of bank accommodation would be open to them than if previously they never had sought loans. A parallel to this policy is suggested in the attitude taken by at least a few motor car manufacturers in spending money for the development of export trade when the latter is not necessary to their present success.

"This country is plenty big enough for us" is the more usual sentiment, however, even among some of the largest makers, and, viewing the space from the Atlantic to the Pacific and from the Canadian border to the southern outposts, it does appear to provide all the necessary size and opportunity for trade endeavor. Owing to its great size and the variety of its interests and industries in its different sections, an excellent balance is maintained between its areas of prosperity and depression, respectively, as was evidenced during the so-called panic period, when the slackening of the automobile market which took place in certain large districts was quite offset, from a general standpoint, by the remarkable activity in others.

In recognizing or asserting the advantages that this width of market affords, the same considerations point even more strongly to the benefits derivable from a trade that rests on a basis not confined to the American circumference. Big as is the territory within the United States, in square miles, population and market possibilities, it is still subject to those large and sweeping variations in business conditions which affect it as a whole, in spite of the happy way in which the automobile trade came through the last unpleasant flurry.

Bobbing up serenely with a "Never-touched-me!" expression, the industry has busied itself planning enormous future production, a factor in the situation which every maker, no matter how securely placed his immediate output may be, will have good reason to recognize. If the unpleasant point of overproduction is reached as early as many indications would promise, the makers with a purely domestic market will not rest as easy in the circumstances as those who have prepared other outlets for their manufactured stock.

With whatever vigor the work is carried on, the introduction of any particular maker's cars into the foreign markets is a slow and tedious process, so that in business extremity a sudden turn toward lands across the sea will not yield the desired results, no matter how intense is the effort applied. The deliberate machinery of foreign trade cannot be put into motion for a newcomer with the rapidity that his need demands. Neither is it reasonable to suppose that retail buyers abroad will take warmly to a car or maker that to them has heretofore been unknown. Where a maker has already broken the way for his product, however, and has established his reputation and connections, he can, when emergency dictates, jam on the pressure with a fair certainty of corresponding orders.

Garbling American News.

Instead of relating how a Chicago pork packer ordered 85 automobiles regardless of price, so that he could always have one in service, or how western cowboys pitted a wild bull against a mine owner's touring car in a fight for $11,000,000 a side, the European publications are now devoting more serious attention to American automobile matters, and the English papers particularly are observed to have many excellent and accurate accounts of motoring events and progress in the United States. Nevertheless, the British editorial attempts to enlighten readers as to American happenings are frequently startling, as witness the following extracts from an account in London Motor, concerning Boston's conflagration in January.

"A cablegram from Boston (U. S. A.)," the paper declares, "records a great disaster to the American automobile industry. Whilst a fierce blizzard was raging on Sunday morning, a fire broke out in the Coliseum, the largest building in the city, in which was being held the annual motor show. In the course of a few hours the building and all its contents were entirely destroyed. The exhibits were those which 10 days prior had constituted the bulk of the cars displayed at the Madison Square Garden, New York, for the annual show of the American Motor Car Manufacturers Association, having been transferred to Boston from whence they would later have been sent to the Chicago show.," etc.

Those familiar with trade matters will relish the humor of so complete a garbling since the only "Coliseum" of large importance to the automobile trade is the one in Chicago, and the Boston automobile show is holding forth during the present week. That the American Motor Car Manufacturers Association should have been represented in the Madison Square Garden instead of the Grand Central Palace is news which escaped even the most observant, and will no doubt astonish the Association of Licensed Automobile Manufacturers who up to this time have congratulated themselves on controlling the Garden for their own exhibits exclusively. Explanatory amplification on meagre reports apparently involves a task that is still too much for the British editor, until he has had further time to acquaint himself with American affairs.

"Senator Frelinghuysen believes that non-residents should contribute their share toward keeping New Jersey's roads in repair." So states a New Jersey paper. The Senator is, of course, entitled to his own opinions,

Digitized by Google

and no particular fault can be found with him for holding a belief that is the quintescence of provincialism. But when the paper in question goes on to say that this arch enemy of the automobile is "an enthusiastic automobilist and an advocate of sane motoring,"we experience a feeling of nausea. —Exchange. Tut! tut! For that tired feeling try peruna. Frelinghuysen is one of the sanest motorists that ever made laws for New Jersey. He proves his sanity by voting in New Jersey and living in New York, and the illustrious carpet bagger so enthusiastically believes in paying for the upkeep of roads that it is rumored that in the occasional role of a New Yorker he has tendered New York State $1,500 in payment for the damage his car has done to its roads during the several years he has used them.

From the heyday of the bicycle industry the British automobile trade has inherited to some extent a predeliction for the "nameless" or "transfer" product, which is to say, the partially or completely assembled machine which is bought by a dealer and sold as of his own production. Up to this time, the practice, with its questionable effect on the market has not been in evidence in this country, but that its appearance here is threatened is revealed by an English motor trades publication which announces the receipt of a letter of inquiry from America asking for the names of firms willing to supply cars of the nameless variety. Any product produced on such a basis is apt to go down into oblivion as nameless as it appeared, and the industry is too well established to be in any sort of danger from such practices. Nevertheless, the development is an interesting one as indicating a digging up of old schemes.

Although as a pirate Automobile Topics is not comparable with the Motor re-Print, our more respectable contemporary will do well to be cautious in crediting borrowed matter to manufacturers house organs. Not all of the latter always give credit where credit is due as the reproduction in Topics of a Motor World editorial, credited to a house organ, serves to demonstrate.

Women drivers are to be barred from the Glidden tour by the A. A. A., to meet the wishes of the manufacturers contest committee. The latter should now prod the A. A. A. into similar action as to allowing the participation of women in track contests.

IN THE REALM OF CAB AND 'BUS

Motor Vehicles Replace Washington's Herdics—Taximeter Service Spreading—New Companies Formed.

Pursuant to an act of Congress, the Metropolitan Coach Co., of Washington has put into service in Sixteenth street a motor omnibus which is the first to be installed in place of the old-time herdics which have been so great a source of annoyance to Washingtonians for many years. The new 'bus is unique in that it is air-cooled, and also in possessing worm drive and a number of other features peculiar to the construction adopted by the H. H. Franklin Mfg. Co. It is, in fact, an adaptation of an 18 horsepower Franklin truck chassis, carrying a sixteen passenger body with side seats and rear door. The vehicle is designed for one-man operation, the door being controlled by a strap from the driver's seat, while the fares are deposited in a special collection box of which the driver is in charge. The machine is geared to a speed of about 15 miles an hour, and has a three-speed sliding gearset. It is scheduled for a daily service schedule of 17½ hours, during which time it will cover 120 miles.

Beating the taximeters has become a custom on the part of London motor cab drivers where the patron does not look like a "spotter" and where the route to be taken is not likely to disclose to the company officials the offense of running with the "For hire" flag up. "Shall we use the taxi, sir, or shall I leave it to you?" is the polite inquiry on the driver's part. If the register is considered unnecessary, both driver and passenger gain accordingly, while the company bewails its dwindling profits.

William Rudd, formerly with the New York Taxicab Co., has organized a company of his own in Brooklyn, N. Y., which will be known as the Brooklyn Taxi-Cab Co. It is capitalized at $250,000, and the plans provide for an equipment of 125 machines by the first of May. The officers chosen are; William Rudd, president; Franklyn Kelly, vice-president; William A. Abel, treasurer; Vincent W. Many, secretary.

John W. Wibley has been elected president of the Pittsburg Taxicab Co., which is expecting to put about 25 machines in operation within a few weeks. The other officers chosen are: Grant McCargo, vice-president; C. A. Blanchard, treasurer, and W. Sable Lynn, secretary.

Second to enter the taximeter cab field in Denver, Colo., a new company has been organized by Henry Hurlburt and Ralph Glover. It will be known as the G. H. Garage and Taxicab Co., and will have its headquarters at Seventeenth and Pearl streets.

American and Canadian capitalists have formed a taximeter cab company at Toronto, to be known as the Berna Motors and Taxicabs, Ltd. The concern is capitalized at $500,000, and it is proposed to employ cars of French manufacture.

COMING EVENTS

March 6-13, Boston, Mass.—Boston Automobile Dealers Association (Inc.) seventh annual show, Mechanics Building.

March 8-13, Kansas City, Mo.—Kansas City Automobile Dealers Association's show, Convention Hall.

March 8-13, Portland, Ore.—Portland Automobile Club's show.

March 8-13, Memphis, Tenn.—Automobile show, Auditorium Building.

March 11, New York City—Midwinter endurance run, New York to Boston, for Campbell trophy.

March 11, 12, 13, Milwaukee, Wis.—Milwaukee Automobile Club's first annual show in the Hippodrome.

March 13-20, Minneapolis, Minn.—Minneapolis Automobile Show Association's show, National Guard Armory.

March 15-20, Rochester, N. Y.—Rochester Automobile Dealers Association's show, Convention Hall.

March 16, 17, 18, Chattanooga, Tenn.—Three days race meet and hill climb on Lookout Mountain.

March 17, 18, 19, Pittsburg, Pa.—Three days' endurance run.

March 22-27, Toledo, O.—Toledo Automobile Dealers Association's automobile show.

March 23-26, Daytona, Fla.—The Motor Contest Association's (Inc.) seventh annual international races, Daytona Beach.

March 24-27, Syracuse, N. Y.—Syracuse Automobile Dealers Association's first annual show, New York State armory.

March 25, 26, 27, Logansport, Ind.—Automobile show, old rink.

March 27, Atlanta, Ga.—Third annual hill climb, on Stewart avenue hill.

March 27-April 3, Pittsburg, Pa.—Automobile Dealers Association's show, Duquesne Garden.

April 5-10, New York City—New York Automobile Trade Association's second annual automobile carnival.

April 10, New York City—New York Automobile Trade Association's second semi-annual hill climb on Fort George hill.

April 15-17, Louisville, Ky.—Louisville Automobile Association's show, Coliseum.

May 3-6, Harrisburg, Pa.—Harrisburg Motor Club's endurance run.

May 18, 19, Norristown, Pa.—Norristown Automobile Club's endurance run, to Hagerstown, Md., and return.

May 22, Hartford, Conn.—Automobile Club of Hartford's 200 miles endurance run.

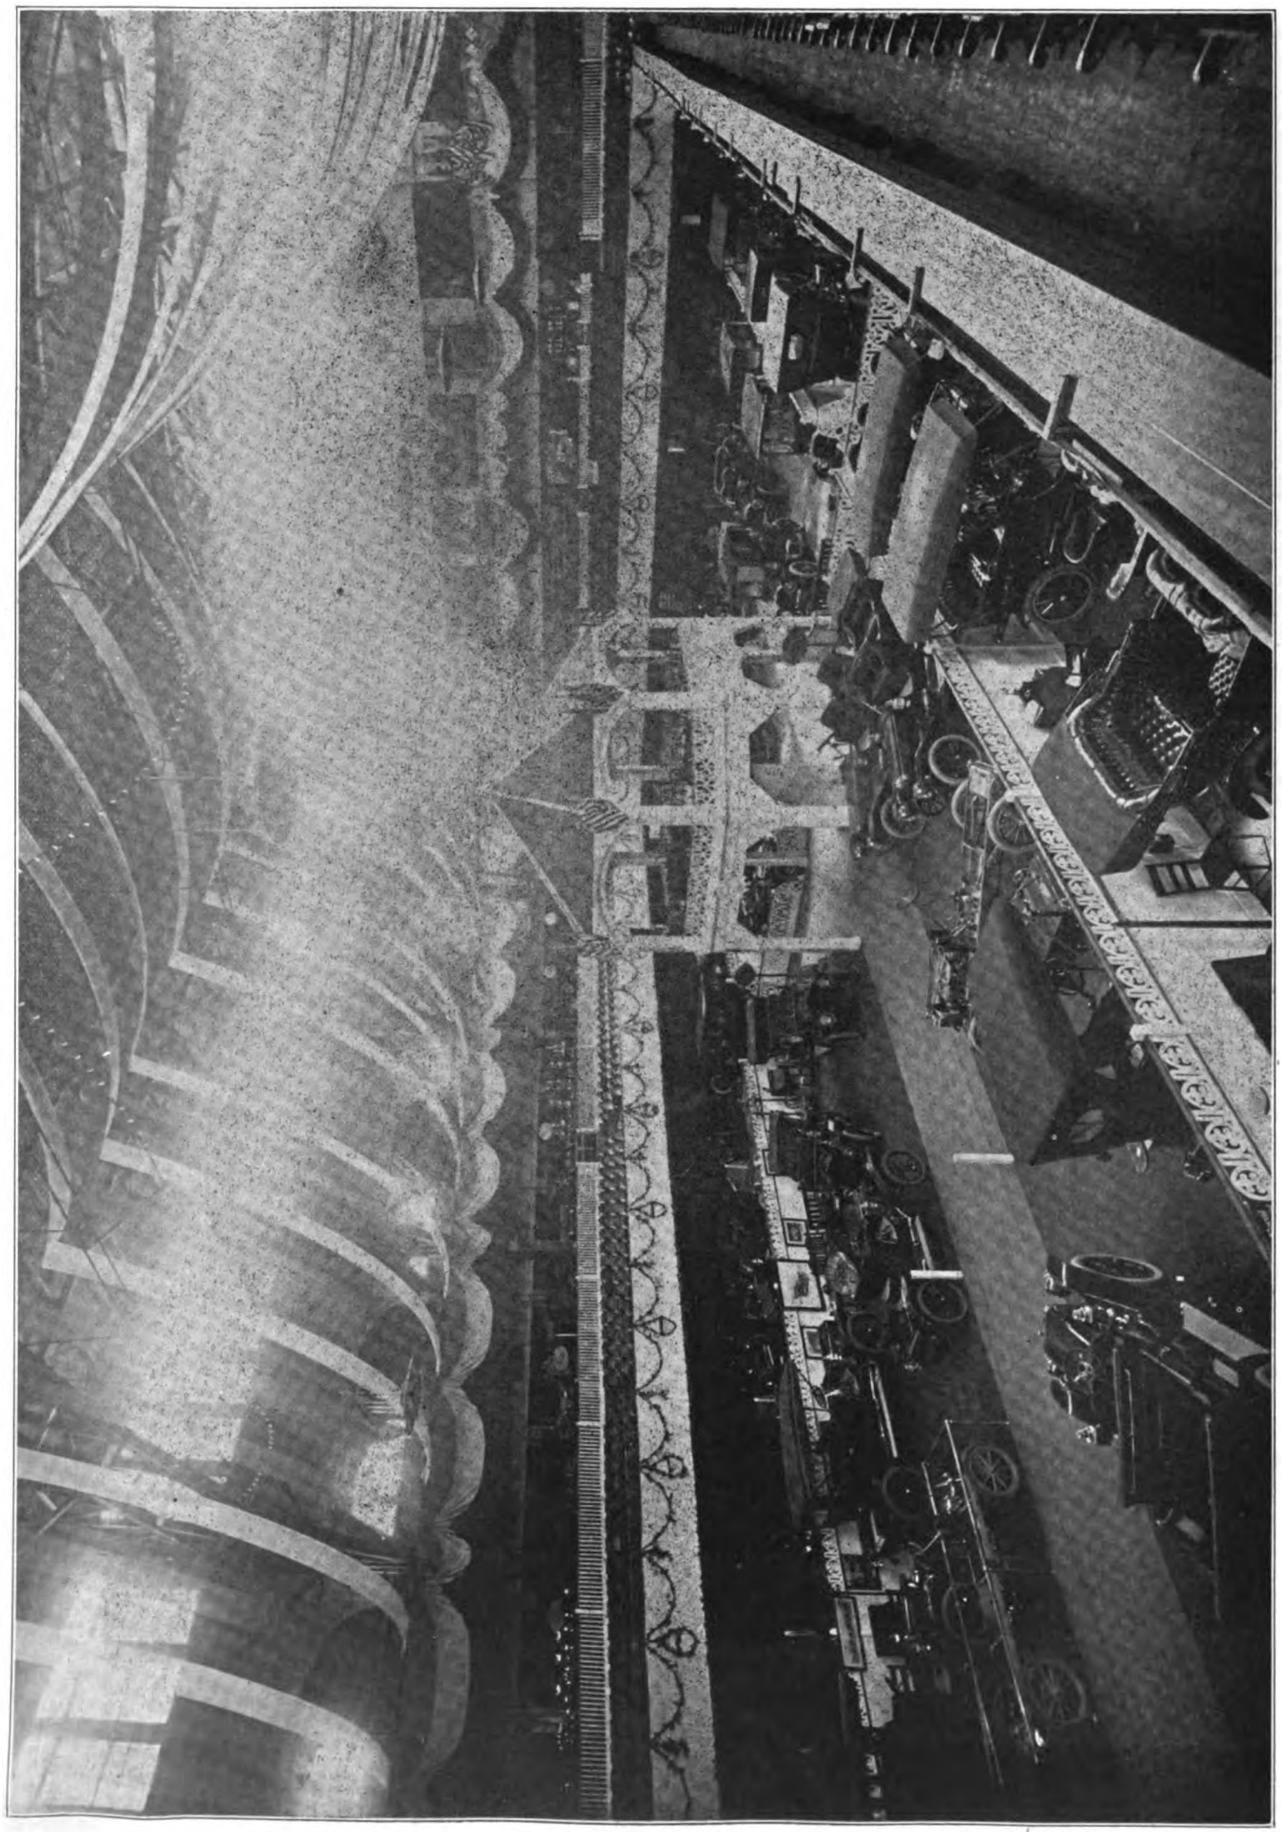
BOSTON SHOW THE HUB'S BIGGEST AND BEST

PAGES POSING AT ENTRANCE TO BOSTON SHOW

Exceeding all preconceived notions of a local show, revealing a greater number of cars than either of the two New York shows of this season, and bigger than any exhibition of its kind ever held in New Eigland, the seventh annual show of the Boston Automobile Dealers Association, which is stuffed into every corner of Mechanics Hall this week, well may be considered one of the most notable events of the year. That conservative old New England should afford sufficient encouragement to the motor vehicle to warrant such a demonstration is hardly less remarkable than that the industry should be able to afford such a variety of products in the double ranges of price and size.



In proof of the sheer bulk of the show, witness the fact that it reveals one-third more cars than were shown at the corresponding time a year ago, that there are within half a hundred of as many cars on view as were shown at Chicago last month, and that it stages within one hundred of as many cars as were shown at both of the recent New York shows put together. As a matter of fact, 409 distinct and separate vehicles are displayed, this number representing the product of more than 100 different makers, and the presentation of just 90 exhibitors. Of parts, accessories and equipments, there are 150 displays. In addition to these, there are, as a matter of course, sundry other exhibitors, whom a generous management admits out of deference to Boston's long-established custom of maintaining a welcoming latch-string on the exhibitor's entrance to Mechanics Hall But it should be added that there is less of this outside element in evidence than usually has been the case before, so that in every respect the show is a record-breaker.

For its success, much credit is due to the activities of the show committee of the dealers' association, and especially to manager Chester I. Campbell, who is both a tireless and purposeful worker. Indeed, the management of the show is peculiar in its intimacy and man-to-man quality. So strong is this quality that no surprise is excited if, previous to the opening of the show, the manager himself is discovered in long linen duster not merely superintending the work of the decorators, but, actually plunging into it with an air of apparent determination to do it all himself; or if after it is in full sway, he is to be found, not entertaining visitors in his office, but out in the show, giving personal instructions to some workman or attendant.

The eye of the continuous pursuer of the various shows refuses to be over-awed with any save the most daring of color schemes and the most ornate of embellishments. Yet it must be admitted that the scheme of decoration adopted for this year's show is harmonious and pleasing, if lacking somewhat of the dash of last year's "Japanned" setting, or the daintiness of the apple blossom era of the year before. White, set off with green, backed by saffrons or dull reds and topped with yellow, is the coloring, and besides being restful to the eye and delightfully free from the affected classic in decoration, it furnishes a soothing background against which the cars show to good advantage, even when they happen to be as offensive as garish coloring can make them.

As the "Hall of Arches," that portion of the big exposition building generally known as Exhibition Hall, is first to meet the eye of the average visitor. Here the pillars are concealed beneath a mask which gives them the semblance of onyx columns supporting arches of white marble which join to divide the ceiling into rectangles where from the central arc lights, rays of yellow and white extend to the sides. Decorations in high relief on the arches break up their monotony, while rows of electric lights serve to lighten them as well as adding to the illumination which is mainly supplied by

Digitized by Google

VISTA OF THE HALL OF ARCHES, BOSTON SHOW

the lights in the center of the ceiling panels. Separating the exhibits are barriers, breast high, solid white below, but latticed at the top and surmounted by green railings. At the corner of each stand an oval sign with golden letters on an onyx background and mounted on a wrought iron standard, serves to indicate the nature of the exhibit. The arches are of cheese-cloth, the onyx pillars are thinly coated with marbled paper, and the open grillings on the fences which separate the booths are papier-mache. Nevertheless, the effect is the same as though the materials were real instead of counterfeit, and the attention is in no way distracted by them from the objects for which they are meant to serve as a setting.

In Grand Hall, a slight variation has been made necessary by purely architectural considerations. The bandstand this year occupies a preferred position in the very center of the hall, where it takes the form of an octagonal pagoda, surmounted with a red roof, and with its open lower story straddling the cross-ways of the two main aisles on the floor. The stage—preferred position also for the one exhibitor who occupies its entire length and breadth—is disguised behind a huge, false proscenium arch of green, with a deep red valance, pricked off with festoons and radii of incandescent lights. The drop curtain is of red, with broad panels, vertical and horizontal, of saffron. At either side of the proscenium, mounted on panels of white plaster, are the genii of progress, each bearing a torch in either hand. Around the balcony front, on a plain white backing, are festoons of greenery, illuminated with strings of variegated colored lights. Walls, pillars and ceilings are covered with the same red, saffron and yellow tones found in the exhibition hall.

In the second floor of the latter, in the smaller, Talbot Hall, formerly entirely given over to the tender offices of the caterer, but now largely reserved for exhibitors of cars; and in the basement, the same general scheme is carried out, but with less elaboration and consequently less telling effect. Throughout the show, the carpeting of the stands is of a neutral brown—a shade well calculated to remain unchanged throughout the week. As a finishing touch to the decorations a "moving" feature is added in the shape of a group of red-garbed pages who idle about at their crimson ease.

Despite the inadvertent reference to the pagoda of melody in the center of Grand Hall as a bandstand, it must not be supposed that it was intended for the occupancy of a band. Quite to the contrary, as the woman's orchestra, soloist and all, which is one of the standard features of all Boston shows, again does battle with the patient exhibitor who is striving to advance his own interests; or charms the throngs packed into the seats which surround the balcony. Another ladies' orchestra and a pompadore brigade of male musicians discourse the latest in popular songs in other parts of the show. But the twangy piano and the youths who sold sheet music last year, are a by-gone nuisance.

All Boston rubs elbows with all East, South, North and West Boston—which is to say Chelsea and Cambridge—on the opening night of the show. This is an established custom. Judging by appearances on last Saturday night, the population of the greater city has been considerably increased within the year. It is a matter of record that breathing space was almost at a premium a year ago. This year it was unobtainable at any price. A mild-mannered local newspaper set down the attendance at 10,000 people. To one wedged into the throng in the middle of the evening, this would have seemed a gross and unwarrantable underestimate of fact. But this much must be said, that there was less of rowdyism than sometimes has been the case, and that most of the rubbing elbows were amiably inclined, so that the affair wes not seriously unpleasant.

Of exhibits of an especially conspicuous nature, aside from the handful of new cars, there are few which are really remarkable.

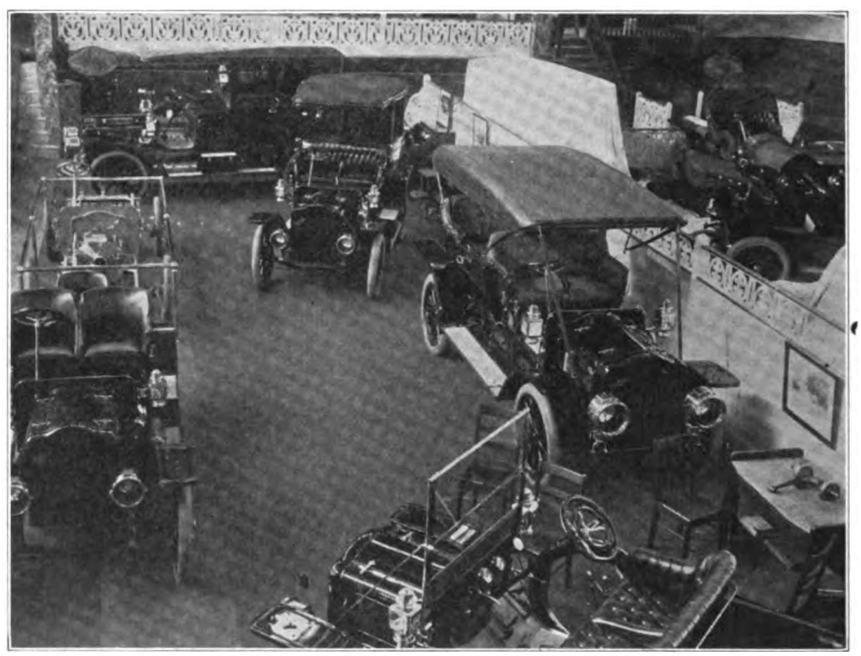
Digitized by Google

The annual appearance of the rotary steam engine is a factor to be reckoned with in this instance, to be sure, because the type presented—the Harriman—aside from the fact that it has the endorsement of a number of tests which have seemed to indicate that it possesses brighter prospects for success than many of its predecessors, also is of interest in that its inventor plans to adapt it to the purposes of the internal combustion motor. At present, however, it is shown in compound steam form and in a 5 horsepower unit, operating under its own power. Another exhibit, which is of some little importance from an educational standpoint, is that of a working model of the Burleigh motor, which comprises a section of the cylinder, with the piston shown in motion and traveling over a ground glass plate. Colored lights behind the plate, automatically regulated, reveal not simply the different periods of the cycle by their color and intensity, but also the supposed distribution of the flame in the cylinder during the firing and exhaust intervals.

Touring the aisles, the visitor encounters practically all the names which have become familiar at the other shows. For example, in Grand Hall there are the White, Oakland, Pennsylvania, Stoddard-Dayton, Pierce, Studebaker and E-M-F., Mitchell and Franklin stands. The Exhibition Hall reveals the presence of the Rambler display, as well as those of such other well known marks as the Columbia, Pope-Hartford, Marmon, Locomobile, National, Maxwell, Brush and Matheson. In Talbot Hall are displayed among others, the Waverley electrics and the Pullmans. The basement is given over principally to the display of commercial vehicles, motorcycles, of which there is a very creditable showing arranged in a single section; and machinery.

Boston's offering in new cars, while not numerous, is significant of the present sweeping movement in the industry in that it is composed entirely of medium and low priced machines. To be sure one or two makers already known in the Hub and elsewhere, are in evidence with larger cars, but with one noteworthy exception, the new cars by new makers are of the popular order. These with such cars as the Brush, the Maxwell "Junior," the Ford and one or two others might be taken as indicating a recrudescence of the one-time exceedingly popular low priced runabout, which for several years has been studiously avoided by the manufacturers. Indeed, it may be considered as a legitimate and logical development of the multiple production idea which is so widely entertained just at present. However that may be, the small and medium sized new-comers in Boston are entitled to special consideration in several instances because of their high class equipment.

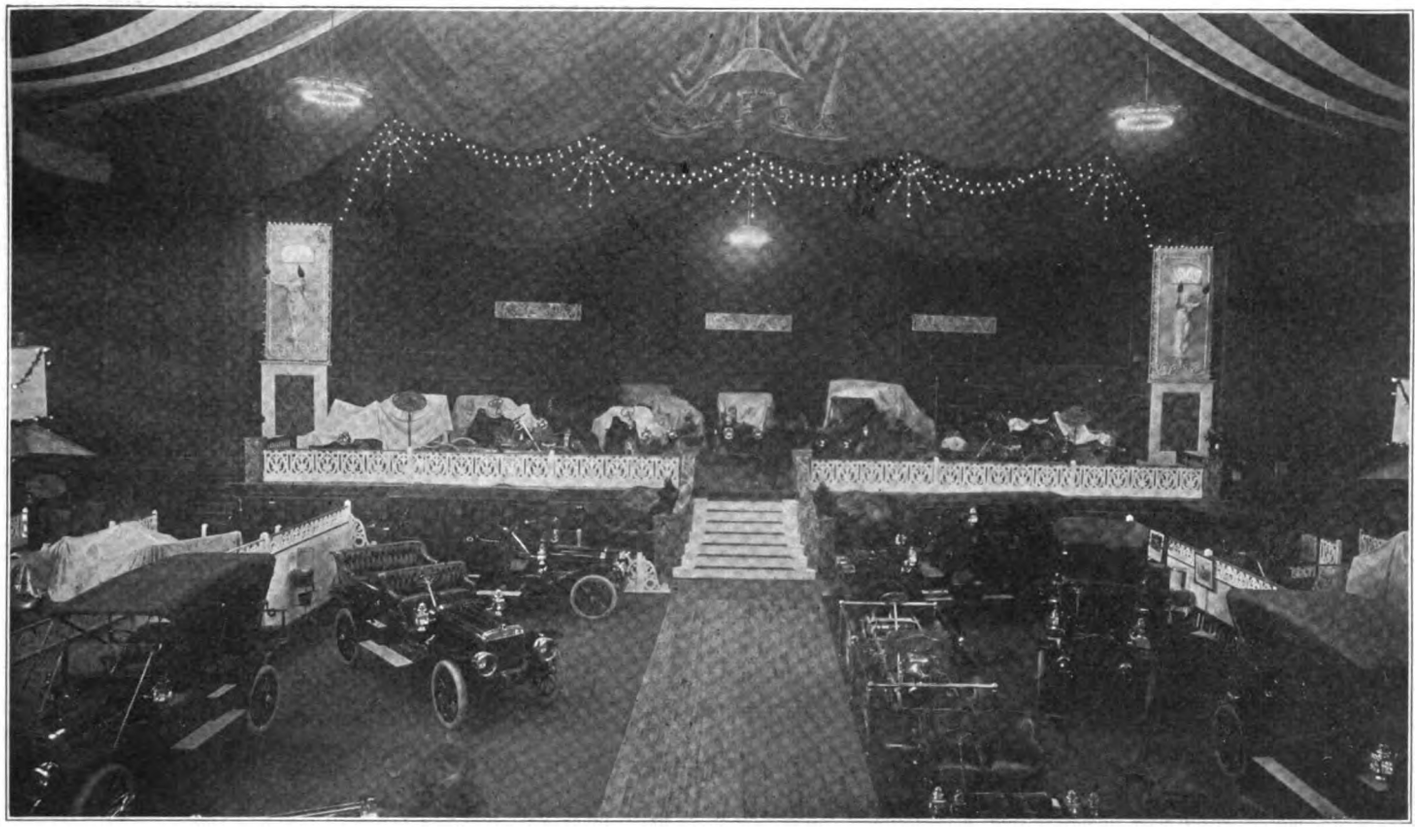
In many respects the most remarkable of these is the Hupmobile, which though listed at a minimum figure and built to diminutive specifications has all the features and linear attributes of a full sized car, together with several original—not to say, radical—components. This brand new product of the Hupp Motor Car Co., Detroit, Mich., is shown for the first time at one of the "big" automobile expositions.



Built with a weight-power ratio of nearly 2 horsepower per hundred pounds, and with such of the features accepted in standard high-class practice as quadruple, vertical motor, unit power plant, selective sliding change gear, shaft drive, it is further characterized by its makers as "the only car listing at less than $1,000 equipped with sliding gears. The only car listing at less than $1,200 with magneto as regular equipment. The only car listing at less than $1,500 having sliding gears and Bosch magneto as regular equipment."

The motor, which is water cooled and rated at 16-20 horsepower, has the favorite offset crankshaft, a fan-bladed fly wheel mounted on the forward end of the crank shaft, and measures 3¼ by 3⅜ inches cylinder dimensions. Together with the gear box, which is unusually compact, it is mounted on a pair of inverted arch members set transversely from the main frame at the front and rear of the crank case. The clutch, which is fully enclosed by the gear housing, is of the plain cone, metal to metal type, self-adjusting, and running in oil. A peculiarity of the gearset is its method of actuation which, though selective, is secured with a "T" quadrant instead of the usual gridiron form. In consequence, high and low speeds are obtained merely by moving the gear lever forward or back to the limit of its travel. To obtain the reverse it is only necessary to pull the lever inward from its neutral position.

Another original feature is the method of suspension, which is semi-elliptic in front, while in the rear, the chassis is supported by a single transverse spring. This member is secured at its center to the U-shaped cross member at the back end of the frame. Its two extremities are slidably mounted on a round cross bar reaching from end to end of the axle, and supported at either of its extremities by an arm affixed to the axle tube. A forward extension from each of the arms, is connected to one of the two diagonal cross braces which run from the axle to the front end of the torque tube. Double internal expanding brakes are employed, these and other features being practically the same as would be used on a larger machine save in detail arrangement, such as is required in instances like that of the steering group, where to economize road clearance, the steering rod is carried over to the left knuckle between the spring and the ground, instead of under the frame, as is more frequently done.



Included in the remaining specifications are the wheel base, which is 86 inches, the wheel sizes, which are 30 inches front and rear, and the tire dimensions, which are 3 inches. The weight of the complete vehicle, including full equipment, is 1,100 pounds.

Another of the newcomers which properly belongs in the same general class as the last-named machine, but which is possessed of quite different characteristics, is the Pickard, which, though appearing under a name practically unknown to the motoring public, is produced by a firm which for a number of years has been building many of the parts from which other cars have been constructed. In this way, it is by no means an untried product, though nominally a new one. In addition to the advantages of its low price, it features such characteristics which are usually found only on higher-

WHITE EXHIBIT IN GRAND HALL

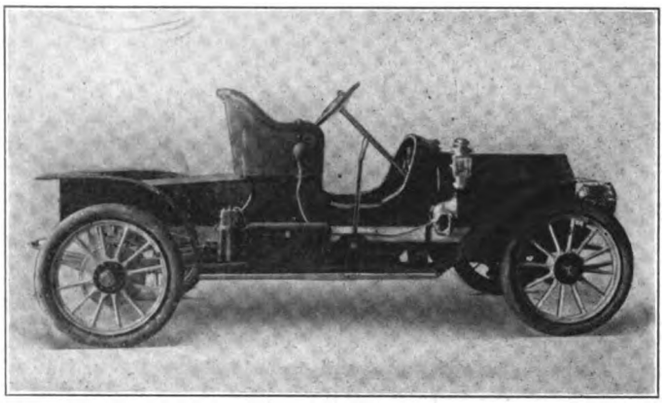
VIEW OF STAGE IN GRAND HALL, SHOWING LIGHTING EFFECTS

priced cars, as the high tension magneto ignition system, selective sliding gear, and shaft drive.

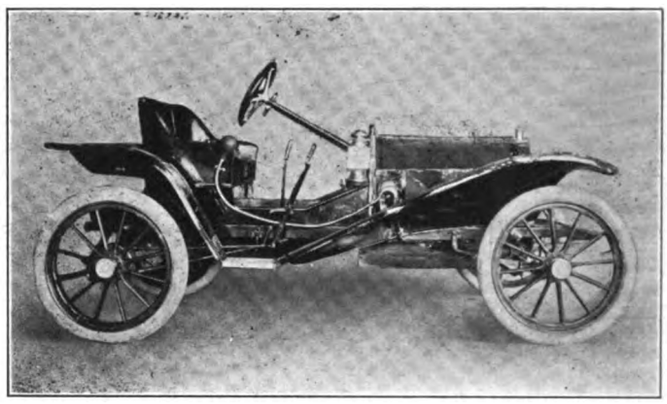
The motor, which is of the air-cooled type, and of four-cylinder, vertical construction, is a little out of the ordinary in that the valves, which are placed on opposite sides of the cylinders, are set horizontally, and worked by long rocker arms directly actuated from the cam shaft, as in another type of machine, the motors for which formerly were built by the same firm. Liberal use of extended radiating surface in the cylinder and manifold flanges afford ample cooling facilities while these are assisted by the usual fan, which is mounted on ball bearings and belt driven. The cylinder dimensions are 4 inches bore and stroke, and the rated horsepower, 25.

The change gear group is mounted immediately behind the motor, and is controlled by a single pedal—also connected with the contracting brakes on the rear hubs—and a single side lever, so contrived as to do away with the gridiron segment, despite its selective operation. A method of interlocking pedal and lever linkages serves to prevent abuse of the gears. The wheel base of the car is 100 inches, and its tire equipment 30 by 3 inches. Evidences of a desire to furnish an unusual amount of car endurance per dollar invested, in addition to the features already mentioned, are found in the use of a manganese bronze front axle, full-elliptic springs all around, ball bearing rear axle mounting and a general substantiality, which is evidenced in the general set-up of the vehicle where considered as a whole.



Efforts to produce cars at lower prices than heretofore, yet without sacrificing in any way the general form of the just now popular runabout, are by no means confined to the medium-priced range of machines, about which so much is heard, nor to the small number of attempts at producing a complete and thoroughly equipped car on a small scale. They have invaded the field of the toy vehicle, and in addition to the one example of that class of car, so far as gasolene propulsion is concerned, which has been seen at the shows during the present season. Boston also boasts another, which comes very close to it, though on the practical rather than the impractical side, so far as the intentions of its makers are concerned.

The machine in question, which is known as the Panther, is an entirely new product of local ingenuity, and while in price and size fulfilling the general requirements of the toy gasolene car, is really intended to serve a useful purpose as a runabout for general service. It is built in the simplest manner conceivable and may be characterized as having been "boiled" down to the absolute elimination of all superfluities. It runs on wire wheels, has the typical runabout type of body seating two persons, is equipped with a vertical motor mounted in front, and is controlled by the usual lever and pedal devices.



Its simplicity has been secured, first of all, by the adoption of a single cylinder motor, water cooled, but otherwise free from complications of any sort, and second, by the practical elimination of what is known to those familiar with garage technicalities as the transmission. That is to say, the motive power is transmitted through a disc clutch to a solid propeller shaft, from which the live rear axle is driven through bevel gearing. No change gear is provided, and no reverse, though one may be attached at the option of the purchaser. Speed control, therefore, is confined to whatever clutch slippage may be obtained on starting and to the regulation of the 7-8 horsepower motor. Simplicity is further obtained by the elimination of the usual differential balance gear, and the substitution for it of a simple clutch system applied to each of the rear wheels. In front, the axle is swivel mounted, and steering control is established through the use of a small chain running over a sprocket at the base of the steering column and gripping the steering knuckles. The total weight of the vehicle is 340 pounds, and it runs on 28 by 2¼ inch tires.

Considered from the viewpoint of average practice, two of the offerings of new cars presented at the show must be considered of peculiar interest, because they fall into the popular price range for cars fully equipped to carry four or five passengers, and also because they are apt to become associated more or less closely in the average mind from the fact that both represent the efforts of a single designer, though one only to the extent of utilizing a motor of his design.

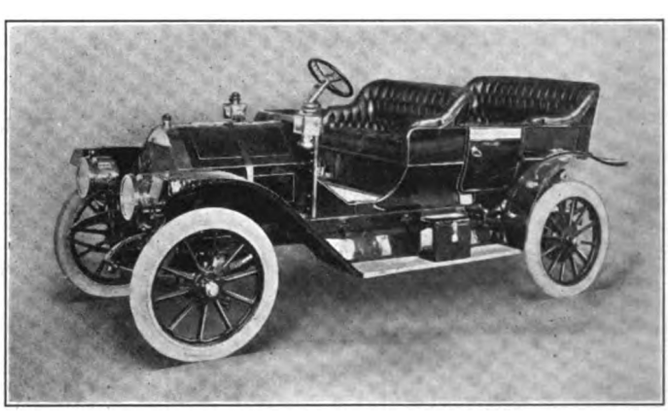
PICKARD RUNABOUT



HUPMOBILE RUNABOUT

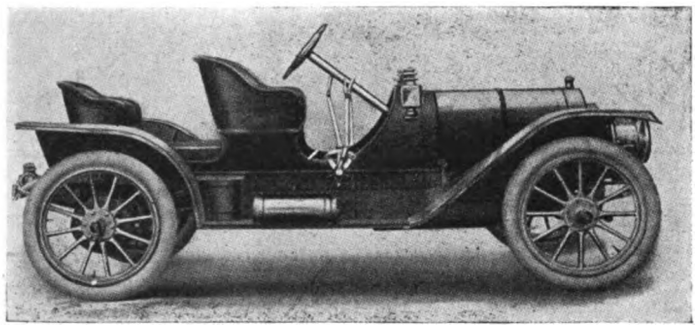
The machine in question is the new Velie, a brand new product of a brand new factory in Moline, backed by interests heavily concerned in the implement and vehicle trade of Illinois. That the Velie employs the Herreshoff motor, which is built in Connecticut, could not possibly tend to any confusion were it not for the fact that the same name just now is coming into prominence through the simultaneous introduction to the public of another and entirely distinct machine, and represents a later effort of the same drawing pencil.

The Velie is a particularly neat and attractive looking machine in which, despite its comparatively small size, an unusual amount of seating room is provided by the adoption of a particularly wide seat design for the tonneau. Happily this is done without sacrificing of consistency, so that the general appearance of the car as a whole, is made to correspond pretty closely with that of the average car of perhaps double the horsepower and size. Although uncovered within a few days at one of the local shows in the West, it comes to Boston as an entirely new thing and enjoys the conspicuous position which all novelties invariably claim.

HERRESHOFF TOURING CAR

VELIE TOURING CAR

Some idea of the general make-up of the car may be obtained from these specifications: Motor, 4 inch "square" cylinder dimensions, rated output 30 horsepower, cylinders cast in pairs; transmission by three speed, selective gearset and propeller shaft; Timken, one-piece, pressed steel rear axle, single-piece I-beam axle in front; springs, three-quarter elliptic, rear and semi-elliptic, front; wheels, 32 and 34 inches diameter, wheel base 110 inches. The Splitdorf magneto is used in connection with the double ignition system employed, and a storage battery also is furnished as a regular item in the equipment list. Two sets of plugs are used, the magneto being set on the left side of the motor and the distributor for the coil system, on the right, at the very back of the cylinders, where it is readily accessible and where its driving shaft also is useful in propelling the lubricating pump.



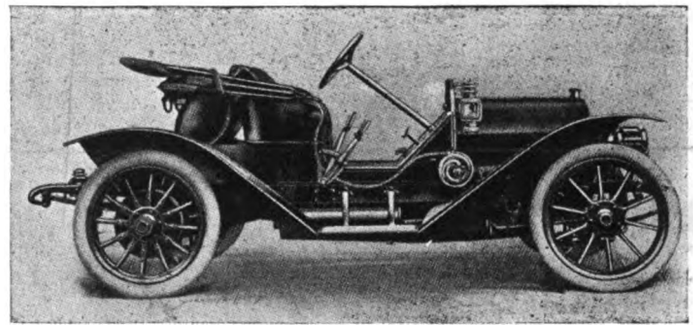
The lower part of the power plant is protected by a dust pan, which is clipped to the sub-frame, forming a neat and secure enclosure and at the same time, one which is readily demountable. In this connection also, mention should be made of the dust deflector at the rear of the body, which is worked into the body panel in practically the same manner as the small locker which in some other machines is placed under the rear seat and opened from behind. Instead of a locker in this instance, however, the apparent extension of the body back of the frame line is merely a metal plate, open below and closed at the ends, thus forming a buffer for the air currents, tending to overcome the swirling tendency of the underdraughts when the car is in motion and thus to reduce its dust-stirring proclivities. The Velie is made in no less than five different styles of body mounting—all of the unenclosed type—and carries an unusually liberal assortment of accessories which are included in the list price of the car.

Under the graphic appellation of "the smart, light cob of motor cars," the Herreshoff makes its first bow to the show-going public at Boston. In truth it is the very compact and neat appearing machine which this characterization implies. Investigation reveals evidences of close design in many points, and of the application of what is considered thoroughly approved standard practice in almost every respect. At the same time, considering the manufacturer's guarantee, of "24 horsepower delivered to the rear wheels," the motor appears surprisingly small and almost insignificant—particularly when compared with those employed by other makers of cars of the same general type and price classifications. The body lines are harmonious and modest, the interior finish comfortable and of approved arrangement and the car as a whole appears to be a worthy accession to its class.

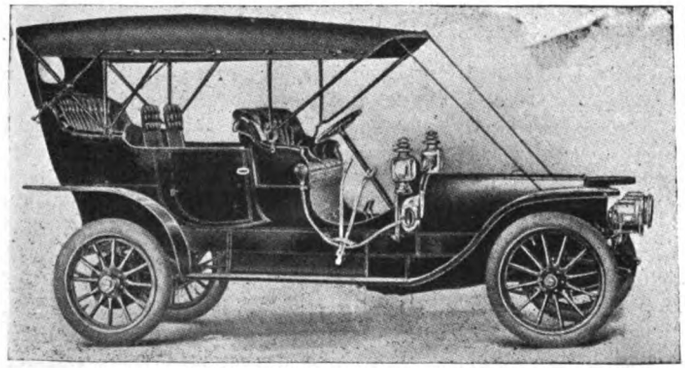
Among its special features may be noted the cylinder dimensions, which are 3⅜ by 3¾, the use of very large valves mounted on one side and actuated by a newly designed system of cushioned lifts which are intended to reduce the clatter of the parts to a minimum, thermo-syphon cooling, double ignition—the latter, however, counting as an extra where the Bosch magneto is used

Digitized by Google

in addition to the regular jump spark system with batteries. Another out of the ordinary feature is the use of the progressive type of change gear, which is thought to be more suitable for this type of car than the more familiar selective type. The unit type of power plant is used, which is to say that the gear box is bolted directly to the motor crank case and shares its support. The torque tube system of driving is employed, and the cross frame member to which the tube enclosing the driving shaft is anchored is placed just back of the gear box and well up toward the front of the car, thus reducing the angularity of the universal joint motion to a minimum. The tube with its enclosed universal joint is carried in a substantial ball and socket mounting permanently secured to the cross member, and notable because of its very large diameter, considering the size of the machine. The frame is offset in the rear to permit of the insertion of a rubber buffer to protect the axle from shock—this being rather an unusual adaptation of the offsetting idea. Ordinarily the plan is to offset the frame sufficiently to permit a generous increase in the clearance between it and the axle. But in this instance, the rubber buffer is set flush with the under side of the sill, so that the ungainly effect of the usual offset is eliminated and a perfectly unbroken frame line secured in addition to the advantage secured through the use of the buffer. The transmission is mounted on F. & S. annular ball bearings, and the axles on Timken roller equipment. The wheel sizes are 32 by 3½ inches, and the accessory equipment of high order throughout.

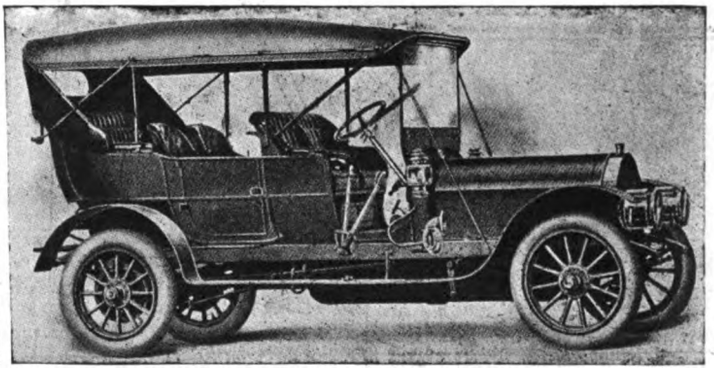


HAYNES—ON PRIVATE VIEW



It is a peculiarity of Boston shows that they never fail of being productive of something sensational in the mechanical line. In addition to the invariable crop of later new comers there always is one or another display which is truly revolutionary, radical, puzzling, and at the same time pleasing to the mechanically inclined. One time, it was a car bearing a motor which consisted of eight little cylinders surrounding the crank shaft and with their axes parallel to it, the necessary rotary motion being obtained through the medium of a circular disc which wobbled. But that is a memory now. This year is presented the compressed air system of propulsion in which the transmission of the ordinary type of car is displaced by one two-cylinder air compressor, one four-cylinder compressed air motor, one receiver or storage tank, and a few fittings which may be considered negligable. The effect of the aggregation is to secure in addition to the smoothness of operation of the steam car and the simplicity of control which that vehicle boasts, a saving in weight, a saving in first cost, and a saving in fuel efficiency. The last economy may amount to as much as 35 per cent., according to the representatives of the Compressed Air Power Co., who are on hand to explain the workings of the system.

Although this particular system is something new—so new in fact, that the model on view was barely completed in season to be put into the show—the idea upon which it is based has been advocated before. It is simply that of displacing the inflexible and more or less unwieldy mechanical linkage of the ordinary transmission system by a system employing the advantages of absolute flexibility which the fluid medium, whether it be liquid or gaseous, enjoys. In this instance, however, it is difficult to see just where the saving is effected, in as much as the casual observer is apt to be impressed with the idea that instead of a reduction in complexity there has been something of an increase, and that as compared with the ordinary gasolene vehicle there is a superabundance of mechanism. That, however, may be a result of the hasty development of the system, which, as already explained, is yet in its infancy.



The prime mover of the system is a two-cylinder air-cooled motor with opposed cylinders placed transversely of the chassis, and with its crank vertical shaft coupled to the connecting rods of two compressor cylinders, also opposed to one another, which lie fore and aft of the machine. A turbine type of fan located on the under side of the crank case serves to force a draught over the flanged heads of the gas cylinders, while a further departure from precedent is found in the use of a "regenerator" whereby the air delivered from the compressor is passed through a heater supplied from the exhaust of the gas cylinders, wherein a considerable amount of the exhaust heat is transferred to the air and the efficiency of the system correspondingly increased. From the compressor, the air is delivered direct to a four-cylinder, V-type expansion engine, of the regular steam type, which is mounted in positive relation to the propeller shaft by which the car is driven. Extra advantages accruing from the adoption of the system, as also is explained, are the air whistle and

PALMER & SINGER SKIMABOUT

FRANKLIN TOURING CAR

PIERCE-ARROW TOURING CAR

tire-inflating connections, which are a natural outcome of the storage of air in the machine.

The Compressed Air Power Co. is noteworthy in that it does not just now contemplate active production under the patents which it controls, but, instead, is preparing to license regularly constituted automobile manufacturers to employ the system in machines of their own construction. Negotiations already entered into are said to have resulted in the determination of one automobile maker to install the compressed air system in five of his cars, while others are reported as taking a live interest in the proposition. Indeed, so sanguine are the promoters of the scheme, that in a little booklet distributed in Mechanics Hall, those interested are urged to write to the compnay stating what kind of a car is desired and at what kind of a price, when the company will forward a list of 25 "leading manufacturers" who will be willing to take the applicant's order, though whether for compressed air cars or others, it is not specifically stated.

In addition to the entirely new presentations at the show, there are several instances of makers already more or less well known in the trade who are bringing out new models at this time, or who have not been present at either of the three great shows which have preceded Boston's supreme effort. Among these is the very latest type of American Napier, which the newly reorganized American Napier Co. is preparing with an especial view to meeting the conditions of American highway service. In addition to the small four-cylinder chassis which is practically the same as has been produced for several years, and which is shown in both roadster and "Nike" type mountings, there is on view a four-cylinder chassis of the latest type, which has just been produced.

This is a so-called "4-40" touring machine, which has a number of points of difference from the parent British car, notably in the construction of the rear axle, and in the manner in which it is coupled to the chassis. It is of the torque tube drive order, the tube itself terminating in a massive yoke which is hinged to a dropped, cross-frame member beneath the gear box, and which allows absolute freedom for the action of the universal joint. Supplementary spiral springs, and the new Bosch system of double ignition with the single, self-starting coil on the dash are other features new to the line and embodied on this particular model. The complete line for the coming year, it is announced, will comprise, in addition to this and the smaller machine mentioned, a six-cylinder, 60 horsepower model, and probably a fourth of 30 horsepower, but also mounting six cylinders, which is under way.

The Grout is another machine which makes its first show appearance for 1909 at this time. In its most recent guise, it is built both in roadster and touring types, which are practically equivalent so far as mechanical features are concerned, but which vary in the position of the control mechanism, the arrangement of the body, in clination of the steering column and in a few other minor respects. In place of the armored wood frame, which during the early days of Grout construction was so rigidly adhered to, the conventional pressed steel construction has been adopted, and in other respects the machine has been brought into line with the accepted standards of current practice. The motor now is rated at 35-40 horsepower, its cylinder dimensions being 4½ by 5 inches; the transmission is by selective change gear and propeller shaft; the wheel base is 116 inches, and the approximate weight 2,660 pounds.

For many years—relatively speaking, of course—Boston has been rated the steam town par excellence, of the country. Consequently the annual show has presented unusual opportunities for studying the various methods in vogue by the steam adherents. This year the contingent is smaller than it has been sometimes, only three exhibits of steam vehicles being apparent. There is, of course, the impressive display of the White machines, in the central block of the Grand Hall exhibits; there is the Lane exhibit in the Exhibition Hall, and there is the Stanley exhibit. Only the latter is making its first show appearance for the year here, and its novelty may be considered a bit impaired at that, for it has already been shown in the West during the present flood-tide of show propogation.

Several improvements are to be noted in Stanley design as compared with the methods employed last year. The same general type of construction is used, to be sure, including the wire-wound copper boiler, the horizontal, twin-cylinder motor, and the general method of mounting and assemblage. At the same time several alterations have been made, as for instance, in the adoption of the new water level indicator, which shows the level in the boiler by means of a gauge mounted on the dash and variously safe-guarded against misadventure. There also is an entirely new model designated as "U," which is equipped with a new, 4 by 5 inch engine, and which, by virtue of the greater expansion facilities which it offers, is thought to be more economical than its predecessor. Model "E2" is continued in improved form, and there also is a large touring car, known as Model "M," which is of 30 horsepower.

Rather an unexpected feature of the show is the strength exhibited in the section devoted to the display of commercial vehicles. Here are found not simply the exhibits of several of the more energetic commercial car builders who visit all the shows, both great and small, but also those of several who are less well known. The section also has been productive of some little novelty, since no less than three of the makers represented have not before appeared this year except at the local shows of smaller size and less prominence. The absolute newcomer of the group, however, is the new A. L. Co. truck, which never before has been shown, despite the fact that it has been under construction for three or four years. On this account, as well as owing to the prestige of its builders, some little curiosity existed prior to the appearance of the machine itself as to what features it would present.

Digitized by Google

The particular machine on view, is a 3-ton express wagon bearing the name of the Armstrong Transfer Co., and in chassis, revealing thoroughly standard truck construction. That is to say, the motor is mounted at the very fore part of the chassis, and under the driver's seat, while the transmission is by shaft to the gear box, located in the waist, and by double side chain to the rear wheels. Evidences of careful draughtsmanship in laying down its specifications are not wanting. One instance of particular care which is readily observable is in the independent spring mounting of the radiator whereby it is guarded against unnecessary strains. The engine, which is of the four-cylinder order, is rated very modestly at 16 horsepower when running at 800 revolutions.

Another of the new comers, so far as the present show is concerned, is the Frayer-Miller, which represents the first fruits of the renewed efforts of the Oscar Lear Automobile Co. in its recently adopted policy of concentrating upon the commercial product to the practical exclusion of pleasure cars. Three vehicles are exhibited, one a truck, one a large sight-seeing vehicle, and the third an interesting heavy delivery wagon which, despite a number of novelties in other respects still retains the original type of air-cooled motor.

Still another commercial display which is noteworthy is that of the newly organized Auto-Car Mfg. Co., which displaces the Auto-Car Equipment Co. The change in status also has brought about some little change in the attitude of the company toward the gasolene vehicle, with the result that particular stress now is being laid upon it. Visible results are apparent at the show in the shape of a half dozen machines of various powers and intended for various purposes.

Other displays which go to swell the number of commercial vehicles on view are those of the General Vehicle, Gramm-Logan, Studebaker, American and Rapid companies —the latter, as usual, appearing with the largest number of separate vehicles shown by any maker in the section, and also claiming the distinction of showing the highest powered commercial vehicle in the shape of a monster chassis which is broadly suggestive of locomotive construction in the size and obvious strength of its parts.

To the mechanically trained, Boston's show always possesses a peculiar fascination because the Mechanics Hall is equipped with a permanent source of power and because in consequence, certain enterprising exhibitors invariably are there with things that "go," and going, accomplish something. Thus there is the saw that eats its way through great masses of iron and steel as though they were hard wood, and the grinder that performs its work automatically away beyond the range of human intelligence and to the point where it would seem that having done all his work for him, it ought also to pay off the mechanic and help him on with his coat when his day's work is over. There is the model machine shop running full blast, the exhibit of flexible shafting which after being tied in hard knots continues to transmit power for practical purposes, and last but not least, the highest development of mechanical dentistry, a device which cleans—and sharpens, mind you —the teeth of files.

But when it comes to the attractions offered by way of drawing attention to the particular wares of one exhibitor or another, this year's palm leaf must be given to the oil people. It is hard, they say, for an oil manufacturer to get up a display which will prove successful as an eye-catcher. Hower that may be, they have all been pretty successful this year. In Boston there are more of them than at the other shows—or so it would seem—and this year they have been particularly successful in arranging their displays from the point of view of color. There is the Gargoyle Mobiloil booth, for instance, with its statuesque portals, its illuminated background, and its display of varicolored and instructive liquids in glasses of different sorts. The Underhay, Invader, N. Y. & N. J. and others also make a strong appeal to the passing visitor, while the White & Bagley display is novel in that besides its element of decoration, it also exhibits a portion of the company's laboratory equipment, willing attendants always being at hand to explain the workings of the viscosimeter and the flash pan, as well as the value of the tests which they yield.

Next to lubricants, perhaps the most telling effect produced by the manufacturers and purveyors of ignition supplies who, particularly if they happen to have something like a coil or a plug from which a spark can be drawn, are in a fair way to secure all the attention they covet. Several new things are to be found in this particular contingent, by the way. There is the Winestock plug, for instance, which is a plug within a plug, built of brass and so contrived that it can be removed from the shell for testing purposes by a mere twist of the wrist, and without the necessity of disconnecting the lead. Furthermore, this particular plug has an annular gap for the spark, which is adjustable, and which possesses non-sooting properties which are held to recommend it very highly. Worcester spark coils, which are also new, possess a number of useful advantages in vibrator construction, in the method of connecting the high tension leads, and in the construction of the switch, which requires no wiring whatever but is connected automatically upon being secured to the outside of the coil box. The Holtzer-Cabot Electric Co., which for years has produced small motors for industrial purposes, now has gone pretty heavily into the construction of automobile ignition apparatus in the production of magnetos, coils, and igniters, while it also displays a useful array of small portable electric driving devices for machine tools. In the Burns Boston Battery & Mfg. Co.'s product is found a primary cell of the liquid type, but perfectly sealed, so that it can neither spill nor evaporate and therefore will last much longer than the ordinary cell of either of the common types, in consequence of which it is recommended as a standby where the dry cell would not be available because of its tendency to deteriorate if allowed to stand too long. The Hermatic battery case which A. S. Morse Co. shows, is both a water-proof housing for the battery and a system of plastic packing. Its efficacy is attested by the display of one of the cases reposing in a glass jar of water and furnishing current for a snappy little dancing spark which draws the attention to the exhibit. As is the case with most other coil makers, the Federal Mfg. Co., lays considerable stress on the construction of the vibrators employed on its Bliss coils, which are claimed to be both fool-proof and durable besides having a quality of workmanship which is possible only in expensive goods.

Boston's own quota of speed indicating devices, naturally is on hand with something to show. There are the National, Casgrain Loring, Star, and others, for example, in addition to the Jones, Stewart, Warner and others, which have been "on the road" all through the present show season. Shock absorbers, too, are much in evidence, among the Gabriel, Hartford, Kilgore and other lines being found one or two, which have not been seen before. This is true of both the Boston Shock Absorber, which is shown by the Knapp-Greenwood Co., and which is of the hydraulic piston type; and the Monarch, which is a friction system depending upon the pressure of a spring-actuated plunger upon a graduated cam surface.

Shock absorbers lead to tires, and there are several new comers here, even, as the tires of the Shawmut Tire Co., which are fabricated by a special process claimed to be of especial advantage in preserving the durable qualities of the rubber as well as its full elasticity. The non-puncturable inner cases produced by the Atlas Rubber Co. possess that virtue by reason of the fact that they have a certain amount of steel armor incorporated in their make-up. Federal tires, though made in Milwaukee, are exhibited by the Standard Tire and Rubber Co., New England agents, and are shown in a variety of styles. Besides, of course, there are the regular show attendants in the tire line: Hartford, Diamond, Continental, Michelin, Ajax, Empire, Firestone, G J, and that continual source of wonder to the untoutored visitor, the Dow, into which endless quantities of nails continue to be driven to the perpetual delectation of the crowd.

Tire helps abound, like the new Standard Combination motor rim, an expansible and contractible device which by simple means is made to grip the wheel rim with

Digitized by Google

VIEW OF SECOND FLOOR WHERE ACCESSORIES HOLD SWAY

tremendous force, or to release it absolutely according to the manipulation of a special form of key which goes with it. Of course, tire accessories are present in abundant variety, while such other tire helps as Supplementary Spiral Springs, Sager Equalizers and the various other spring devices are regarded as of due importance by the showgoer. For the motorist who is anxious to rid himself entirely of the pneumatic tire, there is the Seaton spring wheel—a brand new "wheel within a wheel."

Materials, manufactured in various degrees are well represented, among the newcomers to be observed in this class being the Lebanon Steel Casting Co., with plausible arguments as to the advantages of their own methods of carrying on the work of the steel foundry; and the Rhineland ball bearings, which are of the annular type, produced in a very wide range of styles, and as made for very light loads, distinctive in that pressed steel races are employed in the thrust type.

The complete list of the exhibitors and their wares is as follows:

NEW DETACHABLE LINK CHAIN

Diamond Design Adapted to Easy Removal and Security in Running—Interchangeable with Riveted Chain.

Detachable features for automobile chains have been the subject of much improvement since the first requirements in this direction were observed, the latest development of the kind being a new detachable link chain produced by the Diamond Chain & Mfg. Co., of Indianapolis, Ind., embodying an arrangement of the parts and a design which is calculated to provide both the quality of easy removal of the links when the user desires it and security in running. As shown in the accompanying illustration, a thin strip steel lock over each outside link slips into a groove around the rivet surface, and turning on one rivet as a center, goes

into place in a similar groove on the other rivet, thus preventing the side bar proper from coming off. The strip itself is locked into position by being slightly warped inward and having at its center an inward projection which snaps into a depression in the side bar. Once snapped into place the strip cannot change its position unless the intentional upward pressure is exerted on the clip at the end. The chain is made of the same materials and with the same accuracy as the well known Diamond riveted chains, with no increase in the price over the latter. The links and parts of both will be interchangeable with each other.

Handbook of Shipping Instructions.

Many matters relating to the shipping of automobiles to foreign countries are made clear in a special automobile edition of "Aids to Shippers," a substantially bound book of about 60 pages, issued with the compliments of the forwarding department of Oelrichs & Co., of New York City, general agents for the North German Lloyd. Five pages are devoted especially to motor cars, giving pertinent information concerning packing, customs, ocean freight, insurance, frontier passes, licenses, consular invoices, and the details of proper shipping instructions. Conversion tables of money, weights and measures are contained in the book, together with considerable text matter setting forth facts and explanations which are calculated to be of great value to either the private owner or the trade exporter.

Catalog that Tells a Story.

Pictures showing views associated with some of the car's more conspicuous victories, such as winning the Vanderbilt cup and the Philadelphia Founders Week trophy, together with photographic scenes depicting the company's product in touring service at home and abroad and in more commercial uses, form an excellent accompaniment to the description of the 1909 models in the handsome 48-page catalog just issued by the Locomobile Co. of America, Bridgeport, Conn. The book, which bears a cover in gold and colors, is the company's eleventh annual edition. The new, shaft drive Locomobile "30," and the other models marketed by the company are carefully described, as well as being illustrated in detail by means of line drawings and half tone illustrations.

Aids to Judging an Automobile.

As a specimen of informative rather than merely laudatory literature, "How to Judge an Automobile," a 24-page series of treatises by Ernest Coler, is an excellent example because of the clear and simple way in which some of the more important technical phases of motor car construction are presented. The document shows why three-point suspension, thermo-syphon cooling, unit construction, multiple disc clutches and other important features are incorporated in Maxwell cars, as made by the Maxwell-Briscoe Motor Co., of Tarrytown, N. Y., numerous striking illustrations and diagrams supplementing the text.

Perpetual Guarantee for Spark Plugs.

Perpetual guarantees on spark plugs represent an innovation in the field which both indicates the increased reliability of this important accessory and foreshadow a necessary readjustment of the business to a certain extent. The first manufacturer to promulgate the perpetual guarantee is the R. E. Hardy Co., of New York and Chicago, concerning whose Sta-Rite plugs the announcement is made that whenever returned to the factory at New York they will be made as good as new, no matter how long they have been in use.

Tires That Big Officials Use.

Use of automobiles by official Washington does not give car makers alone the opportunity of "crowing" over the endorsement of their products which purchase implies. Occasion is taken by the Diamond Rubber Co., of Akron, O., to "point with pride" to the fact that Diamond tires are the equipment of the machines used by President Taft, Vice-President Sherman and Speaker Cannon, all of whom employ the automobile as their usual conveyance in journeys in and about the capital.

FOR FIRST AID IN TIRE TROUBLE

The Wiles Tire Sleeve Designed for Quickness of Application—Goes on Without Lacing and Holds Fast.

Jealous always of the reputation of their products, the big tire makers are generally loath to associate their names with minor tire accessories except in instances where the merits of the latter are established, which perhaps explains why it was for a long time left to outside inventors and small factories to produce the tire "sleeves" or emergency protectors, sometimes called manchions. Recently, however, the Diamond Rubber Co., of Akron, O., brought out a "first aid" of this kind, known as the Wiles tire sleeve, which its manufacturers are not averse to standing back of in every way. As shown in the accompanying illus-

tration, the device covers every portion of the tire section above the rim. In spite of the fact that it is put on without lacing and can therefore be applied in an instant, it is claimed that it absolutely will not creep in service. It is intended for tread punctures, but is equally good for a rim or a blowout. The quality of the rubber and the Sea Island fabric used in its construction is calculated to give it the highest degree of wear resistance.

Suit Brought for Inadequate Performance.

Suggestive of the caution that should accompany representations and guarantees as to the capabilities of machines, suit has been brought against the Fritchle Automobile & Battery Co., of Denver, Colo., makers of electric vehicles, for the recovery of $4,000 damages, on the allegation that two of the company's cars did not come up to the requirements of the contract sale. In the complaint it is set forth that the plaintiffs purchased two machines, at $2,000 each, on the guarantee that the cars would run 80 miles on one charge and that the batteries would last at least 5,000 miles. It is charged that the cars are defective in workmanship and material; that they would not run more than 40 miles on one charge, and that the batteries were not capable of propelling the cars for 5,000 miles of service. The complainants ask for the return of the full purchase price of the vehicles.

PRESIDENT TAFT GETS A GARAGE

White House Transformed for New Executive's Convenience—And His Vehicles are the White Type.

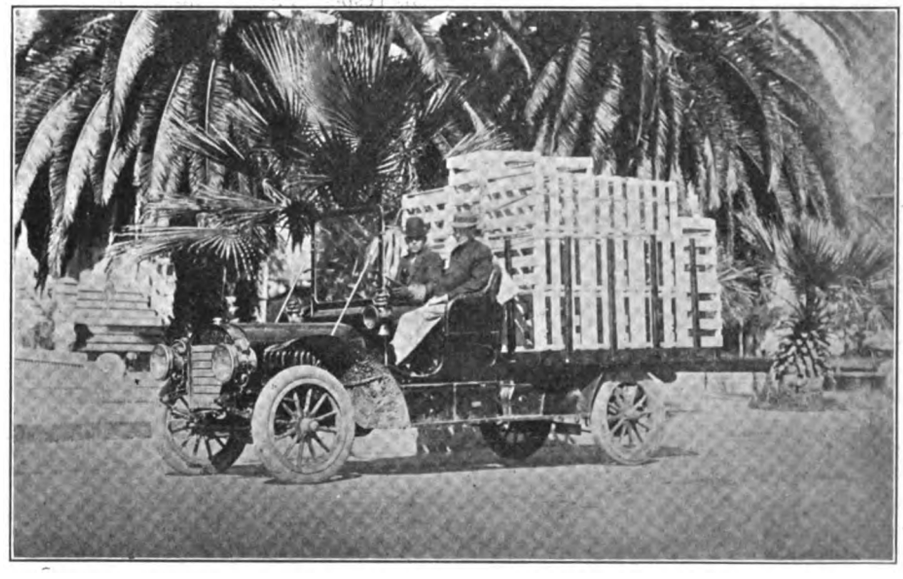
Busy as Mrs. Taft has been in rearranging the White House furniture and in altering the details of management in the presidential household, none of the changes that have taken place in the executive mansion itself begins to approach the radical upsetting of former practice that has occurred in the "White House stable," which is really no longer a "stable" in the usual sense, but a garage. The change was made with such quickness and completeness as almost to take away the breath of those who were familiar with the one story brick structure on Seventeenth street as the shelter for the horses and carriages of the presidents.

PRESIDENT TAFT'S WHITE STEAMER LEAVING THE GARAGE

In contrast to the enthusiasm over horses and equestrianism entertained by his predecessor, President Taft much prefers the motor car, a preference which he plainly indicated before his election, but which he has since confirmed with even more force than was expected. As a consequence the accommodations provided for the chief executive's vehicles have undergone a prompt conversion to suitability for automobile housing and maintenance. Without doubt the establishment eventually will be made a model one in its features of convenience for keeping the presidential vehicles in constant readiness.

To direct whatever changes might be required to adapt the structure to garage purposes, President Taft selected W. C. Sterling, the Washington representative of the White Co., who found that all the necessary alterations could be made at an expense of a few hundred dollars, the principal item being the installation of a gasolene tank. The establishment will be in charge of George Robinson, who has been detailed from his duties in the war department to drive the presidential White steamer which Mr. Taft purchased for his personal use and which in the accompanying picture is shown starting from the garage to the White House. This, together with two other machines, constitutes a vehicular equipment unlike that enjoyed by any previous president, providing a combination of speed, comfort and safety that will contribute to executive efficiency and benefit.

FARMER'S MOTOR MARKET TRUCK



Californian Adopts a Rambler to the Transportation of Produce—Features of a Big Burden Bearer.

Among the many interesting possibilities of the commercial motor vehicle, perhaps none has been given greater prominence during the past year or so than that which will follow its widespread adoption by the agriculturalist. The farmer's car, in fact, that is to say, the machine built especially to satisfy his varied requirements, already has appeared.

Along the San Fernando road, near Los Angeles, Cal., for example, people who get up at daylight frequently see a large commercial vehicle rolling smoothly along with a ton of boxes and crates piled high on the body.

The truck is a Rambler chassis with a special interchangeable body built in Los Angeles. Its owner, J. Q. Adams, of Eagle Rock, has adopted this method of making his morning deliveries of garden produce in that section in preference to the more familiar method. He had been using three wagons to transport his merchandise, but found that in muddy weather there was a great loss of time on the road. The car is "making good."

The machine is a rebuilt touring car with tonneau removed, and frame lengthened 15 inches, thus affording room for a good sized loading platform which is well supported by the 127 inches of wheel base, which the lengthening out process has provided. The power plant comprises a 40 horsepower motor and double chain transmission. The tire equipment includes solid tires on the rear wheels.

CALIFORNIA FARMER'S CONVERTED RAMBLER TRUCK

LAWS THAT MAY PROMOTE GRAFT

Objectionable Features in Bills Before the Pennsylvania Legislature—Will be Opposed by Motorists.

Two bills now pending in the Pennsylvania legislature are identical in the matter of certain provisions that are regarded as extremely objectionable by the Pennsylvania Motor Federation, which will endeavor to prevent their enactment into law. They are embodied in a clause empowering the commissioners of any county to adopt and prescribe reasonable rules regulating and restricting the use of roads within such county by any means of locomotion and to prescribe pecuniary penalties for violation. These provisions practically empower the commissioners to fix as low a rate of speed for motor vehicles as they may desire, and makes possible the imposition of a fine as high as $100 on conviction of overspeeding. But the especially obnoxious feature of the clause is the provision that "any resident of any county within which the violation of any rule so adopted shall occur may institute and prosecute to judgment and execution an action of assumpsit in any court having jurisdiction in such actions and the amount involved for the recovery of any penalty for the violation of any rule prescribed by the Commissioners, of which penalty the plaintiff shall be entitled to one-half and the county shall be entitled to the other half payable to the county treasurer, who shall add the same to the fund for the improvement of the said country roads."

Basing Taxation upon Bore of Cylinders.

The French government has evolved a new basis for the taxation of motor cars according to horsepower in concurrence with the amendment of the law regarding their assessment. Under the proposed new schedule only the bore of the cylinders is taken into consideration in determining the rating for purposes of taxation, all other dimensions being disregarded. In four cylinder motors a bore of 85 mm. will be considered equivalent to 14 horsepower; 90 mm. 16 horsepower; 95 mm., 19 horsepower; 100 mm., 21 horsepower; 110 mm., 28 horsepower; 120 mm., 36 horsepower, and 130 mm., 45 horsepower. For two cylinder engines with a corresponding cylinder diameter the rating will be halved while a single cylinder motor will be credited with one-fourth the above power. With sixes whose bore is the same as a four, the rating is advanced 50 per cent.

Police Automobile Dream Vanishes.

To save and save and save for an automobile, and then have to turn the money back just as the fund had reached the point where a good car was possible—such is the setback to thrift that has been given the police department of Cleveland, O. By not filling vacancies in the force, over $2,500 was saved in the funds for the fiscal year, and this sum the department planned to use for the purchase of a machine, but the city's law department has ruled that the money must be returned to the general fund, and that if the police department is to get an automobile, it must be by special action of the city council.

New York-Philadelphia Motor Stage.

Automobile service between New York City and Philadelphia has been instituted on a regular schedule, the terminals of the route being the Waldorf-Astoria in Manhattan and the Bellevue-Stratford in the Quaker City. The machine used is a six cylinder Acme limousine, seating five passengers in addition to the driver and having accommodations for considerable baggage. The fare is $15 per passenger, and the time consumed for the trip is from five to six hours, starting at 10 o'clock. A stop of one hour for luncheon is made at New Brunswick, N. J. At present only one car is employed, making the journeys back and forth on alternate days. As the season advances and the expected patronage increases, daily service will be provided in both directions. A further extension of the project contemplates the placing of cars on the route between Philadelphia and Atlantic City.

Parisian Suburb Wars Against Smoke.

In France the emission of smoke from a car means a police summons for the driver. For some time the police of Suresnes, the suburb of Paris, where several motor car factories are located, have been extremely zealous in the performance of their duty in this respect and a highly profitable business has resulted for the courts. As most of the offending cars were stripped chassis taking their "exams" before graduation, the makers regard the many summonses as a persecution. They have appointed a committee to visit the prefect of police and voice their opinions in the matter and request a little more leeway in their cases.

Rochester Club to Have a Banquet.

Business and pleasure will be combined by the Automobile Club of Rochester, N. Y., on the 29th inst.; the annual election and banquet being scheduled to occur on that date. The club has issued a statement to the effect that it has no connection with either of the local automobile shows which are billed to take place this month.

Johnstown Club Holds Annual Election.

The Johnstown (Pa.) Automobile Club at its recent annual meeting elected the following officers for the coming year: C. S. Price, president; John M. Rose, vice-president; W. F. Muddock, secretary; R. G. Rose, treasurer; board of directors, North West, F. B. Cook, J. L. Replogle, T. M. Price, and Dr. F. Schill, Jr.

GRADUATED TAXATION IN VERMONT

Registration Fees Under New Law Determined by Horsepower of Machine—Heavy Tax on Non-Residents.

Vermont has placed upon the statute books of the State a law which may yield an income of $40,000 per year, but is fully as likely to keep out of the State more than that amount of profit for summer business. Before adjourning the legislature enacted the measure, hitherto noted in the Motor World, taxing motor vehicles according to their horsepower. The new law fixes the operator's fee at $2, and the registration fee for a new machine at $1 for each horsepower the first year, 75 per cent. of that amount the second year and 50 per cent, the third year and thereafter, it being necessary to register annually. Non-residents will be permitted to operate machines in the State during a period of not exceeding 60 days upon the payment of $3 for machines of less than 20 horsepower, $6 for machines of less than 40 horsepower, and $10 for those of 40 horsepower and over. There is only one liberal feature about the law, and that is the provision that motorists of other States extending a like privilege to Vermont motorists shall be exempt from the visitors' registration regulation for a period of 10 days. The law was passed through the House early in the session, with little opposition. It met with considerable opposition in the Senate, but was carried through by the agricultural interests.

Cambridge University Restricts Motoring.

Because of the lively automobile exploits of the students, Cambridge university has forbidden the latter from using their motor cars within its precincts except by special license obtained from the tutors and the senior proctor. Cars can only be hired after filling out a special form of registration, subject to approval, and Sunday motoring at the English university is prohibited entirely. Suspension, rustication or expulsion will be applied to students offending, and the automobile dealers of the vicinity have been warned that if they lend aid to evasions of the rules, they will be "discommuned" from university patronage.

Woman's Motoring Too Exhilarating.

On her promise to use street cars instead of automobiles in the future, Mrs. Mary Gessler, of Cleveland, O., has been put on probation by the court, and will not have to go to jail. Her husband complained that she had a mania for automobile rides, to the neglect of her home and children, and that so stimulating and exciting was the speed effect on her nerves that she took recourse to more than liberal quantities of champagne, resulting in his having her arrested on a charge of special intoxication.

REVISING LAW IN CONNECTICUT

Legislative Committee Gives Extended Hearings on Proposed Amendments—Features of Some Important Bills.

In a series of hearings which occupied three days, March 3 to 5 inclusive, the committee on roads, bridges and rivers, of the Connecticut legislature, had an opportunity to consider automobile legislation from nearly every point of view. The hearings were held at Hartford and were very largely attended by representatives of motoring organizations, unattached motorists, farmers, business men and the general public. The views expressed were widely divergent, but there was much sentiment in favor of the existing law, the main criticism of the present situation being that there is laxity in the enforcement of the law as it stands. Of several bills that were considered, perhaps the most important was one introduced by Senator Heineman, of Meriden, which provides for the appointment of a commissioner of motor vehicles by the governor for a term of two years at an annual salary of $2,000. This bill provides that public examinations shall be held in the various cities and towns in the state once a year. At such times applicants for license shall appear in person and be examined as to their moral character, etc., and if they are 21 years of age, have a good practical knowledge of motor vehicles and possess sufficient skill and ability to properly operate a car, a license to operate shall be issued to them for a period of one year. The commissioner is to have an office at the Capitol, make annual reports to the governor, etc. The commissioner, under the bill, will have the authority to revoke licenses for gross negligence or repeated violations of the law. Such revocations may be nullified at the expiration of 30 days. The original fee for such examination is placed at $5, and $3 for renewal. To the commissioner is also given the enforcement of the speed law, and other particulars.

A second bill, fathered by Senator Peck of Stamford, changes the present law in several particulars. It would prohibit any person under 18 years of age driving a car, even though accompanied by a licensed chauffeur. It also provides for the revocation of licenses upon conviction of violation of the law, and puts teeth into the present law covering this feature. It reduces the speed at which automobiles may be driven within city or borough limits to 12 miles an hour, and expunges the present one-eighth of a mile provision. It provides that an operator upon approaching a trolley car discharging or taking on passengers shall reduce the speed of his machine, but does not provide that it shall be stopped.

A third bill amends Section 14 of the present law by authorizing local officials to set apart certain sections of highway for a specified time for speed contests. The fourth bill deals wholly with registration fees, and provides for these increases: Less than 20 horsepower, from $3 to $6; from 20 to 30 horsepower, from $5 to $10; over 30 horsepower, from $10 to $20.

Declares the Automobile a Weapon.

Automobiles are weapons, according to a decision rendered by the Superior Court of Georgia during the last week in February. Sanford Moreland was tried at Jonesboro on a charge of assault with intent to murder with an automobile, which the indictment declared was a "weapon or machine likely to produce death." The facts in the case were that on December 20th last, the defendant was driving a car, belonging to the late Ben L. Jones, from Atlanta to Macon when A. D. Smith's horse took fright at the machine. Mrs. Smith, who was with her husband, alighted from the buggy and attempted to run across the road, but was knocked down and severely hurt. In the trial the prosecution failed to show intent to kill or injure and Judge Roan submitted to the jury only the question of negligence. Moreland was found guilty and sentenced to twelve months on the chain gang.

Fighting Double Taxation in Ohio.

There is strife between the city of Columbus, O., and its automobiling residents, the bone of contention being the question of the city's right to exact a license fee of $7.50, as provided for in a section of the vehicle license ordinance. The Columbus Automobile club, through one of its members, William M. Frisbie, brought a test suit recently on the ground that the city ordinance conflicted with the State law. The club sought to enjoin the city from collecting the fee, and a temporary restraining order was allowed. This order was dissolved by Judge Dillon, of the Common Pleas Court, on the 1st inst., and as a result Frisbie applied the next day to the Circuit Court for a temporary injunction restraining the city from collecting the fee. It was granted and the fight now is transferred to the last named court. It will be carried up to the Supreme Court if necessary.

Fined for Carrying Too Many Tags.

Another of the many issues possible under the Massachusetts automobile laws was raised in the municipal court at Boston on the 4th inst., when Reginald B. O'Callaghan pleaded not guilty to operating a car having numbers not prescribed by the highway commission. It was alleged that the defendant's machine bore, in addition to this year's number plates, one of last year. Counsel for O'Callaghan contended that there was no regulation which compelled the removal of the plates of a preceding year, but Judge Parmenter decided that such an interpretation could not be properly placed on the law and fined O'Callaghan $10, from which the latter appealed.

BARRING THE DOUBLE DECKERS

New York Park Board Excludes Motor Omnibuses from Riverside Drive—Operating Company Opens Legal Fight.

By an order adopted by the Park Board of New York City, vehicles more than ten feet high are barred from Riverside Drive. This order is a solar plexus blow at the Fifth Avenue Coach Co., which is operating 35 double deck motor omnibuses on Fifth avenue and also on Riverside Drive as far as 135th street. These vehicles are 12 feet high and Park Commissioner Henry Smith asserts that they are so high that they injure the low hanging limbs of some of the trees along the drive.

For violation of the rule Eugene Schellenberg, driver of one of the motor omnibuses was arrested on February 15th, and was up for examination in the Morrisania Court on Tuesday, 2d inst. After listening to the arguments of the Corporation Counsel, representing the Park Department, and William H. Page, Jr., who appeared on behalf of the Fifth Avenue Coach Co., Magistrate O'Connor declined to dismiss the complaint and the case will be thrashed out in the Supreme Court.

As against the claim that the vehicles injure the trees, an official of the coach company says: "There is no real danger to the trees (or to the passengers either), as our 'buses are lower than similar vehicles in use on the avenues and boulevards of London, Paris and other European cities, where conditions exist exactly similar to those on Riverside Drive. In one or two sections along our route there are a few trees whose branches extend over the roadway in such a manner that they might brush against the passengers on the upper seats; but all that is necessary would be to prune the trees, which would in no way mar their appearance.

"Instead of doing this, the Park Department want to stop the operation of our 'buses, and prevent thousands of New Yorkers and out-of-town visitors from enjoying, at a moderate cost, a trip over the finest drive in the city. With our new service we expect to carry from 7,000 to 10,000 passengers daily, and it would work not only a hardship on us, but on the public as well to deprive them of the privilege of using the Drive. Not only this, but the sight-seeing 'buses, many of which are quite as high as our 'buses, have used Central Park and Riverside Drive for years without interference, and have never caused any damage to the trees."

To Improve Qualifications of Chauffeurs.

The San Antonio (Tex.) Automobile Club is favoring the passage of an ordinance to require chauffeurs to pass a mental and physical examination.

RACE ON FOR CAMPBELL TROPHY

Twenty-one Entrants in New York to Boston Endurance Run—Schedule and Rules for the Contest.

The contest for the trophy offered by Chester I. Campbell, manager of the Boston Automobile Show to the winner of the annual New York-Boston endurance run, which is held during the week of the Boston show, will start from Columbus Circle to-day (Thursday), at 6.30 a. m., instead of 8 o'clock, as at first proposed. While fears have been expressed that the contest would result in a race, reports which have come in from entrants who have been over the course indicate that the mid-winter conditions which prevail will preclude the possibility of a scorch resulting. A schedule of 20 miles an hour has been laid down and calls for the completion of the 243 miles in 12 hours and 9 minutes. The rules provide for immediate disqualification of any contestant who is arrested for exceeding the legal limit. Cars which arrive ahead of their schedule will not be allowed to check in before the expiration of their time allowance. For each minute or fraction thereof of tardiness a penalization of one point will be inflicted and 50 points will be charged against contestants who arrive 30 minutes or more late. Cutting out a control will mean disqualification.

In the event of a tie it is provided that the clean score cars may be sent over the course again until a winner is evolved or lots drawn to decide the tie, at the discretion of the referee. An international aspect is given to the contest by the participation of several foreign contenders. The checking stations and times of arrival at each are as follows: New Haven, New Haven House, 10.30 a. m.; Hartford, Heublein Hotel, 12.36 p. m.; Worcester, Worcester Automobile Club, 4.33 p. m., and the finish at Huntington avenue and West Newton street, Boston, 6.39 p. m. Twenty-one cars had been nominated when the entries closed Tuesday, but more are expected to come in at the last moment.

Premier's Disqualification Stands.

Showing a supreme disregard for the authority of the contest committee of the American Automobile Association which restored the Premier car to its former status after it had been disqualified by the Quaker City Motor Club the latter by its recent action has again put the Premier out of the running for first place. This time the sidetrack is beyond all hope of intervention and completely undermines all claims of the Premier to its eligibility to first place. Although the car passed the technical committee's examination at the conclusion of the New Year's Day endurance run with a clean score, no notice was taken of its road record owing to its disqualification, as now is explained. In view of its reinstatement its road record was looked up with the result that the car was found to have passed several checking stations on the return trip away in advance of its schedule. With a penalty of two points inflicted for each minute the car was ahead of time at controls and at the finish the total penalization amounts to 270 points, which is an insurmountable barrier. This action on the part of the club seems to be the last word in this controversy.

Tardy Disqualification of Sharp Arrow.

At this late day, long after all but those who were vitally concerned had forgotten it, the protest filed by another competitor against the Sharp Arrow car which won the Garden City Sweepstakes in the Motor Parkway races last fall, has been sustained by Referee W. K. Vanderbilt, Jr. The protest was filed on the ground that the Sharp Arrow was a specially built car and the wide margin by which it won its event, which was open to stock cars selling between $2,001 and $3,000, directed attention to the size of its power plant. The rules specified that at least ten cars of the competing model must have been previously built and as the Sharp Arrow was a newcomer it was asserted that these conditions had not been complied with, thereby in a technical sense classing the Sharp Arrow as a specially built car. The findings of the referee sustains the contention of the protest and disqualifies the Sharp Arrow, thereby advancing the Knox, which finished second, to first place, and giving the Stoddard-Dayton, which came in third, second position.

Norristown Fixes Dates for Its Run.

At its regular meeting last week the Norristown (Pa.) Automobile Club, which has an endurance run on the tapis for next May, after a spirited discussion between the advocates of both routes, rejected the recommendation of its contest committee to make Wilkes-Barre the turning point of the contest and selected Hagerstown, Md., instead. The event will take place on May 18 and 19, and the night control will be at Hagerstown. The following committee will have charge of the event: William Magee, George Altemus, Sidney Ballard, Oliver F. Lenhardt and Fred Jaquith. The election of officers resulted as follows: John H. Rex, president; Fred Jaquith, vice-president; William Hart, secretary; Earl Wentz, assistant secretary; Lewis E. Taubel, treasurer.

Atlanta Schedules a Hill Climb.

Atlanta's (Ga.) third annual hill climb will be held on the 27th inst. As in the previous cases the course will be laid on the Stewart avenue hill.

"The A B C of Electricity." Price, 50c. The Motor World Publishing Co., 154 Nassau Street, New York City.

FAMOUS DRIVER'S CAREER CLOSES

Leon Thery's Death Announced from Paris—Winner of Many Trophies Who Forsook Sport for Trade.

Leon Thery, at one time the most famous automobile race driver in the world, and later a manufacturer of motor cars, died in Paris on the 8th inst. His fame reached its climax in 1905 when he repeated his 1904 performance, of winning both the French elimination trial and the Gordon-Bennett cup race itself. His first race was in 1898, from Paris to Amsterdam, driving a voiturette. In 1899 he competed in the Tour de France, and was classed second to Gabriel in the voiturette class. In the criterium for voiturettes, which was won by Cottereau in the same year, he was also second. In 1900 Thery won the cup for voiturettes on the road from Bordeaux to Periguez, and in 1901 he was fifth in the light car class in the Paris-Bordeaux race. Just before the Paris-Berlin contest he was taken ill, and could not compete. In 1902 he took part in the Paris-Vienna race, had a bad accident in coming down the Arlberg, and repaired his car in a remarkable manner in a single day and finished the race. Toward the end of the same season he won the hill climbing contest at Gaillon and broke the kilometer record for light cars, being the first to make a speed of 120 kilometers per hour. In the Paris-Madrid of 1903 he was fourth in the light car class. Following his two brilliant winnings of the Gordon-Bennett event, he retired to become a maker of cars, in which field he met with modest success. He was 30 years of age.

Death of a Pioneer Inventor.

William A. Austin, who is credited with having invented one of the earliest steam automobiles to be shown in the United States, died suddenly at his home in Winthrop, Mass., on the 7th inst., at the age of 85 years. At the time of the civil war he perfected a steam carriage which was exhibited at various places, bringing him considerable money. Later he devised a steam bicycle, on which he did a mile in 53 seconds in a race against a horse on Long Island.

Another Tangle in the Briarcliff.

Further complications were added to the already well tangled Briarcliff race situation this week by the filing of an application by L. C. Austin for the American Automobile Association with the board of supervisors of Suffolk county for permission to run the 1909 race for the trophy over a course in that county. Representations were made to the solons that the granting of the sanction would result in stimulating business in the vicinity and they appeared to be favorably inclined.

Studebaker MOTOR CARS

If You Can't Get Good Roads Get a Studebaker-Garford Car

GOOD ROADS CARS AND FAIR WEATHER FRIENDS belong to the same category. Both are plentiful. But friends that can be depended upon in times of adversity or cars that can be trusted to take you through regardless of road or weather conditions are, sorry to tell, as scarce as hen's teeth.

STUDEBAKER-GARFORD CARS ARE FAMOUS for rough road performances. Don't hold many boulevard records. What few track records they do hold were made in twenty-four hour grinds—where stamina counts and where dependability wins.

IF YOU WANT A RACING CAR there are many from which to choose. If you are satisfied with a car that will skim along at a mile-a-minute clip over a smooth macadam road—why, their name is legion.

FUNNY, ISN'T IT, what a lot of sales are made on that kind of demonstration. Not one customer in a hundred would be willing to go on a five hundred mile trip such as would really test a car—and show the superiority of Studebaker-Garfords—and yet everyone knows that many times, during the life of a car, it will be called upon to make such a trip and to encounter the worst possible road and weather conditions.

MOST MEN ARE SATISFIED with a little five mile spin or possibly a fifty mile jaunt over picked roads with an occasional refreshing stop at a roadhouse. What does such a demonstration prove as to the stamina of a car or of its riding qualities? Why, the hardest springs ever made won't tire you in a short ride. But on a full day's trip over rough roads—that's where 55 years of experience in carriage-spring making counts. That's where Studebaker-Garford cars excel.

IF WE COULD ONLY INDUCE every prospective customer to take such a ride as we should suggest is necessary to prove the value of any car, we would save a world of money on demonstrations. Each demonstration would be costly—but every one would result in a sale. There would be no waste. But how many prospective buyers would consent to ride all day on such a trip as the Studebaker-Garford "30" is making this week from Denver to Chicago?

BY THE WAY, WHY IS IT that when a newspaper like the Denver Post wants a car for a strenuous five hundred or thousand mile drive; having dozens to choose from—for it's great advertising—why is the Studebaker-Garford always selected? It's easy. Other cars may—may, mind you—accomplish the task. There's one that will with absolute certainty. And, to avoid the chance of a fizzle that car is always chosen. And it's a Studebaker-Garford.

MANY SALES ARE MADE ON THESE TRIPS. It's the practice of our drivers to take along from point to point any persons interested and who are in the market for a car. It's about the only way we can get prospective customers to take what we call a real demonstration. And no one who has ridden a day or more on one of these strenuous trips ever will consider any other car.

A MAN WHO HAD RIDDEN TWO DAYS through Iowa Gumbo on a Studebaker-Garford car gave expression to the phrase with which this ad begins: "If You Can't Get Good Roads, Get a Studebaker-Garford Car." The millennium of good roads is yet a long way off. When it has arrived there won't be such a difference between Studebaker-Garford cars and a lot of others. But while present conditions obtain there's a wonderful difference.

IF YOU ARE IN THE MARKET for an automobile and you want a car that will prove a dependable friend in foul weather as well as in fair; that will afford you comfort on rough roads as well as on city boulevards; and if, before buying, you are willing to take a ride such as we like to lay out to prove the comparative qualities of Studebaker-Garford Cars and others—just say the word.

The Week's Patents.

903,891. Pneumatic Tire. Charles Scheuner, Chicago, Ill. Filed June 12, 1907. Serial No. 378,471.

1. An armored pneumatic tire including a body having a thickened outer portion, provided with an annular recess the side wall of said annular recess having inward extended projections, and an annular armor strip of metal fitting in said recess and having lateral notches engaging said lateral projections, and an annular elastic tread strip fitting upon said armor strip in said recess and having lateral notches engaging said lateral projections.

903,897. Lubricator. Harry A. Sedgwick, Madison, Wis., assignor to Madison-Kipp Lubricator Company, a Corporation. Filed Nov. 23, 1907. Serial No. 403,557.

1. In a pump, a cylinder, a piston working therein free to reciprocate longitudinally and to oscillate about its axis, and provided with a rigid extension, a drive-shaft directly engaging said rigid extension, the engaging surfaces of said extension and shaft being adapted to both reciprocate and oscillate said piston, substantially as set forth.

903,942. Automobile Draft Attachment. Charles J. Zillgitt, Fairmount, N. D. Filed March 10, 1908. Serial No. 420,231.

1. In combination, a ring secured to the drive wheel of an automobile or like machine, a drum provided with hooks to engage with said ring, a clamp acting in conjunction with said hooks to secure the drum to the ring, and a rope or cable co-operating with the drum and adapted to wind thereon to positively move the machine when stalled.

Simplicity

in a typewriter secures durability, ease and efficiency of operation, and increases the speed and accuracy of the work: the

UNDERWOOD

STANDARD
Typewriter

is a Marvel of Simplicify

Yet every part is carefully chosen as the best possible means to the perfect finished product.

There is nothing hidden about the Underwood. The type-bars lying when at rest in a compact segment; the patented guide—all the parts which permit the visible writing—which help, not bother, the operator will be shown you, explained also if you like; but really you'll see for yourself why the Underwood **DOES** endure and why its operation is so easy, quick and accurate.

Firestone SIDE WIRE TIRES

WHY IS IT?

—every representative auto show this season, from the Atlantic to the Pacific has gone on record with an overwhelming majority of Firestone Side-Wire tires as its favorite commercial vehicle equipment,

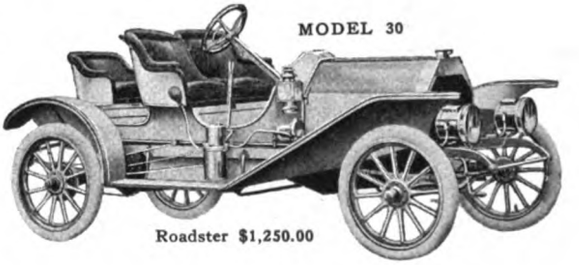
—most of the vehicles now in service have the same tires,

—truck owners who know the vast difference between tire-service and mere tire-talking-points, will have no other.

The answer is found in the unfailing superiority of Firestone tires in the supreme test of actual service.

Firestone Tire & Rubber Co., Akron, Ohio
Branches and Agencies Almost Everywhere.
"The Largest Exclusive Rubber Tire Makers in America."

"THE WORLD'S STANDARD"



"DOES NOT BELIE ITS NAME"

Perhaps the strongest claim that can be advanced on behalf of the Overland is its extraordinary simplicity. This feature does not apply to any one particular part, but to the whole assembly.

The simplicity of our 4-cylinder motor,
The simplicity of our transmission,
The simplicity of our control,
The simplicity of all adjustments,
are not even approached by any other car to-day.

For the new driver the car is ideal. The experienced driver finds that it fulfils his every requirement and that every defect he has hitherto encountered has been taken care of and corrected.

The Warner Auto-Meter

1909 Style

Guaranteed Absolutely Accurate

is the only speed indicator made on the Magnetic Induction principle. Because of the principle it accurately indicates every range of speed from zero to the maximum.

All other instruments are made on the centrifugal principle. They fail to indicate any speed whatever under 5 to 10 miles per hour.

The Auto-Meter is so durably made that practical tests have shown that it will endure a **MILLION MILES** of riding without perceptible wear, or departing from absolute accuracy more than 10 feet to the mile.

We invite comparative tests. Before you decide on any Speed Indicator, put the Auto-Meter on one side of your dash and any other indicator at any price on the other. Then use your watch over a measured course. Keep the instrument which tells the truth. We know which it will be.

They are the Standard of the World

Should be on your Car

The Truffault-Hartford Shock Absorber is not an Accessory

—that's the point we want to emphasize. Say accessory to any well-posted automobilist and he will tell you that if he put every new-fangled idea on HIS car there would not be room for either the motor or the transmission, to say nothing of the passengers. Then say

TRUFFAULT-HARTFORD SHOCK ABSORBER

to this same man, and nine times out of ten he will point to them as a **part** of his car. That's just the difference—that's why we say they are **not** an accessory—but a necessity.

If any proof were needed that these Standard Shock Absorbers should be on your car, just consider that all racing cars—where every additional pound counts—where the car is stripped of everything that is not an essential—where even the frame and other parts of the chassis are bored out to reduce weight—on such cars you will find the Truffault-Hartford Shock Absorber is just as much a part as its axles or springs. Isn't that proof that they are an absolute necessity—an essential?

Then consider that twenty prominent manufacturers make these same Shock Absorbers a part of their Standard Equipment.

Why not write us now, today, telling the make, model and year of your car, and let us arrange to attach a set, or we will send them complete with attachments—you can have the work done yourself in a few hours.

Our little magazine, "Auto-Comfort," is issued monthly. It is full of practical hints and suggestions. Your name on a postal will bring it.

WINTER SUGGESTIONS

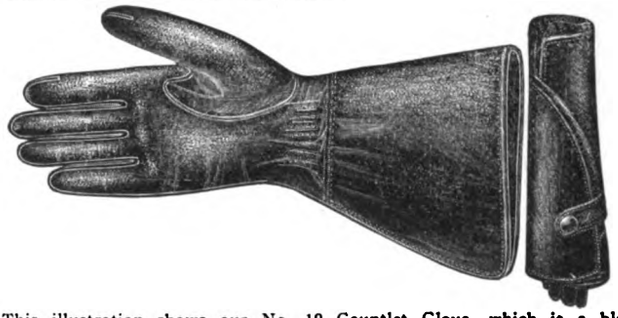
We have a large line of Leather Clothing, Caps, Gloves, Wool Vests, Wool Boots, Ways Mufflers, Storm Coats, Lap Robes, Etc.

ARGYLE AUTO BOOTS

Worn over Shoes for Comfort in Cold Weather Motoring.

The ARGYLE Auto boots are designed to give the motorist's feet complete protection from the elements during winter weather motoring. They are worn over the ordinary shoes and can be pulled on or off very readily. They will keep your feet warm and dry during the longest ride in coldest weather. You cannot realize the comfort they give in frigid weather, till you have worn a pair.

Every man, woman and child who motors in cold weather needs a pair of ARGYLE Auto Boots, no matter whether the time of exposure is a half hour or a whole day.



They are made of fine flexible leather, have strong leather Goodyear welted soles and are warmly lined throughout with genuine lambs-wool.

Made in all sizes, with long or short leg. Length of the long leg is 13½ inches,, and the short 10½ inches.

PRICES:

Long, per pair $9.00
Short, per pair 8.00

NO. 19 AUTOMOBILE GAUNTLET GLOVE

This illustration shows our No. 19 Gauntlet Glove, which is a black, seamless knit lined Automobile Gauntlet with extra large flexible cuff with 2 fastenings. This Gauntlet is made from the best selected imported black cape leather. It has a 7-inch Gauntlet with extra large cuff, 20 inches in circumference, which may be adjusted to smaller sizes. The cuff is lined and is guaranteed not to crack, and is stitched with genuine silk.

It will also be noted from the illustration, that the wrist is fitted with an elastic band, which will keep the Gauntlet tight, and comfortable on the wrist, and prevent it slipping down over the fingers.

The cuff is also flexible, and can be rolled into a small space, as shown in the small illustration, for carrying in the pocket. This is the finest Gauntlet Glove on the market.

Price, seamless knit lined, per pair $3.50

Franklin Car makes perfect score on Timken Roller Bearing and Axle in Bretton Woods Endurance Run.

The 24-hour Bretton Woods Endurance Run of the Bay State Automobile Association, was planned with a view to being so severe as to break the perfect score with which each of the 21 contestants started, in a tour of 369 miles.

Instead of being a 24-hour run of 369 miles, it was a 1,627-mile contest consuming 95 hours, running without adjustment.

Never in the history of automobiling was there a more severe or ability-proving test. The route was the most difficult that could be selected, up steep grades, over roads so rough they required much low gear work, and so dusty as to interfere with the operation of some of the cars.

The Franklin car completed this remarkable run with a perfect score.

The fact that this car was equipped with TIMKEN ROLLER BEARINGS is additional proof that manufacturers realize TIMKEN PRODUCTS are indispensable for getting maximum power and endurance out of their cars.

Write for descriptive literature and special information.

A Word from a Detroit Doctor

that may help you in deciding on your coming season's tire equipment.

Detroit, Dec. 2d, 1908.

"I purchased a Runabout equipped with Morgan & Wright tires and have used it in all my practice, over all kinds of roads in all kinds of weather. Up to date I have covered a little over 13,500 miles, and the treads are still in excellent condition. Not a single puncture, blow-out or tire trouble of any kind in the whole fifteen months' daily service. You may be sure that I will recommend Morgan & Wright tires when opportunity offers to members of my profession and others who desire a tire that can be absolutely depended upon.

Yours truly,
J. H. GRATTON, M. D."

STAND THE TEST

After 27,000 miles continuous service in a Chalmers-Detroit "30," their engineering department reports as follows:

"Examinations of the bearings showed that the wear was remarkably small considering that they had an equivalent of five years' service."

The above simply emphasizes Standard Bearing superiority.

"THE SILENT SELDEN"

$2,000 F. O. B. ROCHESTER, N. Y.

AFTER the remarkable results of our "first year"—the achieved success of 1908, we salute you with real and well established confidence as we introduce the Selden of 1909.

Not only has our promise to produce a high grade car of best materials and workmanship for $2000 been strictly fulfilled, but we have demonstrated the Selden genius in a silent, strong, comfortable, durable and handsome car. It does all that the owner wants to do and all that the chauffeur ought to do. Agents and owners are enthusiastic over it. Not a cheap car at all but one of the how-can-you-do-it-for-the-money kind.

Our 1909 wheel base is lengthened 5 inches from 109 to 114; the magneto and pump moved to left side of motor, the remaining equipment on the right; the brakes enlarged and now rigged inside the frame; the wheels now 34 inches were 32 inches; the radiator and hood made to conform in style to longer wheel base—little touches for style and convenience. No radical mechanical changes, simply because we couldn't find any necessary—no use fooling with what has proved so unusually good.

We can assure those who buy the 1909 Seldens all the efficiency of the 1908 Seldens with a little more style and a little more convenience, a little more refinement. The actual records of use and travel this year have so proven their merit, power and economic stability that it would be hard to promise anything better in practical construction.

THE COMING CAR OF MODERATE PRICE

Up and ready when you want it.

Out of the way next minute.

No screws or nuts to bother with. You put it up and down without taking your hand off the steering-wheel or even slackening the speed of your car.

In cold weather you keep it up all the time.

In middling weather you keep it up when the wind troubles you, and put it down the minute you want to.

In summer you put it up to rest your eyes from the wind, or whenever you pass through a cloud of dust, or marshy country where there are small flies in the air.

No goggles needed; does away with the only discomforts of automobiling.

Besides it is the handsomest and best made of all wind shields.

40-inch size, $35. 44-inch size, $37.50 — complete.

At all dealers. If your dealer can't supply you, send to us and we will ship it direct. Send for book anyway.

Soot-proof Spark Plug

The only spark plug that keeps itself absolutely free from soot. Prevents short-circuiting; does away with most of the ignition troubles.

C. A. MEZGER, Inc., 1629 Broadway, New York

I Want You to Know the Mechanical Principles

upon which are based the success of this car.

When 12,000 satisfied owners are all enthusiastic, there must be something worth your attention in the

"Maxwell"

"The Aristocrat of Moderate Priced Cars."

WHAT ARE THESE MAXWELL PRINCIPLES?

ENGINE AND TRANSMISSION—are built together—cast in one piece. This makes the strongest possible construction with a minimum of weight.

THREE-POINT SUSPENSION—Because the engine and transmission case of the Maxwell are combined in a single casting we are enabled to support the Unit Power Plant from three points—Motor Age (a technical paper) says "nothing could be nearer the truth."

MULTIPLE DISC CLUTCH—Used first by the Maxwell as far back as 1904, this clutch is now universally copied. Automatically lubricated by running in oil—it requires no attention.

STRAIGHT LINE SHAFT DRIVE—A basic Maxwell principle. No chains to break, stretch and wear. Two self-oiling universal joints make this the one perfect method of transmitting power.

THERMO-SYPHON COOLING—The Renault, the acknowledged leading car of France, and the Maxwell are exponents of this idea. A perfect system of water-cooling—minus all complications, namely—the pump and connections.

INDESTRUCTIBLE METAL BODIES that cannot crack, warp, or blister. No wooden body can possibly be as good.

The above are but a few of the Maxwell principles. Our catalogue goes further into details. Every claim made here we prove. That's why I want to send you a copy—now—today.

Benj Briscoe
President.

GROWING

¶We have outgrown our present quarters.

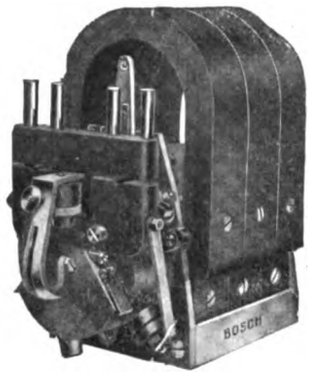
¶To accommodate our steadily increasing business and to give our stocks sufficient show space, we needs must spread out.

¶Accordingly, we have leased, for a long term, the building at 215-217 North Broad Street (the property immediately adjoining our present Philadelphia store), which, after extensive alterations, we will occupy on April 1st.

¶This new building will give us 12,000 feet of floor space for the display of our wares.

¶We invite every reader of the Motor World to call on us in our new quarters and personally inspect our stock. We'll show you lots of new and interesting things.

¶If this is impracticable, let us send you our new 1909 Catalogue. It's a store in itself.



¶Don't forget we are distributing agents for Continental Ready-Flated Tires and Demountable Rims. They are the standard tire equipment.

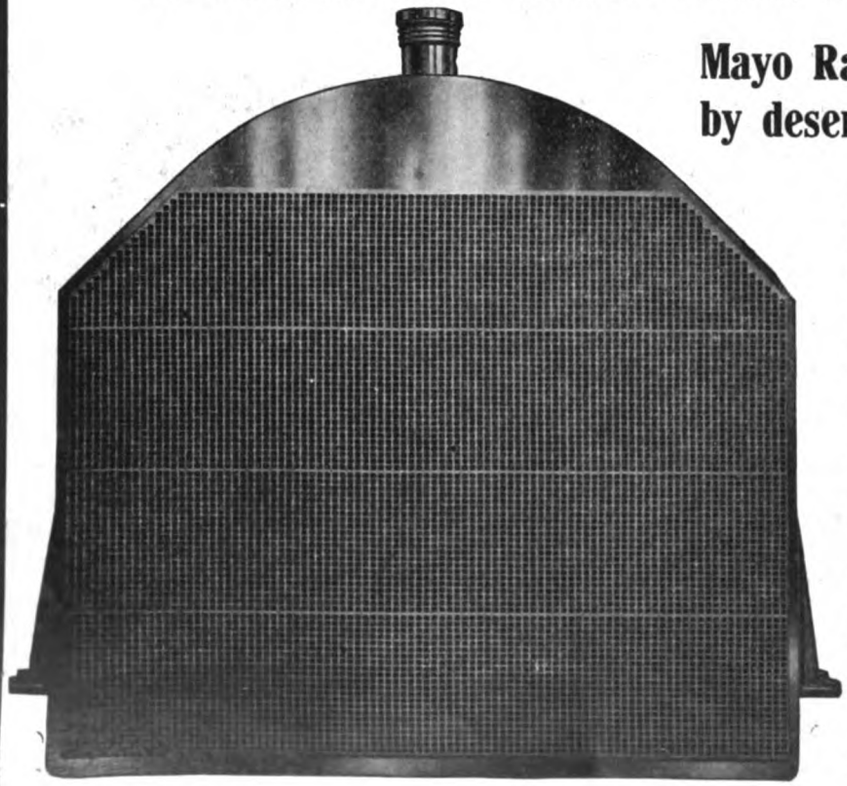
"DOES NOT BELIE ITS NAME"

Perhaps the strongest claim that can be advanced on behalf of the Overland is its extraordinary simplicity. This feature does not apply to any one particular part, but to the whole assembly.

The simplicity of our 4-cylinder motor,
The simplicity of our transmission,
The simplicity of our control,
The simplicity of all adjustments,
are not even approached by any other car to-day.

For the new driver the car is ideal. The experienced driver finds that it fulfils his every requirement and that every defect he has hitherto encountered has been taken care of and corrected.



Write for catalog to

Roadster $1,250.00

OVERLAND AUTOMOBILE COMPANY, Indianapolis, Ind.

'Tis not in mortals to command success, but we'll do more—deserve it.

Mayo Radiators have achieved success by deserving it, and in no other way.

¶ Therefore that success is presumably of the permanent and abiding kind.

¶ Price is the cause of the absence of MAYO RADIATORS from cheap cars.

¶ Quality is the reason for the presence of MAYO RADIATORS on most of the good cars.

¶ The only argument against MAYO RADIATORS is their price.

¶ Every other consideration dictates their use.

¶ MAYO RADIATORS combine sound mechanical principles, exact design, construction and workmanship, together with graceful appearance and perfect finish; in short, all the good qualities that go to make the ideal radiator.

¶ MAYO RADIATORS are stamped with the hallmark of class.

¶ MAYO RADIATORS are really the thoroughbreds of the radiator world.

¶ MAYO RADIATORS are made in the kind of a factory that befits them and by the MAYO RADIATOR COMPANY, at New Haven, Connecticut.

THE BOSTON SHOW

like the New York, Chicago and other representative automobile shows of the year, exhibited more

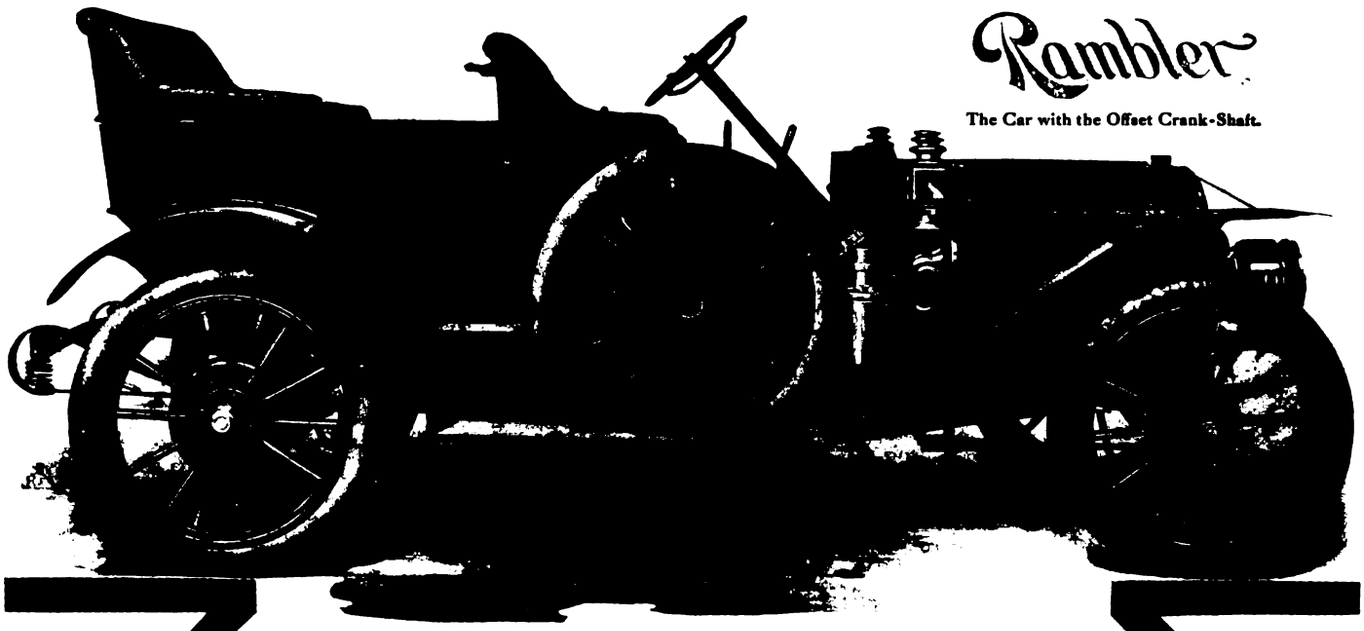
"Firestone"

Non-Skid tires on American cars than any two other non-skids combined.

Firestone tires totaled third in equipment—more evidence of the changing sentiment among motorists against mere popular price in favor of the best possible tire service.

In the commercial vehicle section, the usual preference for tire equipment stood:

27 sets Firestone Side-Wire Tires—the World's Standard.
6 sets next highest make.
3 sets second highest make.
7 sets six other competitors combined.
43 total commercial vehicles exhibited.



The prestige of Firestone tires grows, as the demand for better tire service increases.

Rambler

The Car with the Offset Crank-Shaft.

Model Forty-four, 34 H. P., $2,250.
Spare Wheel, with Inflated Tire, Brackets, and Tools, $74. Magneto, $150.

TRY IT ON THE HILLS

Test this car at half-speed on a hill or sand road where power—and every ounce of it—is needed. Notice how steadily and powerfully it pulls when running slowly under load.

The capacity of the Rambler engine for doing this extra work is most noticeable at low engine speeds. This is because of the Offset Crank-Shaft.

All that power which in other engines is lost through friction on the bearings and cylinder walls is added to the driving force by the Rambler Offset Crank-Shaft. It reduces friction, eliminates hammer on bearings, gives more power. The Straight-Line Drive delivers the power direct and with least frictional loss to the rear axle.

Seven-passenger model, 45 horsepower, with Offset Crank-Shaft, $2,500. Other models, $1,150 to $2,500. A new Rambler catalog has just been issued. It describes and illustrates all distinctive features of new Ramblers—the Offset Crank-Shaft, Spare Wheel, Straight-Line Drive, etc. A copy on request.

THE MOTOR WORLD

Volume XIX. New York, U. S. A., Thursday, March 18, 1909. No. 25

WHEREIN THE INJUNCTION FAILS

Unexpected Refusal of Contempt Order in Rushmore's Suit—Manhattan's "Unfair" Lamps Disposed of Abroad.

How to dispose of goods that infringe the rights of other Americans and that have been rendered unsalable in America by reason of having been "tied up" by an injunction of a United States Court has been pointed out by one of those same tribunals. In brief, the solution of the apparently vexing problem is to ship such goods abroad.

This solution was evolved in the case of Samuel W. Rushmore, of Plainfield, N. J., against the Manhattan Screw & Stamping Co., which just has been decided by Judge Noyes in the United States Circuit Court for the Southern District of New York. It will be recalled that several months ago Rushmore won an action for unfair competition against the New York concern, the unfairness consisting of imitation of the Rushmore "flared front" type of searchlight lamp, the court imposing a fine and issuing a permanent injunction restraining the production and sale of the "unfair" lamps. Despite the injunction, the Manhattan company shipped some of its lamps abroad, learning which Rushmore applied for an order holding the defendants to be in contempt of court, the alleged contempt consisting of violation of the injunction in sending the enjoined goods to Europe. When the case was heard the Manhattan Screw and Stamping Co. proved to the satisfaction of the court that the lamps exported had been manufactured previous to the issuance of the injunction, which Judge Noyes held to be not illegal and he therefore found that no contempt had been committed.

In his decision, Judge Noyes takes account of the fact that the defendant had filed an affidavit showing that none of the lamps covered by the injunction has been manufactured since it was issued; that none of the lamps manufactured before the injunction has been sold in this country since that time; and that some of the lamps manufactured before the injunction was issued have been sold in Europe since that time. These statements the plaintiff, Rushmore, was not in a position to dispute.

"Upon these facts," the court ruled, "the case is brought, in my opinion, within the principles of the decisions in Gould vs. Sessions, 67 Fed. 163, and Bullock vs. Westinghouse, 129 Fed. 105, holding, as I construe them, that an injunction against the infringement of a patent is not violated by the sale of the patented article in countries to which the monopoly does not extend. It is true that in the former case the court referred to the fact that 'no preliminary arrangement for the sale were made in the United States,' but I cannot regard that statement as imposing a limitation upon the doctrine respecting sales in foreign countries. The application to adjudge the defendant in contempt is denied."

Canadian Company to Make Buggies.

The long established Tudhope Carriage Co., Orillia, Ont., Canada, has taken up the motor buggy, a separate company, the Tudhope-McIntyre Co., having been formed for its manufacture. The McIntyre (formerly Kiblinger) engine and other McIntyre parts are being used in its production.

New York Firm will Operate Cabs.

In addition to selling the Stearns car in New York, Wyckoff, Church & Partridge are making ready to operate a taximeter cab service. They have placed an order with the Bristol Engineering Co. for 100 Rockwell cabs which are to be fitted with Hartford tires.

York to Produce Motor Vehicles.

The York Carriage Co., of York, Pa., has decided to engage in motor car manufacture, and has awarded a contract for a brick addition to its plant for the purpose. The product will be chiefly commercial vehicles, which are expected to be on the market in May.

PUNCTURES STORY OF CAB TRUST

President Meade, of New York's Biggest Company, Says Contemplated Merger is Fiction—The Question of Rates.

Because apparently the wish is father to the thought on the part of some men interested in taxicab ventures in New York, reports of an impending or a prospective taxicab trust have been given wide and generous publicity during the past few days. But when President Meade, of the New York Transportation Co., which controls some 800 of the cabs and practically dominates the situation in New York City, was asked by the Motor World how much truth or how much fiction reposed in the reports, he made prompt and unevasive reply:

"The reports are all fiction so far as we are concerned," he said.

The New York Transportation Co. was one of six concerns which were said to be involved in the prospective "trust" and was reported to have been represented at a meeting inspired by H. W. Whipple, at which an agreement to raise the taxicab rates was agreed on as the first move toward the merger.

Mr. Meade stated, however, that the New York Transportation Co. had not raised its rates, nor agreed to raise them, though he added that they ought to be raised. He remarked that there is no uniform rate in effect and that Mr. Whipple's company, a recent entry in the field, which is credited with having raised its rates in conformity with the alleged agreement, had charged the present and higher figure since its beginning.

Fire Destroys Rands's Top Factory.

The factory of the Rands Mfg. Co., Detroit, Mich., makers of automobile tops, etc., was almost totally destroyed by fire on Tuesday last, 15th inst. It was insured for $19,000.

Digitized by Google

In the Retail World.

The Southern Vehicle Co., of New Orleans, La., has added automobiles to its lines. The concern has taken the agency for the Mitchell and the Waverley.

The Leighton Auto Co., of Brockton, Mass., has moved into its large new home at Warren avenue and Bartlett street. The structure is of concrete and brick.

The Adams Electric Co., of Trenton, N. J., has opened a garage on East State street. A repair shop and a department for the sale of supplies have also been installed.

The Benton Automobile Co., of Canon, Colo., has leased the building formerly occupied by the Canon City Automobile Co. A garage business is being conducted.

The Peerless Motor Specialty Co. is the style of a new accessory supply house which has "opened up" at 342 Yonge street, Toronto, Canada. H. B. Sills is the manager of it.

The Smalley Auto Co., Brockton, Mass., of which F. E. Smalley is manager, has leased a garage at 38 Maple avenue. The firm will handle the Pullman, Regal and Glide.

The Erdman Auto Garage Co., 12-20 East Eighth avenue, Denver, Colo., has opened a new brick garage. The establishment includes a repair department and an electric charging station.

The Royal Sales Co. has been formed in Seattle, Wash., to take the agency for Royal Tourist cars. George E. Dickinson is the president, and a location has been taken at 1401-3 Broadway.

William Seufert's new garage in Port Clinton, O., has been completed. It was opened up this month, and boasts a well equipped repair department in addition to the garage feature.

The Queen City Automobile Co., of Cincinnati, O., has taken a new name and will hereafter be known as the Cadillac Motor and Garage Co. The headquarters will be on West Court street.

Chanslor & Lyon, of Los Angeles, one of the first automobile supply firms on the Pacific coast, have removed to 945-947 South Main street. The new location will afford some much needed "elbow room."

P. K. Morcom has entered the automobile business in Denver, Colo., by taking the agency for Firestone motor buggies and light delivery wagons. His salesroom and garage is at 2420 Humboldt street.

The Chicago Motor Car Co. has leased for 99 years the northeast corner of Michigan avenue and Twenty-fourth street, Chicago, and will erect thereon a three-story building that will cost not less than $25,000. The dimensions of the plot are 134 by 60 feet.

Charles P. Root, one-time editor of the Motor Age, who has been handling motor boats and cars at 1806 Michigan avenue, Chicago, is preparing to dip more largely into cars. To that end he has obtained the agency for the National.

A branch in Newark, N. J., for the Stevens-Duryea Automobile Co. has been opened in Halsey street. George F. Eveland, formerly with A. G. Spalding & Co., the New York and Philadelphia representatives for the Stevens-Duryea, has been appointed manager.

The Peoples Automobile Co., Dayton, O., which has been incorporated with $25,000 capital, has taken over the business of the Blank & Lukens Auto Co., and J. Paul Bishop at 19-21 West Second street. Howard K. Wiley will be the manager of the concern which will handle the E-M-F., Thomas and Locomobile cars.

Application for a receiver for the Dayton Auto Exchange, 600 South Wayne avenue, Dayton, O., has been made by Lloyd S. Johnson, in a suit to dissolve the partnership between himself and C. E. Dunn, under which the concern was operated. No estimate is made of the assets or liabilities of the firm.

Alvan T. Fuller, the well known Boston agent, has purchased a large plot of ground on Commonwealth avenue and Gardner street, on which he will construct a large concrete garage and machine shop in which automobile bodies and other things will be built to order. The plot, which comprises 87,000 square feet, is considerably removed from the business center of Boston in which Fuller's salesrooms are located and which latter will not be discontinued when the new place is completed.

Internal dissension in the Missouri Valley Automobile Co., of Kansas City, has led the president, Harvey E. Rooklidge, to apply for the appointment of a receiver and the winding up of the business. Rooklidge, who holds one-third of the capital stock of $15,000, alleges that on February 26th last, the other stockholders took forcible possession of the company's property and have since refused to recognize him as president. He states that the company's liabilities amount to $30,000 and that though he was informed that the capital stock was fully paid up when he bought his one-third interest, he since has discovered that such was not the case.

Due to the report published in the Motor World that the Springfield Automobile Co., Springfield, Mass., was removing to Springfield, Ill., the Springfield Automobile Co., of which F. G. Jager is president, and which handles the Stevens-Duryea, Locomobile and Babcock, write that an erroneous impression has been crreated. Mr. Jager claims that his company is entitled to the use of the name and adds that previously it has been so much annoyed by its employment by the concern that manufactured the Springfield car, to which the removal notice referred, that their (the Jager) attorney has notified the makers of the car to discontinue the use of the name as their company title.

The Week's Incorporations.

Cleveland, O.—Cleveland Taxicab Co., under Ohio laws. Increase of capital from $25,000 to $150,000.

Austin, Tex.—Austin Motor Car Co., under Texas laws, with $5,000 capital. Corporators—W. W. Pitts, John R. Blocker and P. R. Schwinge.

Hartford, Conn.—Universal Auto Repair Co., The, under Connecticut laws, with $3,000 capital. Corporators—Herbert R. Seymour, James P. Grady and John F. Daly.

Syracuse, N. Y.—Wonder Mfg. Co., The under New York laws, with $40,000 capital; to manufacture automobiles, etc. Corporators—W. D. Boyle, G. T. Hurd and B. C. Cornwell.

Boston, Mass.—South End Motor Car Co., under Massachusetts laws, with $30,000 capital; general automobile business. Corporators—R. G. Irwin, president; F. M. Durkee, treasurer.

Cheyenne, Wyo.—Cheyenne Automobile and Supply Co., under Wyoming laws, with $5,000 capital; general automobile business. Corporators—L. E. Smith, T. C. Armstrong, and M. H. Hartung.

New York City, N. Y.—Connecticut Motor Vehicle Co., under New York laws, with $50,000 capital; to manufacture motors and vehicles. Corporators—C. M. Gilpin, H. A. Stuart and H. C. Murray.

Los Angeles, Cal.—Pioneer Automobile Exchange, under California laws, with $25,000 capital. Corporators—Edwin W. Walker, John W. Mitchell, Frank E. Edwards, Henry F. Duck, and Robert E. Moir.

New York City, N. Y.—Rainier Motor Co., under New York laws, with $350,000 capital; to manufacture vehicles propelled by power. Corporators—P. N. Lineberger, G. C. Comstock and F. H. Van Houton.

New York City, N. Y.—Monarch Motor Co., under New York laws, with $25,000 capital; to operate cars for hire. Corporators—A. C. Rader, E. H. Fritchman, Montclair, N. J.; F. J. Griffin, New York City.

Nashville, Tenn.—Tennessee Automobile Co., of Hamilton County, under Tennessee laws, with $10,000 capital. Corporators—H. Blacklock, R. A. Brantley, E. G. Huffacker, Jeptha Bright and G. H. Blacklock.

Providence, R. I.—Driving Club Stable, The, under Rhode Island laws, with $100,000 capital; to do a garage and general automobile business. Corporators—John W. Page, Milton W. Mason and Stephen L. Tingley.

Louisville, Ky.—Weber Auto-Truck Mfg. Co., The, under Kentucky laws, with $10,000 capital; to manufacture gasolene and electric trucks. Corporators—Frank Weber, Edward J. Weber and J. L. McBurnie, Jr.

Chicago, Ill.—Adams Automobile Co., under Illinois laws, with $5,000 capital; publishing and manufacturing business and to conduct automobile school. Corporators—M. P. Morissey, J. H. Dunn and J. M. Tyrrell.

UNIT COIL BUYS MORE PATENTS

Four Added to the Two Already Owned—Rights That Are Secured by the New Acquisitions.

Being already possessed of the Varley and Williams patents, Nos. 878,435 and 884,116, both of which were applied for in 1904 and issued in 1908 and which are claimed to cover the now universal unit coil construction, the Unit Coil Co., 34 Jersey City, has further strengthened its position by the purchase of four other patents bearing on the situation.

The latter rights are those covered by the Brigham and Lawton patents on coils and the Miller and Dow patents which are claimed to control the basic rights to master vibrators.

The Lawton patent, No. 911,414, applied for in 1907 and issued last month, and the Brigham patent apply to multiple cylinder ignition with an ignition device for each cylinder and a coil for each device, and means for bringing the ignition devices into successive operation for preventing interference between the coils to prevent cross firing. The Miller patent, No. 754,666, granted March 15, 1904, substantially covers the combination of two or more coils, a circuit breaker and a multiple-switch controlling the primaries of the coils and an interrupter and its controlling magnet in series with the primaries of the coils. The Dow patent, No. 752,384, issued February 16, 1904, describes apparatus including a plurality of coils, a sparking device for each coil, a source of energy, a single vibrator and condenser, a separate circuit for each coil, an interrupter for each circuit, means for operating the interrupter dissimultaneously and means for impressing on each circuit a condenser discharge.

Imperial Wheel Denies Absorption.

Although it had been understood that the Imperial Wheel Co., of Flint, Mich., was so closely allied with the Dort-Durant and Buick interests as to be connected with or influenced by the $12,500,000 General Motors Co., of which Buick is the mainspring, J. D. Dort, president of the Imperial Wheel Co., wires that the report to that effect published in last week's Motor World is untrue. He asks politely that the denial be published and, of course, this is cheerfully done, the Dort denial adding but one more to the long list of denials that have been brought out since the more or less mysterious General Motors merger first was conceived. The prospectus of the merger exploiting its stock which was printed exclusively in the Motor World last week was the first really authentic information regarding it that has been obtainable. But now that the "secret" is out and invited guests have been admitted to the ground floor, it is stated that the beauties of the merger and its wares are shortly to be exploited by some spreadeagle advertising, the campaign having been entrusted to a corps of experts.

New York Car and Truck Schedule.

Schedules in bankruptcy of the New York Car & Truck Co., of Kingston, N. Y., were filed last week. The company, of which Orlando F. Thomas, of New York, was president, was at one time engaged in the manufacture of the Allen-Kingston car under contract, and became involved in litigation because of alleged failure to make deliveries in accordance with its agreement, following which receivership proceedings were brought. The schedules show liabilities $496,580, of which $309,603 are secured, $7,171 for taxes and $2,829 wages, and nominal assets $2,821,742, consisting of factory property and plant, $2,500,000, actual value unknown, mortgaged for $308,000; stock, $86,558, accounts $11,885, notes $2,450, cash in bank $724, office furniture $125, and shares of stock in other corporations $220,000.

Bankrupt Charged with Concealing Assets.

Charles L. Cohn has been appointed receiver for the Pneu L'Electric Co., New York, who imported some tires and sold some wind shields and against whom a petition in bankruptcy was filed on February 24th last. At that time a receiver was not asked for, but it now is alleged that prior to the bankruptcy proceedings the greater part of the assets were secreted. The schedules of the company show liabilities of $31,338 and nominal assets of $12,856, consisting of stock, $3,000; accounts, $9,082, and cash, $774. Among the creditors are William H. Cowan and D. B. Mitchell $14,423; David B. Mitchell, $2,496; George Leveene, $6,500; John Quinlan, $2,023 and the Class Journal Co., $1,940.

Rainier Once More in Motion.

Having completed reorganization and having reincorporated as the Rainier Motor Co., John T. Rainier and his associates have acquired from the receiver all rights, titles, etc., to the assets of the Rainier Motor Car Co., and have resumed operations. Mr. Rainier is president and Paul N. Lineberger, vice-president of the new company, which has started moving the wheels in the factory at Saginaw, Mich., and also leased the building on the northeast corner of Broadway and Sixty-fourth street for New York headquarters. It is expected that the new Rainier model will reach New York next week.

Seward Joins Michelin Sales Staff.

William Seward, Jr., formerly with the Hartford Rubber Works and latterly of the Seward Rubber Co., has joined the staff of the Michelin Tire Co. He will be attached to the general sales department.

The Gabriel Horn Mfg. Co. has opened a New York branch at 1796 Broadway.

NO CHANGE IN IMPORT DUTIES

Revised Tariff Lists Both Cars and Tires at Existing Rates—Patent Situation Given New Turn.

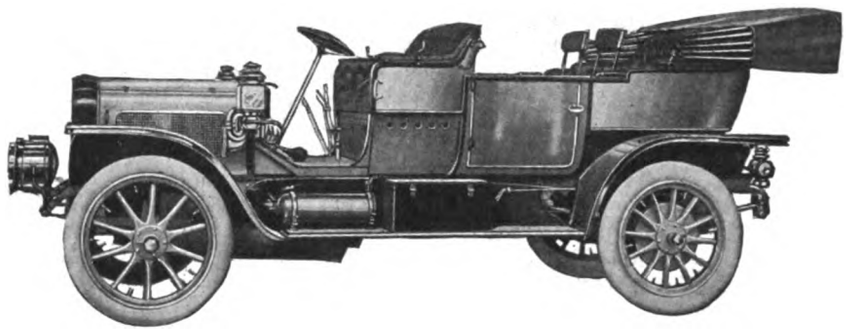
Despite the more or less—about 99 per cent. less—remarkable philanthrophy of the Flint (Mich.) manufacturer engaged in floating a $12,000,000 holding company—which has stock for sale—who hired a lawyer and who himself later appeared before the Ways and Means Committee to second the efforts of the importers to obtain a reduction in the import duty on automobiles, the Congressional committee has done nothing of the sort.

The revised tariff, which was introduced yesterday into Congress keeps automobiles and parts thereof exactly where they were before—at a duty of 45 per cent. ad valorem. Heretofore they were classed as "manufactured steel not otherwise specified," but in the new tariff they are specifically listed. Tires also remain at 30 per cent.

It is thought possible that the dejection of the Flint manufacturer at the plight of his co-laborers, the importers, is of the sort that will require him to stuff a handkerchief in his mouth to conceal his feelings.

It cannot be said that the action of the Ways and Means Committee causes any surprise. It had come to be reasonably well understood that the practically unanimous plea of the American trade that the duty be left unchanged would be heeded.

The most surprising feature of the new tariff is the unexpected notice which it serves on England, France and Germany that two can play at the game of nullifying patents granted to non-residents unless the articles so patented actually are manufactured in the country issuing the supposed protective grant. The section in the new tariff covering this point applies the same rules to patents obtained in the United States by aliens that are adopted by the country of which these aliens are citizens in respect to patents issued there to citizens of the United States. This will compel foreigners obtaining patents in the United States to manufacture here or forfeit the rights to their patents.



Alleges Infringement of Goodyear Rim.

Suit alleging patent infringement has been brought against the Standard Universal Rim Co., of Columbus, O., by F. A. Seiberling, president of the Goodyear Tire & Rubber Co., of Akron, O. In the complaint, which has been filed in the United States Circuit Court, for the Eastern Division of the Southern District of Ohio, it is claimed that the Standard company is producing a rim which incorporates some important features of the Goodyear quick detachable rim that are covered by the patent rights of the plaintiff.

THE WHITE STEAMER

Is the Most Desirable Car

The White Steamer has many desirable qualities not possessed by any other automobile. It is the only car which is noiseless, odorless, smokeless and free from vibration. It is the only car which can be driven at any speed without the shifting of gears. For these reasons the passengers in a White enjoy a degree of comfort not obtainable in any other type of car.

The superiority of the White in these respects was well summed up in the following official report by the Quartermaster-General of the United States Army:

> "The White is simple in operation. The means of propulsion being steam, it is better suited for the transportation of the sick and wounded than gasolene cars on account of its free and smooth running, freedom from violent vibration and ease of controlling the speed between maximum and minimum without jerks or jolts."

These considerations, which influenced the War Department (and later the Navy Department) to adopt the White exclusively for motor ambulance work, should incline the private purchaser, who values simplicity and comfort, toward the White.

The White has an unequaled record for supreme reliability and for low cost of up-keep, and anyone who purchases a car without at least investigating the White is acting with only a partial understanding of present-day attainments in the construction of automobiles.

We make two models—a 20 horse-power car at $2000 and a 40 horse-power car at $4000 (shown above).

Cable Address, "MOTORWORLD," NEW YORK.

Entered as second-class matter at the New York Post Office, November, 1900.

NEW YORK, MARCH 18, 1909.

"Up to about a year ago I subscribed for five or six different automobile trade publications, including the Motor World, but now I take only one—the Motor World—as I find that it covers not only everything all the trade journals print, but especially on the first three pages presents such news as none of the other papers even seem able to get. There is no doubt that the Motor World is by far the most up-to-date purely automobile trade paper printed."—H. J. Koehler, S. G. Co., New York, by H. J. Koehler, president.

Adaptation of Methods to Markets.

It must be something of a cross to some manufacturers who are branching out into foreign fields to learn that they must change their methods to suit the territory. Branching out into foreign business is like branching out into a new territory at home, in this one respect, that in order to succeed, both the product and the manner in which it is displayed must be such as to appeal to the local inhabitants. Only, in branching out into a new state in the Union, the differences in local conditions are so slight as to appear almost negligible. All the same the work of handling a new domestic territory commonly is placed in the hands of a local man whose methods of approach where successful are so in a measure proportionate to his understanding of local necessities as well as his ability as a salesman. So in the foreign field, the buying class must be approached on an even footing of language and business custom.

Perhaps this necessity assumes no graver character than in the matter of trade literature. To the average manufacturer cataloging appears somewhat in the light of a burden at all times. But the idea that foreign catalogs must be presented not merely in the form of translations, but rewritten completely, in order to appeal to the readers' minds is not easy to assimilate. No matter in what light it is regarded the cataloging outlay always is a heavy one, from which it is difficult to trace direct results. Yet as the average catalog is quite as much a reason-why argument as a mere listing of qualities and specifications, it is important that the reasons and the reasoning be such as to appeal to the reader. In this respect it is important that no foreign selling campaign be undertaken under the mistaken impression that the introduction of foreign products against local competition can be handled simultaneously with a conversion of local methods to those obtaining in the locality from which the product originates. Competitions are based on the rivalry of equivalents or apparent equivalents, and no business competition can be waged successfully in the face of an attempted reform which seeks to overthrow one of the pillars of the social fabric of any land as strong as that of business tradition.

Breaking Down of Trade Prejudices.

Indications continue to point to a condition of extreme anxiety on the part of those who are engaged in the carriage trade to cultivate the automobile field in some of its many branches. From the numbers of old-line carriage makers who are at present engaged in the production either of automobile bodies or else the assemblage in one guise or another of the high-wheeled type of motor vehicle, down through the line to the small retailers who are eagerly grasping the opportunity of getting into the business of motor vehicle selling by establishing agencies merely as side lines, a continual and growing movement is manifest which marks an equally persistent dissolution of the lines of demarcation between the two industries which used to be so ruggedly maintained. Further than that, it is observable that the accepted organs of the carriage trade, the vehicle and implement journals, are equally astute in cultivating the business.

Back of this general acknowledgment of the importance of the motor vehicle movement is found more than a slow breaking down of the barrier of prejudice which formerly was so strong. It is no longer possible to conceal the fact that the carriage trade is in a very bad way and that it is welcoming the possibilities of income derivable from the automobile not simply as a result of a growing breadth of appreciation, but also because it helps to divert to fast emptying coffers a welcome dollar now and then. Incidents are not wanting of expensive and beautifully made carriages being sold at ridiculously incommensurate prices merely to clear them off the floors where they have stood until their sales value is threatened because of their shopworn appearance; of speculators buying vehicles at bargain prices in large lots and shipping them to distant points on the chance of anticipating the spread of the automobile movement, only to find that they are too late; of stocks which have been on hand so long that their owners are beginning to despair of ever being able to move them.

Incidentally the enrollment of the carriage trade in the marketing end of the automobile business involves an important bit of education for a large number of the class. Accustomed to a relatively small but constant flow of business practically throughout the year, and to long credits, they come into the automobile field with an idea that they can buy at any time from the manufacturers, renew their purchases when they please, and generally throw the burden of stock carrying on the maker himself. Instead, they are faced with the, to them, astonishing proposition that they must be content with a relatively small allotment for the first year because the maker's stock already is low, although active trading at retail has not even begun to a noticeable amount; and further, that if they really want to share in the profits of the automobile business, they must come around early in the fall with definite plans for the assumption of a liberal allotment, for the following year, which they must accept on the maker's own terms and under conditions of the most rigorous nature.

Digitized by Google

As a class the carriage trade embodies a clean, wholesome, business-like group of men, well schooled in the lore of their line and in many cases, born and bred to it. Once learning the novel conditions to be encompassed in the handling of motor vehicles, they are likely to prove a useful and independent contingent and therefore a welcome addition to the forces at work in the industry. At the same time, such are their methods in some instances and so poor their grasp of the swift-moving progress of the industry that it is inevitable that some of them should fall victims to the very novelty of the conditions under which they are called upon to work. Others are likely to develop into a strong and useful addition to the automobile dealers' ranks and to those of the makers, as indeed some already have done.

Wierd Effect of the Boston Show.

Until The Automobile of last week made its appearance, it is reasonably certain that none of the exhibitors and not even the management of the Boston show thoroughly realized how terribly profound and how marvellously mouthfilling is that function, or what a peculiar niche it occupies. But thanks to the intensified vibrations of a three cycle brain possessed by the Automobile, the status of the Boston show now is fixed for all time and in words so exquisitely opaque that not even a Fiji Islander or a babe in arms can fail of quick understanding and rounded appreciation. List to this charming flow of lumpid description:

Pyramided superiority is the summation of the increments for quality, eked out of all the cars, but the height of the pyramid, and its nice proportions, gained immensely at the Boston show, due to the presence of cars of splendid promise, exhibited for the first time, braving the metropolis of the sagaciously conservative, at small risk of adverse criticism, due to the enlightened state of automobile designing on the one hand, and the profusion of superior materials to be had for the asking. . . . . It was regarded as distinctly elevating to go into the Boston show for no other purpose than to critically examine the newcomers, basking in the sunlight of conservative features, strong with good materials and bristling with that formidable array of armament, beaten into form sublime in the smithy of simplicity, launched in a sea of art.

If The Automobile now will but set that stuff to music and require its other half, the Motor Age, to sing or to whistle it. the summation of the increments will not have been performed in vain.

BROOKLYN DEALERS OPPOSE SHOW

Hockey Promoters Scent a Good Thing and Secure Local Club's "Sanction"—But the Trade Says Nay.

As the skating and hockey seasons have about spent themselves, C. H. Green and E. J. Rowe, who are said to be the lessees of the Clermont Rink in Brooklyn, N. Y., have hit upon an automobile show as being a good magnet with which to attract 50 cents pieces from the purses of Brooklyn folk. Accordingly they have programmed a show for the week April 10-17, inclusive, which according to a neat prospectus, they have issued, has been "sanctioned by the Long Island Automobile Club," and will be "the most beautiful automobile show ever held in America." Fifty-six spaces have been laid out in the rink, the prices ranging from $110 to $300, which would net a tidy income to say nothing of the gate receipts. Green and Rowe figure as managers of the show and as the "honorary committee of the Long Island Automobile Club," a goodly part of the membership roll is employed.

Because of its "sanction," the Long Island club is supposed to be due to obtain a "rake-off," but despite the fact the Brooklyn trade is not likely to stand for the plucking. Eighteen of the local dealers have jointly expressed their disapproval and will have nothing to do with the affair.

Thomas and Houpt Fix Date for Parting.

The E. R. Thomas Motor Co.'s New York branch, which as the Motor World stated in December last would be established with W. B. Hurlburt as manager, will be established April 1 in the store at Broadway and Sixty-third street, now occupied by the Harry S. Houpt Co., the Thomas agents. On that date the Houpt company will take over Mr. Houpt's interest in the Herreshoff and Houpt cars and will remove to Broadway and Sixty-eighth street.

Fellwock Buys a Larger Factory.

The Fellwock Automobile & Manufacturing Co., Detroit, Mich., has purchased the factory at Harriett and Virginia streets, in that city, which now is occupied by the Schelosky Table Mfg. Co. and will take possession about August 1st next. The purchase will permit of a large increase of production of Fellwock wind shields and other accessories.

Organized to Improve Electric Service.

The Electric Vehicle and Central Station Association is the style of an organization which grew out of a dinner during the Boston show given, it is said, by the promoter of a new publication to be devoted to those interests which is due shortly to make its appearance. The officers chosen are as follows: President, Frank J. Stone; secretary, H. F. Sands; treasurer, L. R. Wallis; executive committee, Day Baker, Col. E. W. M. Bailey, S. G. Thompson, A. C. Gray, A. F. Neale, J. H. Neal, E. C. Manson, C. B. Davis and N. T. Wilcox. The idea, it is said, is to bring more sharply to the attention of the central charging stations the advantages and profits which may accrue not merely from the charging of electric automobiles, but from their sales and care and repair.

COMING EVENTS

March 13-20, Minneapolis, Minn.—Minneapolis Automobile Show Association's show, National Guard Armory.

March 15-20, Rochester, N. Y.—Rochester Automobile Dealers Association's show, Convention Hall.

March 16, 17, 18, Chattanooga, Tenn.—Three days race meet and hill climb on Lookout Mountain.

March 17, 18, 19, Pittsburg, Pa.—Three days' endurance run.

March 22-27, Toledo, O.—Toledo Automobile Dealers Association's automobile show.

March 23-26, Daytona, Fla.—The Motor Contest Association's (Inc.) seventh annual international races, Daytona Beach.

March 24-27, Syracuse, N. Y.—Syracuse Automobile Dealers Association's first annual show, New York State armory.

March 25, 26, 27, Logansport, Ind.—Automobile show, old rink.

March 27, Atlanta, Ga.—Fulton County Automobile Club's third annual hill-climb, Stewart's hill.

March 27-April 3, Pittsburg, Pa.—Automobile Dealers Association's show, Duquesne Garden.

April 10, New York City—New York Automobile Trade Association's second semi-annual hill climb on Fort George hill.

April 15-17, Louisville, Ky.—Louisville Automobile Association's show, Coliseum.

May 18, 19, Norristown, Pa.—Norristown Automobile Club's endurance run, to Hagerstown, Md., and return.

May 19-22, Philadelphia, Pa.—Quaker City Motor Club's endurance contest, Philadelphia-Pittsburg and return.

Ajax-Grieb Men in New Positions.

H. M. De Silva, who for several years has represented the Ajax-Grieb Rubber Co. "on the road," has been appointed manager of the Ajax branch in Chicago, and L. B. Smith, who formerly had charge of the New York branch, has been succeeded by Joseph S. Gibbs. Smith, however, still remains in the Ajax-Grieb service; hereafter he will travel New York and Connecticut.

ENDURANCE RUN A SCORCHING RACE

Fourteen Perfect Scores in New York-Boston Contest—Speed Laws Violated and One Fatality Results.

By the graciousness of policemen, constables, and others concerned in the enforcement of the speed laws of New York, Connecticut and Massachusetts, the misnamed "endurance run" between New York City and Boston on Thursday last, 11th inst., was allowed to finish. Had the guardians of the public safety done their duty as laid down by State legislation every contestant that finished the scorch would have been disqualified. The rules would not have permitted otherwise.

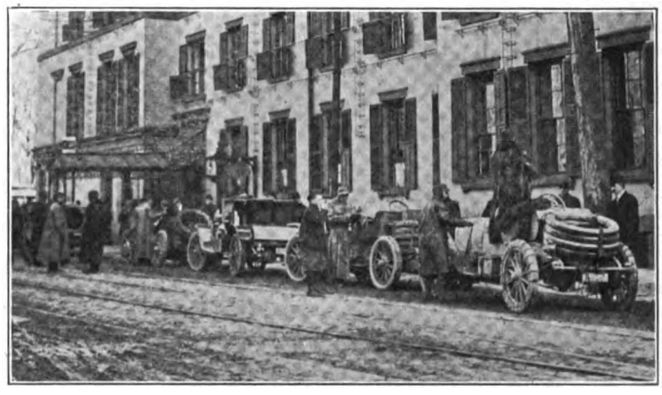
Of the twenty starters that left Columbus Circle, New York City, at one minute intervals, beginning at 6.30 a. m., 17 finished in front of the Mechanics Building in Boston the same night, and of that number 14 received perfect scores, as follows: W. W. Burke, Mora; A. D. Cordner, Acme; A. D. Hall, Matheson; C. S. Carris, Franklin; Guy Vaughn, Stearns; Arthur Dennison, Knox; V. P. Pisani, Zust; Ray McNamara, Premier; M. W. Batts, Stearns; C. S. Rothfuss, Matheson; L. R. Burns, Cadillac; J. I. Miller, Cleveland; H. A. Street, Cadillac, and C. W. Kelsey, Maxwell.

The "endurance run," or more properly the unholy scorch for the Chester I. Campbell trophy was arranged so that it was absolutely impossible for a contestant to follow the rules and at the same time not break any State laws. The schedule called for a minimum of 20 miles an hour and a driver was penalized one point for each minute late in checking into a station. No penalization was given for arriving ahead of time except that a contestant could not check in until the proper time, but late arrivals were penalized in proportion to their tardiness. The result was that every contestant had to maintain a speed of 30, 40 or even 50 miles at times to keep up with the schedule. The rule was that the arrest of any contestant for exceeding the speed limits would result in disqualification. Through the generousness of the police, therefore, 14 cars were enabled to finish with "clean scores."

Few figures as to the times made by the contestants between the various controls are obtainable, but it is stated that one driver reached New Haven 1 hour 14 minutes ahead of schedule, Hartford 39 minutes, Worcester 58 minutes, and Boston 35 minutes ahead. The minimum time allowed by law, was as follows: New Haven 80 miles, 4 hours; Hartford, 42 miles, 2 hours 6 minutes; Worcester, 79 miles, 3 hours 57 minutes; Boston, 44 miles, 2 hours 6 minutes.

All of the drivers were on time at New Haven with the exception of C. H. Beecher, whose car carried the unlucky number "13." Considerable mud, of the deep, sticky yellow variety, was encountered between New Haven and Hartford, but despite the heavy going 18 of the contestants reached that city without mishap, the absentees being Fred Dickinson and W. S. Cox. From Hartford to Worcester was comparatively easy riding, but the bad roads between the latter city and Boston were responsible for the dropping of several perfect scores. More than 100 points were dropped in the stretch of 40 miles.

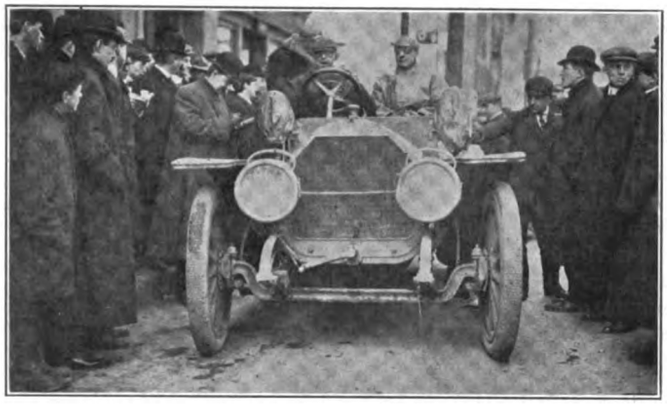
Those drivers who failed to receive "perfect scores" apparently had good reason for it. W. E. Shuttleworth, who lost 6 points in the Haynes, explained that he had lost the road between New Haven and Hartford. Dickinson in the Kisselkar incurred his penalty through skidding into a curb and putting his car temporarily out of the running; he was assessed 165 points. W. E. Force, Lozier, lost two points for being late in checking at Worcester, but he protested, claiming that he was unable to reach the checker in time because of the congestion of cars at that point. Lacroix lost 16 points because of being detained at New Haven, and W. S. Cox, Coates-Goshen lost 50 points for being late after running into a stone wall outside of Worcester. C. H. Beecher, in the Atlas, was taxed 200 points, for being late at controls.



The scorch was attended by one fatality, and that occurred before the cars reached New Haven, the first checking station. The reports of the accident are varied, but a condensation of them shows that A. W. Wallace, a business man of Bridgeport, was killed while driving between Bridgeport and Fairfield. Wallace was in a closed coupe, the team being in charge of a coachman, and Wallace is supposed to have fallen out of the carriage when the horses, it is alleged, became frightened at the automobiles. The coachman did not know his employer was not in the coupe. The local authorities got busy and by some unknown astuteness they decided that Paul Lacroix had been responsible for the accident. Lacroix was apprehended at New Haven, and although he denied all knowledge of the affair, he was held in bail on four counts for his appearance in Fairchild, New Haven, Bridgeport and Stratford. Then he was allowed to proceed on his journey, but he lost his perfect score because of the delay.

The last leg of the course brought another mishap, but not to any of the contestants. E. P. Blake, together with two companions, started from Boston to meet the contestants. They met the scorching cavalcade at Worcester and turned around to accompany them into the Hub. Near Marlboro the car was overturned and Blake and his companions were thrown out, the former injuring his back to such an extent that C. W. Kelsey in the contesting Maxwell, took him to the Marlboro hospital. The others escaped with slight bruises. It was fortunate that there were not several more mishaps.

Lacroix was charged with refusing to stop when signaled at Stratford, of reckless driving in New Haven, of causing the accident at Fairfield, and of mutilating an American flag at Bridgeport. Lacroix was promptly cleared of the Stratford and New Haven charges and, on Monday was freed from all blame by the courts of both Bridgeport and Fairfield. In the morning he was given a hearing in the former city, on the charge relative to the flag mutilation and in the examination it was brought



IN A TRAFFIC JAM AT NEW HAVEN

CHECKING IN AT NEW HAVEN CONTROL

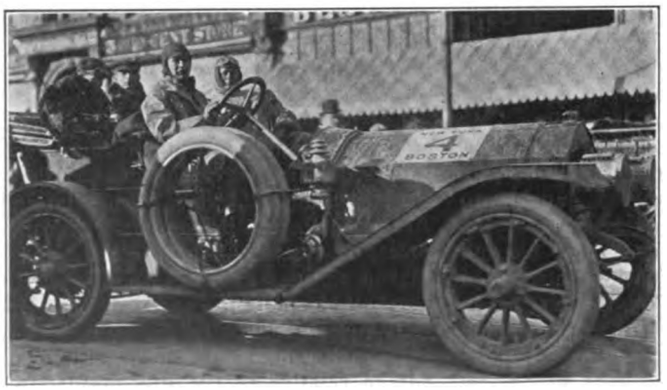
C. S. CARRIS, FRANKLIN, AT NEW HAVEN

out that none of the police was in uniform; that the flag was not unfurled, and consequently there was no way in which Lacroix could distinguish it from a piece of red bunting. After hearing the testimony Judge Carl Foster immediately found the defendant not guilty.



In the afternoon Lacroix was given a trial before Justice Bacon Wakeman in Fairfield. He was not represented by counsel. As soon as the court opened Grand Juror Clintus H. King, who acted as prosecutor, said that he had examined the witnesses privately and was satisfied that no blame could be attached to him, and therefore in the absence of counsel for the defendant would move that he be adjudged not guilty. The judge allowed the motion and Lacroix was completely exonerated.

Following the legal difficulties in Connecticut and the penalization consequent to the delay which was incident thereto, Paul Lacroix, who was held as responsible for the death of a local resident along the route of the New York to Boston scorch, filed a protest with L. M. Bradley, referee of the affair in an effort to have the 16 points which were charged against him quashed. After duly considering the protest, however, Bradley decided that the penalization must stand, arguing very justly that as the entry blank specifically provided penalties for tardiness at controls, and as the applicant admitted in his protest that he was tardy, he has no recourse but to accept the penalty. Bradley further indicates that the fact that the applicant, Lacroix, was discharged by the various courts has no bearing on the matter, save, that had he been convicted, he would have been disqualified outright by that provision of the rules which made violation of the speed law punishable in that way. That other contestants who, by their very records are shown to have merited disqualification on the same ground are permitted to escape disqualification only because they were not arrested and taken into court is not stated, though the inference is plain.

That any violation of Massachusetts law occurring during the race will not be suffered to go unpunished is made plain by a letter sent to Manager Campbell by the highway commission on the 13th inst. It states that the commission is investigating the matter and adds that "it will consider it sufficient cause for the suspension or revocation of any operator's license, and the suspension or revocation of any owner's or dealer's registration certificate whenever it ascertains that such operator, owner or dealer or their automobile or automobiles were involved in reckless operation or gross violation of the speed laws."

NEW ATTACK ON NEW JERSEY LAW

Issue Raised on Constitutionality of License Fees—Points Involving Freedom of Inter-State Traffic.

In a fresh attack on the constitutionality of the New Jersey automobile law, directed in concert by Charles Thaddeus Terry, John W. Griggs and John W. Harding, there has been raised the point which it seems should long ago have been raised, i. e., that the law does not constitute equal and exact justice and conflicts with the Constitution of the United States in that it abridges the right and privileges of citizenship guaranteed by that instrument.

The nominal complaint in the case upon which the trio of learned counsellors are engaged is Frank J. Kane, of New York, who was arrested in Paterson because, while his automobile carried a properly registered New York license, it did not carry a New Jersey registry. He has appealed the decision and fine which was imposed on him.

These points are made in the brief, which has been filed in the New Jersey Supreme Court:

1. The license fees exacted from owners of automobiles by the act of 1908 are not limited to the cost of registration and inspection, but exceed that cost to an extent so large as to require the court to determine judicially that they are intended as revenue measures.

2. These fees are a tax upon property, and as such are not laid in accordance with the requirements of the Constitution of New Jersey upon the true value of vehicles, but are arbitrarily fixed upon the basis of horse power capacity; hence they are illegal against all persons, whether residents or non-residents.

3. This tax cannot be supported as a privilege tax.

4. If the court shall be of the opinion that these license fees as revenue measures are valid as against residents of New Jersey, they are invalid with respect to citizens of other States because they conflict with the provisions of the Constitution of the United States; (a) They are a burden upon inter-State commerce; (b) they abridge the privileges of citizens of the United States; (c) they require as a condition of granting a license that citizens of other States shall authorize an agent in New Jersey to accept service of process in suits brought against such licensees, thereby further abridging their privileges as citizens of the United States, and denying to them the equal protection of the laws by discriminating against them in respect to such suits, in favor of residents of New Jersey.

5 Considerations of inter-State comity should induce the court so to construe this law, if it is reasonably possible to do so, as not to place the stamp of judicial approval upon an act which works unjustly and not inequitably upon citizens of sister States.

In support of the point covering the privilege tax, the brief discriminates between the natural rights of persons and the rights of corporations, which latter rights exist by virtue only of franchises. "The right of a citizen of another State to enter the territory of New Jersey," it contends, "and travel upon the public highways is not a privilege which can be either granted or withheld by New Jersey. The right subsists irrespective of the will or pleasure of the legislature of New Jersey. It is founded on the guarantee of free intercourse between the States. It is one of the privileges of citizens of the United States which the States are forbidden to impair."

To support the fifth point there is quoted at length a decision of the Appellate Division of the Supreme Court of New York in the case of a Hoboken hackman who was temporarily transporting passengers to the temporary piers of the North German Lloyd Company in Brooklyn following the destruction by fire of the Hoboken piers. The hackman was arrested for failure to take out a license in New York, as required by ordinance, and the Supreme Court of New York held that the upholding of a decision against the hackman would justify retaliatory measures on the part of New Jersey and would be inhospitable. A decision is not expected before April.

Cobe Cup for Stock Cars Accepted.

Following immediately after the official acceptance of the proffered Cobe trophy for a stock car race near Chicago, which took place at the Boston meeting of the board of directors of the American Automobile Association last week, a delegation of the Chicago Automobile Club which is promoting the event, made a thorough survey of the proposed Lake County, Indiana, course, with the result that it was pronounced as being not only satisfactory, but in many respects superior to the Briarcliffe circuit in Westchester county, N. Y., if not equal to the Vanderbilt course itself. While one short section still remains indeterminate, the measurement of the course as gone over by the official delegation on Sunday last, was 23.6 miles. It is proposed to make the race 400 and possibly 450 miles long, though this point has not been definitely decided as yet. There are two straightaways, one of 6 miles and the other of nearly 10 miles, while in other portions the course presents a serpentine contour sufficiently trying to tax the skill of the most experienced driver to the utmost. Practically throughout its entire length it is wide enough for two cars to pass.

Chairman Charles P. Root of the contest board of the club has increased the membership in his committee from three to five, in order the better to handle the work of the two days meet which is fast assuming large proportions. The membership as it now stands is composed of F. H. Trego, O. G. Temme, H. P. Branstetter, C. A. Tilt, B. Edwards, J. B. Diebler and F. N. Martin.

Dates Fixed for Detroit's Run.

This year the annual reliability run of the Detroit (Mich.) Automobile Dealers Association will be a four days affair, starting on May 10th and finishing on the 13th.

FRELINGHUYSEN BLOCKS REVISION

New York New Jersey Senator Holds up Colgate Bill for Amendment—Senate Extends the Speed Limit.

Although it was expected that the Colgate bill, which is several degrees more American-like than the existing Frelinghuysen laws, would come up for passage in the New Jersey Senate on Tuesday last, that more or less eminent New York New Jerseyman, Senator Joe Frelinghuysen, let it be known that he was still "on guard" and would strenuously oppose any effort to draw the teeth of his pet measure, and no action was taken. The Colgate bill proposed to increase the speed limit to 30 miles per hour and to permit non-residents to use the roads of New Jersey for 30 days for $1, instead of levying on them the same stiff fees which are exacted of residents of the State.

Frelinghuysen, however, thought that was giving too much for the money and in a subsequent conference decided that eight days for $1 is sufficient and the Colgate bill probably will be amended. On Tuesday, however, the Senate passed the Bradley amendments, extending the speed limit to 25 miles per hour and reduces the fees of justices of the peace to $2.85. Previously, the House had considered the Colgate bill and reduced the 30 miles an hour clause to 20 miles, and also defeated an amendment proposed by Representative Meyer to increase the fees. The House, however, unanimously passed another Colgate bill aimed at "joy riders." It provides that any one driving a car without the positive consent of the owner or while intoxicated, shall have license revoked and be adjudged guilty of a misdemeanor.

North Carolina Law Exempts a County.

North Carolina has placed a new automobile law on its books which will become effective July 1st next, but which remarkable to relate exempts from its operation the little seacoast county of New Hanover in which Wilmington, the chief city, is located. The law imposes a registration tax of $5, annual renewal fee of $1. The county in which the owner lives is to receive $3 of the initial $5 payment for the benefit of the road fund. Speed is limited to 25 miles an hour on rural roads and 12 miles in incorporated towns, except in business portions, where eight miles is the limit. There are regulations as to precaution in passing frightened horses and a lot of machinery in detail for the application of the law. Violations are punishable by fine or imprisonment, and the third offense, in addition to any other punishment, entails the revocation of the registration certificate and the rights of the offender to operate a motor car in the state.

SPEARE SUCCEEDS HOTCHKISS

Bay State Man Chosen to Fill Unexpired Term of A. A. A. President, Who Retires—New Director Chosen.

The retirement of William H. Hotchkiss, of the American Automobile Association, who has served ably in the presidency for two and a half years, and the election of Lewis R. Speare, president of the Bay State Automobile Association to succeed him, formed the most important feature of the quarterly meeting of the board of directors which was held in Boston on Thursday of last week, 11th inst. Judge Hotchkiss, whose retirement had been predicted prior to his re-election last fall, was compelled to resign owing to the assumption of his new duties as State Superintendent of Insurance of New York, a position to which he has only recently been appointed, and which would have left him no leisure for his duties as executive head of the A. A. A. His newly elected successor is thoroughly familiar with the work of the association, having served in the capacity of vice-president for several years, in addition to retaining a prominent connection with various other automobile organizations which is of long standing. He was elected to fill out the unexpired period of the former president's term of office, which will expire on December 1st.

EXECUTIVE COMMITTEE OF THE A. A. A.

The top row from left to right—1, E. P. Chalfant; 2, A. E. Lerch; 3, F. B. Hower; 4, S. A. Miles; 5, A. D. Converse. Bottom row, left to right—1, Louis R. Speare (the new president); 2, F. P. Coughlin; 3, F. H. Elliot; 4, C. H. Gillette; 5, T. H. Powers, Jr.; 6, Francis Hurtubis; 7, W. H. Chase; 8, H. R. Burbeck; 9, E. T. Whitmore.

At this meeting also the Colorado State Automobile Association, comprising six automobile clubs with a membership upwards of 650; and the South Dakota Motor & Vehicle Association, comprising six county motor clubs with a membership of 300, were admitted to State association membership, thereby making in all twenty-seven State associations affiliated with the National body, and adding nearly 1,000 names to the membership of 20,000. The Lookout Mountain Automobile Club of Chattanooga, Tenn., was elected to membership as an unfederated club in the A. A. A.

George C. Diehl, of Buffalo, was appointed by President Speare as chairman of the A. A. A. Good Roads Board; also chairman of the National Convention Committee, succeeding C. Ogden Neff, of Cincinnati, whose resignation was accepted with regret. Mr. Diehl is a member of the Board of Governors of the Automobile Club of Buffalo, county engineer of Erie county, and was chairman of the committee on practical demonstration at the first annual good roads and legislative convention of the A. A. A., held in Buffalo last July, and is therefore well qualified to take up the important duties assigned him.

The deed of gift of a trophy for a stock chassis race donated by Ira M. Cobe, president of the Chicago Automobile Club, was accepted, with the approval of the contest board, and was referred to this board with power to conduct the race, which is to be run annually until the same person wins it twice. Only members of Clubs in the A. A. A. can compete for the trophy, and during the next two years the race must be run within 50 miles of Chicago. The distance must not be less than 250 miles, and it cannot be held on any horse or bicycle track.

P. M. Milner, president of the Motor League of Louisiana, was elected a member of the board of directors to fill the vacancy created by Judge Hotchkiss's resignation and the election of President Spear. Those present at the meeting were: First Vice-President Lewis R. Speare, president Bay State A. A., presiding; Frank B. Hower, of Buffalo, chairman A. A. A. contest board; E. P. Chalfant, general manager A. L. A. M.; S. A. Miles, general manager N. A. A. M.; A. D. Converse, vice-president Massachusetts State A. A.; J. P. Coghlin, president Worcester A. C.; A. E. Bliss, president Massachusetts State A. A.; W. H. Chase, Wachusett A. C.; C. H. Gillette, secretary Connecticut A. A.; W. B. Lasher, A. C. of Bridgeport, Conn.; L. J. Powers, Jr., Springfield, Mass.; A. E. Lerche, president A. C. of Springfield; W. W. Brown, president A. C. of Vermont; Francis Hurtubis, of Boston; E. F. Whitmore, Willimantic, Conn.; F. H. Elliott, secretary A. A. A.; H. R. Burbeck, North Abington, Mass.

A. A. A. Sanction for Daytona Meet.

Clouds which for a time threatened to overshadow the forthcoming Daytona race meet with a storm of difficulty over the question of sanction, at length have been cleared away by the issuance of the official certificate of the contest board of the American Automobile Association. Entries for the meet, which is to take place March 23-26, were to have closed on Thursday of last week, but have been extended one week. In sanctioning the affair the contest board named S. A. Miles general manager of the National Association of Automobile Manufacturers, as referee, while Alfred Reeves, general manager of the American Motor Car Manufacturers Association, was nominated to serve as official representative of the board. It was agreed that entrants shall use A. A. A. entry blanks in conjunction with the original blanks, and further, to strike out any reference in the original blanks to the Automobile Club of America and to international races. The applicant also agreed to issue an order on the Merchants Bank of Daytona to hold the prize money for payment to the various winners on order of the referee, Samuel A. Miles, of Chicago.

Protests Against Women as Contestants.

Influence from the manufacturer's side is being brought to bear on the contest board of the American Automobile Association to eliminate the feature of women drivers from the forthcoming Glidden touring contest. The movement took the form of a request transmitted to the board by a number of representative manufacturers, who met in New York recently, that the board adopt a rule to the effect that "only males of 18 years or over be eligible to take part as contestants or drivers in the annual tour of the American Automobile Association." Although no action has yet been taken in the matter, the attitude with regard to it may be described as such as to make its adoption seem likely.

Two New Cars Appear at Kansas City Show

To the average easterner it is not readily appreciated that Kansas City is the third largest distributing point in the country, but whether or not, such is the claim made for it by the local dealers, which held the boards in Convention Hall during all of last week. Hence the "K. C." show was an event of no mean importance, even though coming at a time when practically all the exhibits are representative of products which already have been uncovered at earlier exhibitions. Something like 170 vehicles were displayed, thus placing the exhibition well above the ordnary level of purely local shows; and these represented the products of some half a hundred makers.

Unusual success was achieved in so masking the bare ironwork of the hall as to temper its appearance of great size and prevent the show from seeming scattered and lost. The ceiling and walls were closed in with bunting in white and green tints, the same hues appearing in the surrounding arcade and in the balconies where the exhibits also were placed. For divisional boundaries vertical columns entwined with greenery and topped with electric globes aided materially in producing the desired effect, as did the occasional use of potted palms. But the piece de resistance of the decorative scheme was the frieze which surrounded the wall panel just below the ceiling and which was laid off in separate oil paintings representing picturesque spots along the old caravan route leading out into the great West in the days when that trail was the main thoroughfare between Kansas City and Mexico. The pictures were painted from photographs taken at points depicted.

Among the cars presented were two of local origin which were absolutely new. One of these, the Gleason, is made by the Kansas City Vehicle Co. The machine is of the low-priced order, made in a variety of body equipments to suit the demands of pleasure or utility uses, and equipped with medium sized wheels and solid tires. The motor is a 16 horsepower, twin-cylinder, opposed affair, with mechanically actuated valves, mounted in front and driving through to the live rear axle where is mounted the selective sliding change gear. Another form which is cataloged has the motor and change gear mounted in front on a sub frame, while the differential and axle casing contains the rather unusual formation of a bevel reduction driving the differential through a pair of spur gears. The wheels of this machine are 38 inches in diameter, shod with 2-inch oval tires. The road clearance is 14½ inches, and the wheel base is 90 inches.

The other newcomer was the Wonder, made by the Wonder Motor Car Co., which is of the buggy type, and also is intended to serve distinctly utilitarian purposes. To this end, it is equipped with a long box body of the so-called democrat or beach-wagon type, with a removable rear seat which may be demounted in order to provide adequate space for light loads.

As has been the case with all local shows this year, the matter of attendance proved no disappointment to the management, despite the fact that the show opened in a rainstorm and that the second day was marked with the advent of a small sized blizzard. The show was held under the direct management of the Kansas City Automobile Dealers Association (Inc.), W. S. Hathaway acting as chairman of the show committee. The list of automobile exhibitors was as follows:

Automobile Sales Co., Pope-Hartford; Buick Auto Co., Buick; Fletcher Cowherd, Jr., Auto Co., Corbin, Royal Tourist, Rauch and Lang electric; Central Auto Co., Thomas, Cadillac; Demster Machine Co., Locomobile; John Deere Plow Co., Velie; Ettwein Motor Car Co., Mora, Crawford, Stoddard-Dayton, Welch, Fritchle electric; Ford Motor Car Co., Ford; Franklin Motor Car Co., Franklin; Kaw Valley Auto Co., Mitchell; E. P. Moriarty & Co., Packard, Stevens-Duryea, Chalmers-Detroit, Woods electric; W. H. McIntyre & Co., McIntyre high wheel buggy; Tebeau Motor Car Co., Stearns; Western Motor Car Sales Co., Overland, Brush, American; Dey Motor Car Co., Pierce Arrow; Jackson Motor Car Co., Jackson; Maxwell-Briscoe Auto Co., Maxwell; Midland Motor Car Co., Peerless, Oldsmobile, Matheson, Detroit and Waverley electrics; Missouri Valley Auto Co., White steamer, Dorris, Premier, Reo; Rambler Auto Co., Rambler; Studebaker Bros., E-M-F., Studebaker and electrics; Woodward Auto Co., Knox; Bruenning Bros. Auto Co., Apperson; Columbus Buggy Co., Electric; Great Western Auto Co., Great Western; Moon Motor Car Co., Moon; C. L. Taylor Motor Car Co., Regal, Marmon; Wonder Auto Co., K. C. Wonder; Auburn Motor Car Co., Auburn; Babcock & Co., Babcock electric; Bradley, Alderson & Co., Fuller; Hollister Auto Co., Great Smith; L. W. Scott, Stanley steamer; Selden Motor Car Co., Selden; Winton Co., Winton Six.

The following displayed accessories: Fidelity Oil Co., Vanguard Mfg. Co., Columbus Buggy Co., Keystone Oil Co., Holcker & Elberg, E. P. Moriarty & Co., Pioneer Auto Top Co.

Minneapolis Show Uncovers Two New Cars

While Chicago and Boston, of the greater shows, have in times past laid stress upon the soul of music as a means of charming the show goer, it remained for Minneapolis to introduce real vaudeville for this same laudable purpose.

In common with the other and more familiar forms of show announcement, the preliminary introduction of the second annual show event, which opened in the new Armory on Saturday last, 13th inst., and will run through to the end of the present week; it was advertised that vaudeville entertainment would be provided in a suitably appointed place, and that the show, with various changes in the bill, would be given twice daily, afternoon and evening. Of course, moving pictures of automobiles whisking around hairpin turns, turning upside down and otherwise misbehaving themselves, form an important part of the program.

But apart from this feature, the Armory decorated in primrose and purple, encloses a very wide-awake and representative lot of exhibitors—some 50 of them—who are exhibiting a good line of standard cars, together with one or two newcomers of local production. One of these is the Kato, which is built by the Kato Auto Co., of Mankato, and is a commercial vehicle. Another is the Wolfe, which is produced by the H. E. Wilcox Motor Car Co., in Minneapolis.

The latter machine is built both in 2 and 3 ton styles, and is of generally standard construction in so far as its mechanical arrangement is concerned. As is the case with so many commercial vehicles built at the present time, the body is adapted to suit the needs of the purchaser, and the chassis alone figures as the stock element in the vehicle. The motor is rated at 30 horsepower, and is of the four-cylinder vertical pattern, with cylinders cast in pairs and measuring 4¼ by 4½ inches, bore and stroke. Self-contained engine lubrication, complete double ignition, with Bosch magneto and storage battery and valves arranged all on one side to develop the maximum of engine accessibility, are among its special features. Transmission is through a leather-faced cone clutch, and three-speed sliding change gear to the counter shaft, from which the rear wheels are propelled by double side chain connection. White brass and bronze bearings are used on the engine and transmission bearigs, but the axles have the Timken roller bearing equipment.

The full list of exhibitors is as follows:

Automobiles—Barclay Auto Co., Thomas and Chalmers-Detroit; Black Mfg. Co., Black motor buggies; Deere & Webber Co., Velie; East Side Automobile Co., Oakland and Gyroscope; Cartercar Co., Cartercar; Fawkes Auto Co., Rambler, Overland, American, Reo and Holsman; Haynes Auto Co., Pennsylvania, Welch, Midland and Regal; Kato Auto Co., Kato commercial;

Digitized by Google

Kemp Bros., Automobile Co., Brush; La-Crosse Implement Co., Jackson; Maxfield Auto Co., Kisselkar; Michigan Auto Co., Knox; Motor Buggy Mfg. Co., motor buggies; Northwestern Auto Co., Ford; Pagel-Allen Auto Co., Schacht; Pence Auto Co., Stevens-Duryea and Buick; Victoria Motor Car Co., Pullman and A. L. Co.; Wilcox Motor Car Co., Wolfe commercial vehicles.

Accessories—Beckley-Ralston Co., D. C. Bell Investment Co., Buchanan & Wiley, Edwards Cycle Co., E. T. Farley, Fenstermacher, Garage Equipment Co., Hawkes Demountable Rim, Hudson & Thurber, J. N. Johnson, Joy Bros, Lyon Motorcycle Co., Minneapolis Electric Motor Co., Minneapolis Motorcycle Co., National Gauge & Register, W. M. Pease, Pierson-Wilcox Electric Co., Plant Rubber Co., Pure Oil Co., Rubberite Mfg. Co., St. Paul Auto Co., Shadegg Engine Co., C. J. Smith, Stata Oil Co., Topheim Mfg. Co., Thiem Mfg. Co., Universal Wind Shield Co., Wheeler Auto Co., Western Crucible Casting Co.

Wisconsin Holds Its First Show at Milwaukee

For the most part the local shows of the season are being promoted either directly by or under the auspices of the dealers' associations, of which organizations such a large and flourishing number are in existence. But in Milwaukee the local enterprize of the owners was manifest last week in the holding of the city's first show, and the first in the State, which ran for three days, Thursday, Friday and Saturday. Without the aid of professional promoters, the Milwaukee Automobile Club succeeded in inaugurating and carrying through to a successful culmination what was regarded as a remarkably fine exhibition of its class. The Hippodrome on Wells street was called into requisition for the purpose and proved none too large for the display of the 90-odd cars and the stands of the score and more of accessory exhibitors who for the most part filled the balcony spaces.

Among the 30 exhibitors of cars were several displaying vehicles which have not before been shown this year. Thus the Johnson Service Co., a local concern, and one of the rare and conspicuous examples of persistant adherence to steam practice, presented their car of the same name, which, though it has been shown in New York in previous years, is better known in the middle West than in the East. This machine, it will be remembered, is distinguished by the use of poppet valves and characteristics usually identified only with gas engine practice, such as single acting pistons and other features of general construction, such that it readily might be taken for an internal combustion engine were it not for the presence of the boiler.

Another of the newcomers was the Sternberg commercial vehicle, a 2,000 pound express or delivery wagon mounting such features as a 20-horsepower opposed motor of 5 by 4 inch cylinder dimensions, single disc friction drive, and all-steel wheels. The Sternberg Mfg. Co. also is a local concern, and its product is so recent in origin as to be little known as yet outside its home town. It also is produced in a larger four cylinder type.

The exhibitors of complete vehicles of all sorts were as follows:

Automobiles—Akin Motor Car Co., Stevens-Duryea and Columbus electric; American Automobile Co., Apperson, Pierce-Arrow and Babcock electric; Bates-Odenbrett Co., Buick and Winton; G. W. Browne Motor Co., Marmon, Mitchell and Holsman motor buggy; Willard Campbell, Haynes; Curtis Automobile Co., Reo; Emil Estberg, Pope-Hartford, Waverley and Woods electrics; Excelsior Motor Car Co., Cameron; Gove Automobile Co., Jackson and Regal; W. L. Hibbard Motor Car Co., Chalmers-Detroit and Thomas Flyer; Hickman-Lauson-Diener Co., Cartercar and Ford; High Wheel Auto Co., International; Johnson Service Co., Johnson steamers; Jonas Automobile Co., Cadillac and Peerless; Kisselkar Co., of Milwaukee, Kisselkar; Kopmeier Motor Car Co., American and Detroit electric; McDuffee Automobile Co., Stoddard-Dayton; Ogden-Farwell Garage, E-M-F. and Studebaker gasolene and electric; Olds Motor Works, Oldsmobile; Rambler Garage Co., of Milwaukee, Rambler; Riverview Automobile Co., Moon; Sanger Automobile Co., Franklin; E. F. Sanger Co., Maxwell; Schreiber Motor Car Co., Knox and Locomobile; Stephenson Motor Car Co., Overland, Speedwell and Welch; Sternberg Motor Truck Co., Sternberg trucks; Welch Brothers Motor Car Co., Packard and Rauch & Lang electric; White Auto Co., White; Wisconsin Auto Exchange, Midland and Stearns.

Accessories—Charles Abresch Co., Julius Andrae & Sons Co., Beaver Motor Co., Bland-Mueller Auto Co., Cream City Trimming Co., General Accumulator Battery Co., Theodore M. Glassner, Goodyear Rubber Co., Philip Gross Hardware Co., Theodore Habhegger, Harley-Davidson Co., Kamlee Trunk Co., King Leather Tire Co., Arthur Koenig Co., Kopmeier Motor Car Co., T. H. Kuenzli, Lembske-Briggs Coil Co., A. J. Monday, Pattison & Ellis, Wadhams Oil & Grease Co., Wold Bros., George Wordingham.

Portland, Oregon, Holds a Show.

In its westward march, the local show movement has laid hold upon the State of Oregon, with the result that Portland motorists and would-be motorists were held in its thrall during the whole of last week, 8-13th insts. Under the auspices of the Portland Automobile Club, something like 100 vehicles were gathered together, covering the entire price scale, and representing all known types. The following agencies exhibited:

Automobiles—Archer, Combs & Winters Co.; C. B. Brown, American Roadster; F. A. Bennet, Mitchell, Stoddard-Dayton, Reo and Rapid commercial; Covey Automobile Co., Pierce-Arrow and Cadillac; Crowe & Burgess, Marmon, Overland and Oldsmobile; Graham Motor Car Co., Stevens-Duryea and Selden; Idanha Motor Car Co.; J. B. Kelley, White and Ford; W. L. Keats Automobile Co., Pope-Hartford, Packard, Thomas, Chalmers-Detroit and Buick; Maxwell Agency, Maxwell; Oregon Electric Vehicle Co., Columbia electric; Portland Motor Car Co., Peerless; Renault Freres, Renault; Studebaker Bros. Co., Northwest, Studebaker and E-M-F.; Tourist Car Co., Tourist; Winton Auto Co., Winton.

Accessories—Backus & Morris, S. F. Bowser & Co., Ballou & Wright, Firemans Fund Insurance, Firestone Tire & Rubber Co., Freer Cutlery Co., J. R. Greenfield, Hassam Paving Co., Jeffries & Gaylord, Kline Machinery Co., F. P. Keenan & Co., Palmer Bros., Valvoline Oil Co.

Rochester's Second Show Draws Well.

Twice blessed this year in the matter of shows, Rochester, N. Y., is enjoying its second entertainment of the sort during the whole of this week. Because of a conflict of interests the Automobile and Motor Trades Association and the Rochester Automobile Dealers Association decided to gather their clans independently this year, and in consequence, Convention Hall is having its second run of automobile visitors this week, under the auspices of the latter organization. This is also the second annual exhibition of the dealers' association. Despite the recent occurrence of another show in the same building, the effort to secure an adequate list of exhibitors has been more than successfully rewarded. For not only filling the regularly laid out spaces in the main hall, the show overflows into the surrounding corridors until every available inch of space has been taken. This may be on account of the caryatides. The caryatides, it should be explained—and is by the press agent of the show—were priestesses of the ancient temple of Artimesia. But in their present guise, they serve as guardians of Convention Hall, Rochester, N. Y., about which they are grouped in heroic size. Within, the usual forces of statuary, bunting, flowers, lights and music have been marshalled to render the show attractive.

NEW YORK TO SEATTLE PROGRAM

Date Fixed for Transcontinental Contest—Rules Forbid Flanged Wheels for Negotiating Railway Tracks.

All doubt as to the status of the transcontinental contest from New York City to Seattle for the M. Robert Guggenheim trophy—whether international or otherwise—was dispelled this week by the issuance of entry blanks. It will be termed the "International Contest for the M. Robert Guggenheim Transcontinental Trophy," and as stated upon the entry blanks will be promoted under the auspices of the Alaska-Yukon-Pacific Exposition and of the Seattle Automobile Club under the sanction of the Automobile Club of America.

The date of departure from New York City has been fixed for Tuesday, June 1, and the entries close on May 15th, as disclosed by the entry blanks.

The salient feature of the rules for this 3,868 miles race across the continent is their beautiful simplicity. The most important one is Rule 3, which provides for the replacement of spare parts as follows:

There will be no observers on the cars. The technical committee of the Automobile Club of America will stamp each car before departure as follows: the side members of the frame, front and rear axles, engine base and cylinders, transmission case and steering gear. Contestants will be allowed to replace, without penalization, any of these parts, except frame, twice during the contest, but such reserve parts must be stamped by the committee before the contest and one set must be held at Chicago and the other set at Cheyenne, Wyo. These parts will be in charge of a member of the committee and may, when desired, be secured only from either one of these two places. The winning car must bear the stamps on arrival at Seattle. All other parts can be changed at will.

As the strain of driving might be too great for one man, it is provided than any member of the crew of a contesting car, who shall have ridden in that car continuously from New York, may drive. Each competitor may have as many members to his crew as he desires, except that no members can be added to any crew after the start.

Entrance fees are fixed as follows: For one car, $350; for two cars of the same make and entered by the same owner, $600; for three cars of the same make and entered by the same owner, $750; for each additional car of the same make and entered by the same owner, $100.

In addition to the Guggenheim trophy, which is advertised as being worth $2,000, and which will be given to the first driver reaching Seattle, cash prizes or plate, at the option of the contestant, are provided for. In addition to the trophy the driver of the first car will receive $2,000 in gold; the second, $1,500; the third, $1,000; fourth, $500; fifth, $300. It is stated that the third, fourth and fifth cash prizes will not be given unless there are more than ten entries and unless the fourth and fifth cars arrive at the finish within seven days of the arrival of the second car.

In order that the cars shall travel over the roads the entire distance, it is provided that no contestant can carry on his car or use at any point during the race, wheels equipped with flanges suitable for traveling on railroad tracks. Official checking stations will be established en route.

Changes in New York Carnival Plans.

A combination of circumstances has resulted in the determination of the Automobile Carnival committee of the New York Automobile Trade Association to alter the date of the second annual carnival from the week of April 5th to the week beginning April 26th. This announcement followed a meeting of the committee held on Thursday of last week, and resulted in a re-arrangement of the dates of the various events incident to the carnival program, as follows:

Monday, April 26, hill climb; Tuesday, April 27, straightaway races and speed trials; Wednesday, April 28, souvenir day and banquet; Thursday, April 29, gymkhana games, obstacle races, etc.; Friday, April 30, endurance run; Saturday, May 1, afternoon carnival parade.

As the activities of the committee continue, further details of its plans are unfolded. The parade, which as was the case last year, will be the feature most appealing to the general public, again is to be presided over by a king and queen who will be chosen by popular vote. It has been decided that the ballots for this purpose shall be sold at 1 cent each, and shall be placed in the hands of the various tradesmen at an early date, when fuller details of the scheme will be announced. Entry blanks for the parade will be issued only to those who contribute to the carnival fund, in return for which cars which they enter will be given position numbers in the line. No advertising or other placards other than those numbers will be permitted. At the same time the parade will be open to all, the requirement of previous entry applying only to those who are to compete in the decorated section.

A special sub-committee has been appointed to look after the interests of the endurance run which it is planned to hold on Friday of Carnival Week. Alex Schwalbach has been appointed chairman and has announced that the following members will assist in the work: Herman F. Kuntz and Coker F. Clarkson, of the Association of Licensed Automobile Manufacturers; Alfred Reeves and L. M. Bradley, of the American Motor Car Manufacturers Association; E. L. Ferguson and F. L. Harbach, secretary of the Quaker City Motor Club.

Carnival headquarters have been opened in the main store of the American Building, Columbus Circle and Broadway.

READY FOR THE SPEED CARNIVAL

Well Known Drivers Who Will Compete in Four Days Meet at Daytona—The Big Events on the Card.

Unless the unexpected happens it will be surprising if any startling performances are made at the seventh annual speed carnival to be held on the Florida zeach at Ormond, next Tuesday, Wednesday, Thursday and Friday, 23d-26th insts. At a late hour yesterday, according to information secured from the office of W. J. Morgan, the New York representative of the Florida East Coast Automobile Association, entries of only a dozen cars have been made, although it was stated that several other entries made with the Florida representatives had not yet reached New York.

Hugh D. McIntosh, a prominent Australian sports promoter, reached New York last week and while here he purchased the big Benz racer, which has been shipped to Florida and which will be driven, it is stated, by David Bruce-Brown, the young New Yorker who last year acted as mechanic for the late Emanuel Cedrino. Ralph De Palma will drive the Fiat "Cyclone" in all events in which it is eligible. The other well known drivers and their cars who will enter the speed trials and long distance events are Lewis Strang, George De Witt, Robert Burman and possibly Louis Chevrolet, with western-made cars; Herbert Lytle, who probably will drive the Renault; H. J. Kilpatrick, with the 120 horsepower Hotchkiss, and James Laughlin, 3d, Cleveland. W. H. Peters, of Daytona, has entered a Pope-Hartford and another Hotchkiss, and entries have been made for a Chalmers-Detroit and a Cadillac, although the names of the drivers are not obtainable. The motorcycle and bicycle events are well filled.

The program is a lengthy one, consisting of twenty-two events, of which nine are for automobiles. These include the 200 miles Florida stock car price class race, with five classses; the 200 miles piston displacement class race, with four classes; the 100 miles Minneapolis trophy race, which has been won once by Fiat, Mercedes and Napier cars, and must be won twice to become the property of the winner. The other events are the two miles a minute race against Demogeot's record of 58⅘ seconds; the one mile race for the Dewar trophy; the international free-for-all at one, five and ten miles heats; the 5 miles Southern price and horsepower handicap for residents of Southern States; the 50 miles open to Vanderbilt Cup cars, and the mile record trials.

It is planned to hold the events each afternoon during the meet because high tide prevails in the morning. No schedule has been arranged and the races will be run according to the judgment of the referee, who will be S. A. Miles.

ESSENTIALS OF GRINDING WHEELS

Atomic Elements of Abrasives and How They Act—Natural Substances Excelled by Artificial Products.

Increasing use of the grinding wheel by automobile manufacturers to secure a more rapid and accurate finishing of motor car parts, makes the nature of the process and the composition of the abrasive wheels deserving of more than passing notice. The process of finishing the surface of metals, or other materials by grinding, though familiar mechanically, is not so generally understood in its theoretical aspects. It consists of bringing the work to be ground, in contact with a grinding wheel, revolving at high speed, in which the hard, sharp particles of emery or other abrasive, on the working face of the wheel cut off minute chips.

When subjected to microscopical examination, these chips bear a resemblance, on a smaller scale, to those cut off by lathe or planer tools. Each of the small cutting points on the face of the wheel may be likened to individual tools and, like them become dull after being used for a while.

Just there the selection of the proper grade of wheel for the work becomes important. That the wheel may continue its efficiency the particles of abrasive, after losing their keenness should break out of the bond, which unites them in a circular form, and give way to new cutting edges. If the strength of the uniting bond, or cement-like substance in which they are carried, be so great as to prevent the grain breaking off, the cutting face of the wheel becomes glazed over, or dulled, and tends to burn the work unless it is frequently dressed to renew its cutting face. On the other hand a bond of soft quality will release the granules before they have been utilized to their full extent, and thus shorten the life of the wheel.

Grinding wheels are thus made in several grades of varying degrees of hardness, and the wheel selected for a given piece of work should be exactly adapted in its yielding qualities for the purpose which it is intended to serve and in this respect the hardness of the wheel is in proportion to the nature of the bond. The term hardness, used in this connection thus applies equally to the quality of the abrasive and the hardness of the retaining medium. The abrasive itself should possess to its highest degree the right combination of hardness, keenness and temper. In the past hardness has been deemed of primary importance, this consideration being in large measure due to the practice of various manufacturers who have exploited the supposed superiority of this quality over all others, thus giving rise to the erroneous impression. Physical and scientific tests fail to support this impression, however. While it is important that a good abrasive should have the right degree of hardness, this requisite is not by any means the premier essential. This is attested by the fact that in the cutting of metals, the hardest tools are not always the most efficient and that the temper is varied in accordance with the quality of the work. Therefore, since grinding consists in removing small chips in large quantities, the right temper of the cutting tools becomes of corresponding importance.

By "temper" is meant the strength of the grain and the character or nature of its fracture, under working pressure. Blending the degree of temper and hardness to the proper proportions, forms the most essential qualification of an efficient abrasive. An unequal development of either quality at the expense of the other will fail to produce the desired efficiency, which can be obtained only by the proper combining of both, in the formation of the grain. Similarly, when considered from an independent standpoint and without regard to other necessary qualifications, extreme toughness of an abrasive grain or its high resistance to crushing pressure is not a prime essential. Specially treated steels possess this quality to a large degree, but it requires small argument to demonstrate that particles of steel if bonded together in the shape of a wheel would not have a high cutting efficiency owing to the character of the granular structure of the metal.

For the highest efficiency under working conditions a grain of abrasive that is slightly dulled, but not worn out, should not entirely sever itself from the retaining elements. Its temper should be such that it will fracture and expose new cutting edges to the work. Conversely it should possess a sufficient degree of hardness to remain integral until its cutting point becomes dulled, and when breaking it should split with a sharp, crisp fracture, to give a new and keen cutting edge. The character of the fracture depends upon the physical formation of the grain, its structure and crystalization, in other words.

In the composition of abrasive wheels emery, owing to its production in large quantities and consequent cheapness, has been largely employed. It is a mixed form of corundum, but contains a greater percentage of iron and silica.

In its natural state corundum passesses in a high degree the desirable qualities necessary in an abrasive suitable for grinding wheels and has been largely used for the purpose. But among its ingredients is found a variable percentage of iron and silica, which are undesirable increments and which may detract from its advantages.

In these days of rapid advances in the arts and sciences, a rapid demand has arisen for an abrasive superior to emery, or corundum. This demand has been met by the production in large quantities of several artificial minerals, which are produced under the intense heat of the electric arc, and which are known to the public under the various trade names of their makers.

Without entering too deeply into details, suffice it to say that these substances are produced through an artificial reproduction of the natural conditions of intense heat and pressure which produced the less perfect native elements, but guided and controlled by human skill and judgment in such a way as to eliminate such qualities as are found to be undesirable. As is true of corundum, the artificial abrasives are composed chiefly of crystaline aluminum oxide, its qualities of hardness and temper being regulated during production in a manner closely analagous to that in which the corresponding properties of steel are developed.

The mineral Bauxite, as the purest form of aluminum oxide found in nature, is largely employed for the purpose. After being inspected and sorted in various grades according to its composition, and washed, it is calcined, or subjected to high heat in the presence of the air, to rid it of all moisture. Subsequently, it is fused in an electrically heated crucible, and in the direct presence of the arc, whence it emerges in the form of an ingot. This huge, crystaline mass is then broken up and reduced to powder-like consistency by successive processes of crushing and grading.

Even here, the manufacturing process may be considered a counterfeit of natural methods, for as in the modern grinding wheels the abrasive is held in bond by substances which possess no cutting value in themselves, so in the sand-stone, from which the grind-stones are cut, which formed the earliest form of abrasive wheel, the fine particles of silica or sand were bound together by a soft, yielding medium which is useful only as a tool holder, for the minute cutters which are embedded in its surface. Besides answering the old riddle of how a stone so soft that it could be carved with a knife also might be made to sharpen the blade by rapidly wearing away a portion of the metal, the illustration also serves a purpose in explanation of the modern abrasive tool.

Mending Interior Cut in Tire Casing.

When a car is standing in a garage or enclosed room with the engine running the fumes of the exhaust cause the air to become vitiated and have a poisonous effect on those who breathe it. To overcome this corruption of the atmosphere an English motorist has designed a new system of piping for garages and buildings in which motor cars are stored to carry off the products of combustion. The pipes are suspended from the ceiling and are so arranged that in whatever part of the building the car may be standing, the muffler or tail pipe may be connected to them by a flexible tube and the exhaust led direct to the outer air. This arrangement permits the engine to be run indoors for testing or adjusting without being detrimental to health.

METHODS OF ENGINE LUBRICATION

Novel Theories Advanced by an English Engineer—How Carbon Deposits May Regulate Cylinder Temporature.

Engine lubrication ever has been a fruitful topic for discussion and is likely to continue to be for some little time to come, despite improvements in methods of distributing and feeding the oil, for the very good reason that the internal combustion motor, however satisfactory it may be when operating under proper conditions, is one of the most sensitive pieces of apparatus ever designed, when matters go awry. One or two novel aspects of the subject are brought out by J. W. G. Brooker in a paper read at the Royal Automobile Club (of Great Britain) Associates' headquarters, last month, in which he speaks of the engine lubricant as being mainly consumed either by leakage or by being burnt in the cylinder, and advances the somewhat novel idea that in certain types of small engine, the presence of a small amount of carbon deposit is rather beneficial than otherwise. His viewpoint is, of course, that of current English practice.

"Much has been said and written on the subject of carbon deposit," he remarks, "and the question is as important as ever. A few words as to its effects may be of interest. In the first place, it acts as a non-conductor of heat, and in the case of the many cars on the road in which, when the pump or radiator are working well, the cylinders are kept too cool, its presence in a small quantity is actually beneficial. To obtain the highest efficiency from the fuel, the charge of petrol and air at the moment of its ignition must be both highly compressed and hot. The hotter it is and the more highly it is compressed the greater is the power obtained from any particular weight (not volume) of mixture within reasonable limits. . . . . A highly compressed and hot charge burns more quickly, and the effect is somewhat the same as when using a very hot spark and advanced ignition. When the cylinder walls and head are kept too cool, the temperature and pressure of the compressed charge are too low; the temperature and pressure at the completion of ignition are, as a result, too low, and the proper curve is, in consequence, smaller in area than it might be. . . . . Further, during the power stroke the head and walls of the cylinder and the top of the piston are all robbing the exploding mixture of a proportion of its energy in the form of heat, and the cooler these parts are the greater will be the percentage of energy lost in this way.

"The obvious result, therefore, of too cool cylinder walls and piston is that less power is obtained from the same unit of fuel, or in other words, if less heat is lost through the cylinder walls, more useful energy will be obtained from the same quantity of fuel. Please let it be understood, however, that the above is not a defence of carbon deposit, but a plea for rational cooling. . . . .

"The causes of carbon deposit are numerous. The fit and design of the piston and the piston rings are, of course, among the chief factors to be considered. . . . . When the lubrication is by splash the temperature of the crank case is another factor in the question. The oil is heated unnecessarily when the crank case is too hot, and in this condition it is more freely splashed, and it will also more readily get past the piston rings. In the majority of true force-feed lubrication systems the pistons rely for their supply on what is splashed off the big ends and crank webs as they revolve, and even if the oil is hot, and, therefore, thinner, very little more circulates and is thrown off than when it is comparatively cool. With a properly designed force-feed lubrication system, however large a quantity of oil is in circulation, it is practically impossible for the pistons to be much too liberally supplied. Their supply is confined to what is thrown off the big ends and crank webs, and this is limited by what emerges from the bearings.

Oil is mainly consumed in two ways—(1) leakage at the bearings, joints, and tappets; (2)burnt in the cylinder. The cure of the first is obvious, although it is a matter that is not always attended to; the second cause of diminution can be checked by limiting the amount splashed. . . . . It is obvious that by checking the amount consumed one is also diminishing the rate of formation of carbon deposit.

"The purity or otherwise of the oil used is, of course, of considerable importance. Even the best possible cylinder oils contain small quantities of bitumen and tarry matter, and these are the first to be attacked by the flame. Of course, I am referring only to the proportion that gets past the rings. The deposit is largely augmented by mineral matter, mainly dust from the road, brought into the cylinder with the charge; also by carbon deposit from incomplete or imperfect combustion of the petrol.

"The subject of Compound vs. Pure Hydrocarbon oils has for long been a favorite subject of discussion, and the reported use of pure castor oil in the high piston speed engines of many of the racing and hill climbing cars in France last year has stimulated interest in the matter. It is obvious that the use of a pure fatty oil such as castor is out of the question for general motor lubrication. It is comparatively expensive, the smell from the exhaust is obnoxious; but the chief objection is its tendency to gum on the bearings and all exposed surfaces. This thickening, due to oxidation, is more or less a pronounced feature of all fatty oils. However, where the car is being frequently dismantled and cleaned, as in the case of racing engines, the slight oxidizing tendencies of non-drying oils are negligible. One of the chief features of the fatty oil is its ability to stand high temperature without decomposition or appreciable thinning. . . . . When a very high piston speed is adopted it is of the utmost importance that the piston be able to slide with the least possible resistance of the nature of fluid friction. It has been found that the peculiar and characteristic greasiness of the fatty oil is the only thing that meets the conditions of low fluid friction combined with high lubricating value. . . . .

"The methods of lubrication of petrol motor car engines appear at first sight very varied; but they can really all be divided into one of two classes, 'splash or spray' and 'forced feed.' The simplest method of all is the oil bath in the crank case, into which the big ends dip and splash the oil over every moving part. In this, as in all the splash or spray systems, the oil arrives on the outside of the bearing, and it has to find its own way in. In the case of the forced feed method, on the other hand, the oil is introduced into the center of the bearing between the journal and the brasses and the pressure of a pump driven by the engine helps it out. In the Lanchester engine, for instance, the pressure of the oil in the system is 30 pounds to 35 pounds to the square inch.

"On the Vauxhall engine, which is considerably smaller than the one just mentioned, the forced circulation comes to an end at the big end bearing, and the piston and gudgeon pin rely for their supply upon what is flung from the revolving crank webs. This is adequate for medium powered engines, and the extension of the system to the gudgeon pins can be considered as a refinement for large engines. On several types of the Austin car two complete systems are installed—viz., the true force feed method for the crank shaft and connecting rod bearings and a drip feed from the dashboard to the cylinder walls. The force feed system uses the same oil over and over again, which is adequate for the bearings, while a small pump supplies drips, which can be regulated, feeding fresh cold oil direct to the cylinder walls.

Reverting now to the splash system, I am inclined to consider the Siddeley arrangement, recently adopted on all their cars, the most efficient and simple. It is briefly as follows: A pump, driven from the cam shaft, keeps four troughs, one for each connecting rod, overflowing with oil. The troughs are built across the crank case, each one in the path of its particular connecting rod. The big end is fitted with a copper scoop, which, as it comes to the lowest point in its travel, dips to the extent of about ¼ inch in the oil in the trough, creating a splash. The more the copper scoop is adjusted to dip the greater the splash, and it is only a matter of experiment to determine once and for all what the extent of the dip must be to give adequate lubri-

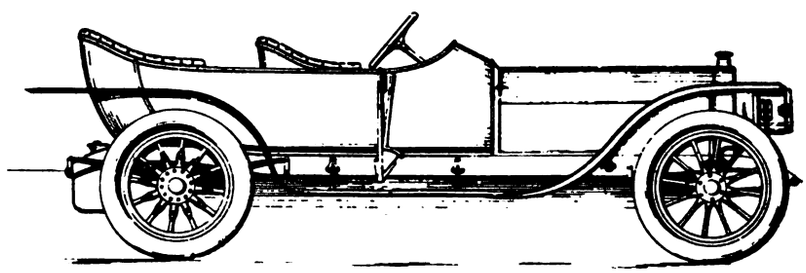
Digitized by Google

cation without excessive smoking and carbon deposit. The effect of the scoop continually striking the oil in the trough is, of course, to empty it, and to balance this the before mentioned pump keeps up a continuous flow into the canal, tending to keep it full.

"The pump is more than sufficient to accomplish this, with the result that the canal is always overflowing. The great feature of the system is the absolute uniformity of the depth of dip under every condition, and, as far as I am aware, this is not obtained with any other method of lubrication by splash. Like everything else, it has its weak point; but it shares it with many other lubrication devices and it is not a serious matter. The difficulty is this, that the adjustment of the depth of dip of the scoop is set for oil of a certain viscosity, with the result that the use of lighter or heavier oils gives less or more lubrication respectively than the mean. As the viscosity of the oil used is increased, so the depth of dip must be reduced, if the degree of lubrication is to remain constant. If a lighter oil than the standard is used, then the scoop should dip deeper. . . . .

"Variations in methods of splash lubrication are mainly variations in the methods adopted to feed the oil to the crank case. After it has reached the crank case it spreads itself, in the case of four-cylinder engines, into four divisions, one for each of the four big ends, which dip and create a splash. This arrangement minimizes the tendency for the oil to run on one end or the other of the crank case as the engine tilts up or down. The question therefore resolves itself into discussing the different methods of supplying the crank case, and, needless to say, every instrument claims to do so in the most regular and reliable manner."

Frequent Oiling for Planetary Gears.



Why the planetary type of transmission requires such frequent lubrication is often a cause for wonderment to the beginner. The reason is not far to seek, however, when it is remembered that the pinions or "planets" are of diminutive size, and when in action revolve at high rates of speed and under heavy load. This fact coupled with an altogether too frequent tendency of the brake bands to drag, when the car is at rest and the motor running, or when on high gear, has to do with a considerable generation of frictional heat within the gear casing, which, together with the rapid motion of the parts, soon uses up any lubricant which may be there.

Some transmissions leak oil more than others, so that their demand for lubrication is greater than is ordinarily the case. The theory of the case is readily apparent to a man of mechanical bent, but it often is the reverse with a beginner, which is a sufficient reason why he should be duly impressed with the necessity for frequent lubrication of this important mechanism.

BODY RESEMBLES A BATH TUB

Hence the Name of the Successor to the Tonneau, Which Means a Little Tub—Characteristics of the Design.

To the French, the motoring public is indebted for that choicest bit of nomenclature—the noun tonneau, as applied to the hinder portion of an automobile. Its derivation, as everyone now knows, was plainly the result of ridicule heaped upon the little individual seats which used to be perched upon the rear corners of the early machines. Little tubs, they were in reality, and because of the foreign sound, all motorists have clung to the derisive "tonneau" ever since. In America, there also is the counterpart of the word preserved in the popular "bucket" seat, which is practically the same thing. But it remained for British genius to carry the suggestion of the original word to its ultimate limit by the adoption of the "bath" body. This is not a piece of Cockney humor, either, it should be understood, but real earnest. And the bath body is regarded as the height of motoring fashion just at present by those who pride themselves upon their up-to-dateness.

The accompanying picture shows in outline, one of the new bath bodies. It was made from designs originally promulgated in connection with the French Grand Prix of 1908, and is most seen on cars of very high horsepower just at present. Its reproduction on the inevitable smaller scale has taken place, however, and the idea may be expected to be copied more or less extensively. Outside of its being shaped in a general way like a huge bath tub, the bath body belies its name. Its very intent is not that of deluging its occupants, but of protecting them from the showers of mud which many of the lower and lighter types of body are so effective in producing. The particular example here reproduced, has but one point of ingress and egress, which is on the left side of the vehicle. It is a side door, which may be used after one half of the front seat has been folded out of the way. The rear of the body is occupied by a wide and rather luxurious seat, despite its low back, while for the front, the driver is given a bucket seat of the usual form, and his companion a sort of wide shelf—which seat must be folded up in order to permit entrance to the rear, or in fact to give access to any other portion of the interior.

Novel Points in Coil Construction.

Mounting the coil directly over the cylinders of the engine is an advance in ignition systems which has been recently brought out in England. The coils are of special construction to resist the heat to which they are exposed and their close proximity to the engine has for its object the reduction in length of the high tension circuit whose insulation has been found difficult to maintain. A single vibrator serves for all coils and a reversing switch permits the direction of flow of the current to be altered in order to preserve the contact points of the vibrator. Although there are two vibrators, strictly speaking, there is but one in action at a time and either may be put in circuit at will. One furnishes an intense spark which conduces to easy starting, while the other, in which the current consumption is smaller, is suitable for firing the engine at normal speed.

Air Cooling Best in Arctic Regions.

When it gets 72 degrees below freezing and to expose an ear to the cold for even half a minute means that it is likely to break off like a delicate piece of brittle white china, there are difficulties about running an automobile, but H. H. Ross operates a car between Fairbanks and Fox, Alaska, in such a temperature, the machine making two round trips almost every day. The distance between the towns is 12 miles, and a six-cylinder Franklin is used in the service, the air cooling feature of its construction making it peculiarly adaptible for "farthest north" motoring.

Advantages of Full Elliptic Springs.

A novel argument is advanced by the advocates of the full elliptic spring as to the advantages to be gained by its use. Full elliptic springs range in length from 36 to 40 inches, and it is asserted that a semi elliptic spring 7 feet in length is required to absorb the same amount of road shock. That is, the former type must be twice as long, and as hung in many cars it can take and absorb shock only in a vertical direction. By reason of their shape and tilting full elliptic springs are claimed to assimilate shocks from all directions.

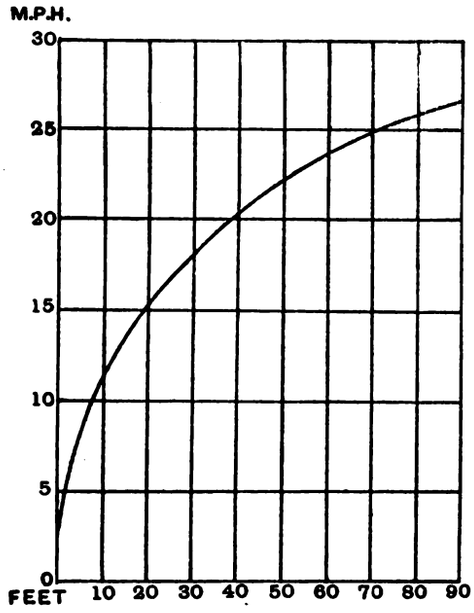
APPLYING BRAKES TO THE LAW



British Court Accepts Novel Method of Interpretation—Results of Braking Tests Admitted as Evidence.

Brisk warfare continues to be waged between the motorists, the police and the courts of Great Britain over interpretations of the expression "driving to the common danger," which is the accepted turning point about which hinge all questions of speed violation. Occasionally most original methods are adopted in attempted refutation of the allegations of the complaining police, and not infrequently interesting information is brought to light in this connection. Thus in a recent instance, partisans of an arrested owner who had been charged with driving to the common danger over a curved stretch of road, after ascertaining the precise distance from which a driver on any part of the curve could observe obstructions ahead, proceeded to a test of the braking, or "pulling-up" powers of the same car, thereby proving to the satisfaction of the court that no element of danger had been involved in the speed at which it was alleged the machine was traveling at the time of the taking of evidence. A dismissal was secured on this ground.

Braking tests of the car in question—a Rolls-Royce—were conducted over a measured stretch of the road and at various speeds, as a result of which a curve was plotted showing the stopping powers of the machine at any speeds within the maximum and minimum limits chosen. According to these determinations, when going at its maximum observed speed of a little under 27 miles per hour, a complete stop could be made in just 90 feet. At 25 miles an hour, 70 feet were required to stop; at 20, 39 feet; at 15, 19 feet; and at 10 miles an hour, about 8 feet. By measurement, it was determined that the minimum distance at which objects ahead on the curve could be seen was about 137½ feet. The police charge was that at the time of observation, the car was proceeding at a rate of 22½ miles per hour. Reference to the experiments mentioned, brought out the fact that at 22½ miles an hour, the same machine could be brought to a full stop in 53 feet or less, which would still leave some 80 feet to spare, supposing that the driver were to apply the brakes on the instant of coming into view of the hypothetical obstruction which formed the basis of the police case.

The graph obtained from the brake tests in this connection is reproduced herewith and is useful in calling attention to a subject which has escaped general notice for some little time. Indeed, although a number of different tests conducted both here and abroad several years ago sufficed to answer the then mooted point as to whether the automobile was as controlable, relatively speaking, as the horse-drawn vehicle, the furtherance of such investigations with the idea of trying out various systems of braking application or of braking materials, never has been sought. In this connection, it may be observed, that such determinations should prove of considerable importance in influencing design, even though the present braking equipments as a rule may appear to be perfectly satisfactory.

The refutation of the police evidence in the speeding case referred to was of peculiar interest locally in that a previous case, in which another motorist driving a less powerful machine had been arrested charged with driving at a speed only a very little

greater than that charged in the present case, had gone against the defendant, he having made no effort to refute the police testimony. It also should be mentioned, that the timing in both instances was done from a bridge about mid-way of the measured stretch and probably was equally inaccurate in both instances. The success of the defense in this case is particularly enlightening in that it shows the open mind of the bench, as well as illustrating the breadth of construction which it is possible to apply to statutes in which no specific speed limit is mentioned.

How Motorists Lose Fuel in Paris.

In some of the Parisian garages a highly developed system of surreptitiously annexing the contents of fuel tanks on transient cars that are run in for the night is in vogue. By means of suction pumps the gasolene and cylinder oil is benevolently assimilated into the coffers of the garage keeper, a sufficient quantity being left in the tanks to enable the car to renew its journey for a few kilometers before it dies of starvation. The practice has grown to such proportions and fuel is so expensive in the French capital that locks are being fitted to filler caps.

BETTER LAW FOR PENNSYLVANIA

State Senate Passes Bill Embodying Some Recommendations of the Motorists—Features of the Measure.

After efforts extending over a period of several years, Pennsylvania is in a fair way of obtaining a reasonable automobile law, as such laws usually are construed. As a result of a conference between the governor, the interested law makers and other State officials and representatives of the Pennsylvania Motor Federation, the bill drafted by the latter was withdrawn and some of its desirable features embodied in the measure fathered by Senator Grim and this compromise bill has been passed by the Senate and there is every prospect that it will be concurred in by the House, as Representative Townsend, who had introduced a measure into that body, has stated that it will be abandoned in favor of the Senate bill.

The compromise act increases the annual license fee from $3 to $5 and $15, but it exempts non-residents for a period of ten days, and also increases the speed limit from 20 to 24 miles per hour. The right to trial by jury and to deposit an automobile as bail also is provided for and all fines are to be paid into the State Treasury instead of to the local municipalities in which they are imposed, a move designed to discourage petty persecution for revenue only. The non-resident exemption will apply on a reciprocity basis, that is to say, only to the residents of such States as similarly exempt the residents of Pennsylvania; it is particularly aimed at New Jersey and Maryland.

The Grim bill creates three classes of licenses and fees, viz.: Class A—Cars less than 20 horsepower, $5. B—Cars over 20 and less than 50 horsepower, $10. C—Cars over 50 horsepower, $15. Motorcycles $2. The other chief provisions are as follows:

Operators must be over 17 years of age.

Non-residents are exempt for ten days.

Operators using cars not their own (joy riders), or an intoxicated person, are liable to a fine of $100, or six months' imprisonment, or both, and forfeiture of license.

Speed limits—Where buildings are less than 100 feet apart 12 miles per hour; where more than 100 feet apart 24 miles an hour.

Arrests can be made without warrant and the machine held in lieu of bail if the operator is the owner or using with owner's consent.

Penalty for first offenses not less than $10 nor more than $25; second offense, not less than $25 nor more than $50; third offense, not less than $50 nor more than $100 and 60 days' imprisonment.

The right of a trial by jury is given to offenders if desired.

Revenue from licenses retained by haghway department for improvement of roads.

Fines and penalties are retained by city, borough or township where offense occurs, for use of roads.

Law to go into effect January 1, 1910, when all conflicting local laws and rules shall cease.

RAPID INCREASE IN REGISTRATION

Average Yearly Gain of More Than 33,000 Since 1905—Figures Showing Where Big Strides Have Been Made.

A recent compilation of registration statistics for the various states covering the past four years, shows that the average gain in registration during the interval from 1905 to 1908 has been more than 33,000. From 1905 to 1907, the totals increased from 29,167 to 75,204, a gain of 46,037, and from 1907 to 1908, the increase was from the former amount to 128,283, of a difference of 53,079, which is more than the gain for the entire period of the two years previous. A large proportion of the recent gains is seen to have been due to gains in the western States, and though the record is incomplete in this respect, since it does not take into account registrations previous to last year in a number of instances, it is useful as presenting at least an approximation to the true state of affairs.

In this connection it is specially noteworthy that Pennsylvania, New Jersey and Massachusetts forged ahead of New York State last year in the matter of registrations, as did Pennsylvania and New Jersey the year preceding. Rhode Island, Indiana, Iowa, Nebraska, South Dakota and Oregon, are other States in which the rate of gain during the past two years has reached significant proportions. The record in detail is as follows:

States.	1905.	1907.	1908.
Maine	737	853	904
New Hampshire	702	517	565
Vermont	....	449	657
Massachusetts	9,587	6,515	17,500
Rhode Island	....	840	1,047
Connecticut	....	2,093	2,810
New York	8,625	13,985	15,480
New Jersey	....	17,619	21,948
Pennsylvania	....	15,422	25,179
Delaware	....	....	881
Maryland	655	1,496	1,691
Virginia	....	717	648
Florida	133	184	243
Tennessee	369	366	462
Ohio	....	....	11,030
Indiana	....	1,612	4,109
Michigan	....	....	7,500
Illinois	....	....	6,376
Wisconsin	1,493	1,481	2,045

Missouri	....	2,000	874
Nebraska	572	1,053	2,141
North Dakota	....	....	214
South Dakota	358	314	724
Utah	....	212	300
California	4,728	5,241	5,558
Oregon	219	278	559
Totals each year..	29,167	75,204	128,283

Boston Organizations Fail to Merge.

The differences of the Bay State Automobile Association, and the Boston Motor Club which have been aired in the public prints for some time have culminated in a final separation by mutual consent. Members of both organizations have been trying to effect a reconciliation since the first outbreak occurred, and for a time prospects were bright that the warring factions would come to terms and the dove of peace would again reign in the disrupted organization. But after several conferences between representatives of the contesting parties, at which various compromises were suggested, the Bay State A. A. refused to accede to the demands of the Boston Motor Club. At a meeting of the motor club last week the report of the conference committee was accepted and it was voted to become a permanent organization as soon as the necessary formalities can be complied with. It was decided to apply for a charter and the following temporary officers and incorporators were appointed: E. A. Gilmore, president; J. B. Sullivan, Jr., vice-president; E. P. Webber, secretary; A. B. Henley, treasurer. Directors, Maj. H. G. Kemp, H. H. Love, A. E. Adams, A. P. Teale, Kenneth Skinner and R. R. Ross. A ticket of permanent officers were nominated, the election to be held at the next monthly meeting.

Middletown Motorists Organize.

Forty owners of motor cars in Middletown, Conn., met at the home of one of their number last week and tentatively organized the Middletown Automobile Club. Considerable enthusiasm was manifested and the work of drawing up a constitution and by-laws was put up to the following committee: Rev. Ellis Bishop, chairman; Frank D. Haines, Charles A. Coles, E. Dyer Hubbard, A. H. Bishel, and Dr. J. E. Loveland. They will report at a subsequent "get-together' of those interested.

N. Y. A. C. Automobilists to Dine.

Boasting a roster of no less than 600 motorists on its membership list, the New York Athletic Club is to take official cognizance of the fact for the first time on the 31st inst., when an automobile dinner will be held to signalize its peculiar strength in this respect. The occasion will be honored by the presence of such speakers as Job E. Hedges, Senator Slater, Judge Zellar and Mr. Loeb, formerly confidential secretary to President Roosevelt.

Colorado Club to Promote Good Roads.

Automobile owners of Glenwood Springs, Colo., have formed the Glenwood Springs Good Roads Association. Charles W. Darrow was elected president and George J. Hally secretary. The club's main endeavor will be to promote the cause of good roads.

Harrisburg Club Plans for Two Homes.

Two club houses—a city and country rendezvous—are acquisitions which the Harrisburg (Pa.) Motor Club is making strenuous efforts to possess and from present indications they are not far from the goal.

"The A B C of Electricity." Price, 50c. The Motor World Publishing Co., 154 Nassau Street, New York City.

RAW MATERIAL FOR CHAUFFEURS

Amazing Ignorance Betrayed by Candidates for Employment—Gems from a British Club's Examination Papers.

Applicants for drivers' certificates from the Royal Automobile Club of Great Britain are required in addition to the road test to determine their proficiency in handling a car, to pass a written examination on technical subjects relating to the construction and care of the car. Some of the answers submitted by the ambitious candidates indicate the extent of their knowledge of motor cars and afford full justification to the club in its efforts to protect the owner from the incompetent driver by licensing only those who prove themselves capable of operating and caring for a car.

If a written test is productive of the results given below, the car in the hands of such drivers, when confronted with actual conditions well may be the object of solicitude. Following are some of the "gems" which were expected to be of material assistance in securing the coveted license:

"If the water circulation were to stop, what part of the car would suffer?"

Ans.—"The accumulator would be strained."

"What is compression for?"

Ans.—"Compression is the power that drives the crooked shaft."

"What insulates low tension magneto plugs?"

Ans.—"A white dough kind of stuff."

"What is the radiator intended for?"

Ans.—"The radiator is fitted to the car so that the starting handle can be fitted to it."

"What is a silencer for?"

Ans.—"A silencer is to keep the engine running; the engine would stop if the silencer were removed."

"If an engine was run short of oil, what part would suffer?"

Ans.—"The female part of the clutch would be ruined."

"How can compression be lost?"

Ans.—"Through the accumulators running down."

London "Sports" Affect "Motory" Attire.

Where "horsey" clothes used to proclaim sporting proclivities and disposition toward the most advanced fashions, the tendency is now toward "motory" clothes, according to a well known "sporting" tailor of Regent street, London. "Nowadays," he declares, "the popularity of horses for fashionable purposes is somewhat declining, and the poor but vain young man likes to be in the mode. He accordingly wears a motor coat, motor leggins, and a motor cap with ear flaps. People who do not know him think he is a motorist, maybe—but sometimes take him for a chauffeur."

EXCLUSION LAW FOR MT. DESERT

Townships on the Island Empowered to Close Their Roads to Automobiles—Provisions of the New Statute.

After much local agitation which, in the course of the two seasons during which the conflict has raged has created more or less of a stir throughout the country, the bill providing for the exclusion of automobiles from Mount Desert Island, adjoining the coast of Maine, has been passed by the legislature and has received the signature of Governor Fernald. It only remains for the measure to be ratified by the voters of the townships of Mount Desert, Bar Harbor, McKinley and Tremont, at special town meetings to be held early in the summer. As more than half the voters of the island petitioned for the passage of the bill, including a number of temporary summer residents, among whom a former president of the Automobile Club of America was numbered, it is not likely that the measure will fail to go into effect. In substance, the bill provides:

First—That no motor vehicle shall be used on any highway within any of the four townships on the island of Mount Desert.

Second—That whoever so uses a motor vehicle shall on first conviction pay a fine of $20 and costs, and on every subsequent conviction shall be punished by a fine of $50 and costs, or by imprisonment for not more than 60 days, or by both fine and imprisonment.

Third—That duly authorized steam rollers shall not be deemed motor vehicles.

Fourth—That the act shall take effect in any township on the island ten days after it shall have been accepted at any legal meeting of such township.

New Jersey's Latest Grab Opposed.

Resolutions protesting against the diversion of $128,000 of the funds now in the hands of the Motor Vehicle Department of the State of New Jersey for the general expenses of the State were passed at a meeting held in Newark last week under the auspices of the Associated Automobile Clubs of New Jersey. Among those present were representatives from the boards of trade of Newark, Jersey City, Paterson and Passaic, together with a delegation from the New Jersey Automobile Trade Association. The meeting also went on record as opposed to any disposition of the automobile license funds for purposes other than highway maintenance, and further declared by resolution that the bill compelling all vehicles to be lighted at night ought to be reported out of committee and placed upon the calendar of the legislature for immediate passage.

Check on Passer of Bogus Checks.

Robert Forrest, who is said to have used fifty or more aliases and to have made a specialty of swindling real estate and automobile dealers, is under arrest at Oak Park, Ill. Forrest's trick was to call on the dealers and represent himself as a wealthy visitor to the city, giving as his address the home of some prominent citizen or first-class hotel. He then would begin negotiations for the purchase of a costly car or an expensive real estate site or residence. When the deal was closed Forrest would tender in part payment a check on a local bank. His victim would call up the bank and find that Forrest had a deposit there. Then before the check could be cashed Forrest would appear at the victim's office, tell a story about losing his purse and ask to have a check cashed. Usually the victim readily gave the money. Then Forrest and his bank account, it is said, mysteriously disappeared. Forrest is reputed to have operated this bunco game for many years in all parts of the country.

Colorado Clubs in a Merry War.

A merry war for recognition by and affiliation with the A. A. A. has sprung up between the Colorado Automobile Club and the Denver Motor Club. The Colorado A. C. is the pioneer organization and for four years has been affiliated with the national body, but now the new aspirant is contesting its right to the honor. Through the rapid building up of a membership of over 400, and its brilliant and successful management of the Denver show, the Denver Motor Club has taken a leading place in the motor councils of the State. Its claims for recognition are based on the ground that the old organization has not the requisite membership of 100 to entitle it to representation with the governing body, and it points to its own record as justification of its efforts to secure recognition as the representative body of automobilists in the Centennial State.

Savannah Club Reelects Its Officers.

Being well satisfied with the conduct of its affairs by the present executives, to whose energetic efforts the successful management of the Grand Prize race was in large measure due, the Savannah (Ga.) Automobile Club at its recent annual meeting re-elected all the old officers as follows: Frank C. Battey, president; J. J. Raners, vice-president; A. W. Solomon, secretary and treasurer. Board of governors, F. C. Battey, J. J. Raners, A. W. Solomon, George W. Tiedeman, George J. Baldwin, Harvey Granger, F. M. Oliver, C. G. Bell, D. G. Rosenheim, Wright Hunter and A. B. Moore.

Special Sermons for Automobilists.

Special sermons to automobilists are a church advertising novelty that Dr. William Horace Day, of Los Angeles, Cal., has originated. The registered list of owners is used for sending out the invitations, and the text employed is: "The driving is like the driving of Jehu, for he driveth furiously."

MUD THROWING EFFECTS OF SPEED

Results of Tests Showing the Splashing Capacity of Motor Cars—What They Suggest for Motorists.

Tests recently conducted by a Belfast motorist to ascertain the capacity of the motor car to throw mud, were productive of interesting results. The road on which the tests were held was swept on the previous evening. In the morning the surface was sprinkled to give approximate conditions to those which attain in wet weather. A screen 8 feet wide and 6 feet high was constructed and placed on the sidewalk to record the results. For the first trial a car traveling 15 miles per hour was sent past the screen at a distance of 3 yards, and the resulting volume of mud thrown on the screen averaged 1 foot in height. The maximum height of the mud thrown by the car at this speed was 18 inches. At a car speed of 20 miles per hour the column of mud was pushed up to a height of 3½ feet. In the final trial the car was sent past the screen at 25 miles per hour, when the mud was elevated to an average height of 4 feet and attained a maximum of 5 feet 11 inches. The net result demonstrated that at 25 miles per hour pedestrians are practically certain to be splashed and that as the speed of the car increases, immunity from flying mud becomes unknown. No effort was made to determine how far mud is likely to be thrown under such circumstances.

As the tests showed the wide area in which mud was thrown by cars at speed it would evidently be a kindly act on the part of motorists to decrease their rate of travel in passing through towns or whenever pedestrians are encountered on muddy highways. Such action on their part would merit the esteem of the public.

Cheyenne Launches Its Motor Club.

Twenty-five enthusiastic motorists of Cheyenne, Wyo., met last week and formed an organization to be known as the Cheyenne Motor Club. Officers were elected as follows: William B. Barnett, president; J. E. Stimson, first vice-president; Dr. Otto Snyder, second vice-president; Fred Horn, secretary and treasurer. The following committee were authorized to prepare a constitution and by-laws and to report at the next meeting: W. E. Dineen, Frank Wright, John Schuneman, L. E. Smith and Percy Hoyt.

Newark's Big Club Grows Bigger.

As the result of an active campaign to enlarge its roster, the New Jersey Automobile and Motor Club of Newark, at a recent meeting increased its numerical strength by the admission of 47 new members. The club now has 1,196 active and 232 associate members on its roll.

The Week's Patents.

903,762. Automobile. Charles J. Paulson, Brooklyn, N. Y., assignor of forty-three one-hundredths to Kenneth F. Junor and thirty-seven and one-half one-hundredths to Phebe R. Maclaurin, Brooklyn, N. Y. Filed Oct. 19, 1907. Serial No. 398,142.

1. In a motor vehicle, the combination of a spring member, a motor connected with one end of the spring member, the other end of the spring member being connected with the driving wheels whereby the motor will wind up the spring and thereupon rotate the driving wheels through the spring, a governor connected with the driving wheels, means for causing the governor upon reaching a certain predetermined speed to reduce the power of the motor, mechanism connecting the motor with the driving wheels separate from the said spring connection, said latter mechanism including a connecting member that is normally inoperative and disconnects such mechanism, but which upon attaining a certain predetermined speed will throw such mechanism into engagement and thereby through said motor connection with the spring end will wind up the spring through the rotation of the driving wheels caused by the momentum of the car, assisted by the reduced power of the motor.

903,884. Motor Vehicle. Arthur Przygode, Charlottenburg, Germany, assignor to General Electric Company, a Corporation of New York. Filed Oct. 13, 1905. Serial No. 282,539.

1. A motor vehicle comprising a fore car, a rear car, a pivotal connection between the cars, and a device having an attachment to each car which checks the angular movement of one car with respect to the other.

903,952. Transmission Gearing. William K. Blackburn, Milwaukee, Wis. Filed July 31, 1908. Serial No. 446,247.

In transmission gearing, a power shaft, conical clutch members secured to the power shaft, oppositely disposed beveled faced pinions loosely mounted upon said power shaft and having conical shells extending therefrom for frictional engagement with said clutch members, means for holding the bevel faced pinions against end play upon the aforesaid power shaft, a counter shaft, a beveled faced wheel carried by the counter shaft adapted to have constant engagement with both of the aforesaid bevel faced pinions, and means for imparting longitudinal motion to the power shaft whereby the bevel faced pinions are alternately engaged by the clutch members.

904,023. Vehicle Wheel. Thomas A. Silverwood, London, England. Filed April 22, 1907. Serial No. 369,647.

A vehicle wheel comprising an expanding frame, a hub and spokes, one end of each spoke being connected to the hub and the other end being free to move in the frame, springs, one of which is attached to each of said spokes, and spring buffers connecting with said springs, substantially as described.

904,028. Self-Propelled Vehicle. Joseph Vollmer, Berlin, Germany, assignor to General Electric Company, a Corporation of New York. Filed Jan. 16, 1905. Serial No. 241,271.

1. In a system of the character described, the combination of a fore-car, a rear car, an elastic suspension means for the body of the fore-car, and a second elastic suspension means located between the first suspension means and the rear car and supporting the weight of the latter.

904,086. Internal Combustion Engine. David Roberts, Grantham, England. Filed Nov. 9, 1907. Serial No. 401,488.

1. In an internal combustion engine, the combination with the cylinder, and piston, of a vaporizing chamber communicating directly with the cylinder by a passage of less diameter than the cylinder, a fuel inlet connected with the vaporizing chamber, in

direct and open communication therewith, air inlet and exhaust passages communicating with the said passage, and controlling valves interposed between said passage and said inlet and exhaust passages, substantially as described.

904,132. Motor Oiling System. Kirk G. Johnston, New York, N. Y. Filed March 5, 1908. Serial No. 419,357.

1. In a motor oiling system the combination with the crank case thereof and using the force of the successive compressions therein, of an adjustable oil level maintaining stand pipe connected to an air-tight oil tank, adjustable check valves hermetically attached to and adapted to receive oil from the said air tight oil tank and means conveying oil from said adjustable check valves to the required points on the motor, substantially as and for the purpose set forth.

904,137. Steering Mechanism for Automobiles. John M. Mack, Allentown, Pa. Filed Nov. 27, 1905. Serial No. 289,143.

1. A steering apparatus for vehicles comprising a casing, a shaft supported partly within and partly without said casing, an arm fixed upon said shaft without the casing adapted for connection with the steering gear, an arm fixed upon said shaft within said casing, a movable member having a bifurcated end adapted for sliding engagement with said arm, and a threaded end, means for guiding said movable member, a sleeve inclosing the end of said movable member and provided with screw threads adapted to engage the threaded end of said movable member, an annular support arranged upon said sleeve intermediate its ends, bearings disposed above and below said support, and a rod secured at its lower end to said sleeve and provided at its upper end with a hand wheel for actuating said rod and its connected parts, substantially as specified.

904,143. Wheel for Motor Vehicles. Alden L. McMurtry, New York, N. Y., assignor to Wyckoff, Church & Partridge, a Corporation of New York. Filed Dec. 11, 1906. Serial No. 347,390.

1. A wheel comprising a felly recessed in its outer face, a removable wheel rim formed with longitudinal locking recess in its inner face, a pivoted rim locking device seated in the recess in the felly and adapted to be moved from a tangential to a radial position to engage the locking channel in the rim.

904,146. Steering Mechanism for Motor Vehicles. Arsene Pare, Taunton, Mass. Filed April 2, 1908. Serial No. 424,758.

A motor vehicle comprising a running gear frame, stub axles having vertical arms journaled in bearings on the forward portion of said frame, steering wheels on said axles, a gear segment affixed to one of the axle arms, connections between the two axle arms, a vertical shaft journaled in a bearing affixed to the running gear frame, a gear affixed to said vertical shaft, and engaged with said gear segment, a spiral gear rotatively mounted on the body, and having a socket portion which is adapted to slide on the vertical shaft, the socket portion of said spiral gear and the portion of the shaft on which it slides being relatively formed to prevent one from rotating relatively to the other, a steering shaft mounted on the body, a transverse shaft and a longitudinal shaft, both journaled in bearings on the body, gears connecting the transverse shaft with the longitudinal shaft, and a spiral gear on the longitudinal shaft meshing with the spiral gear which slides on the vertical shaft.

904,148. Lever and Ratchet for Vehicle Brakes. Morgan Potter, Fishkill-on-the-Hudson, N. Y. Filed March 6, 1908. Serial No. 419,443.

1. In a lever and ratchet appliance for vehicle brakes, an operating lever, a pawl and a ratchet, said lever being supplied with a stop piece arranged to engage the lower portion of the pawl and with a collar for entering a recess in the pawl, and a coupling bolt passing through the collar and through the pawl, the parts being combined and arranged substantially as set forth.

904,150. Garment, Umbrella, and Cane Rack for Automobiles. Edward T. Robinson, St. Louis, Mo., assignor to St. Louis Car Company, St. Louis, Mo., a Corporation. Filed Feb. 11, 1908. Serial No. 415,356.

1. A rack of the character described, comprising a horizontal bracket having a horizontal loop and adapted to be secured to the body of a vehicle, and a stay arm extending upwardly and inwardly from the inner end of said loop, substantially as set forth.

904,151. Hood for Automobiles. Edward T. Robinson, St. Louis, Mo., assignor to St. Louis Car Company, St. Louis, Mo., a Corporation. Filed Feb. 11, 1908. Serial No. 415,359.

1. A hood of the character described comprising a plurality of tapering telescoping sections.

Matheson

ANOTHER VICTORY

Two Matheson Cars WIN

TWO PERFECT SCORES

in New York to Boston Endurance Contest, March 11th, 247 miles—6 hours, 34 minutes running time, carrying four passengers over deep mud-covered roads, considered, in many places, almost impassible. 20 contestants.

These two perfect score Matheson four-cylinder cars had been driven by their owners over 15,000 and 19,000 miles respectively before entering this contest.

This victory recalls the great Cup Winning triumph of three Matheson cars which were the **only three** cars out of **32 contestants** to make **perfect time scores** in the greatest Endurance Contest ever held in America—300 miles in zero weather, over the ice and snow covered mountain roads from Philadelphia to Wilkes-Barre and return, Jan. 1-2, 1909. These three winning Mathesons had also been driven by their owners 9,000, 12,000 and 18,000 miles respectively before entering the contest.

SUPPLEMENTARY SPIRAL SPRINGS

¶Cars are like men in that it takes a study of them to realize their possibilities.

¶We have made a study of the spring question and can help you realize to the full the easy-riding possibilities of your car. The use of Supplementary Spiral Springs are a duty you owe to yourself. They provide spring insurance and spring comfort, effectually guarding against shocks to your pocketbook and passengers.

¶Many thousands of the S. S. S. are in use by just as many satisfied users. Better be one of them NOW.

¶Your dealer or garage can fit you out in a few hours' time.

SUPPLEMENTARY SPIRAL SPRING CO.

The Most Efficient Battery is the

WITHERBEE

It is used and recommended by practically all the leading manufacturers and dealers. This fact is an acknowledgment of its superiority. Not alone is it a perfect system of ignition, but is absolutely necessary as part equipment of every car for the reason that it provides current for

Limousine Lighting, Head Lights, Tail Lights, Side Lights, Inspection Lamp, Gauge and Oil-Feed Lights, and every use to which a storage battery can be put

Unless your car has perfect lubrication, your gasoline is used for friction instead of miles of speed. The use of vacuum MOBILOIL saves the wear of your car, the waste of gasoline, and most of the money that goes for repairs.

Vacuum MOBILOIL is made in six different grades to suit the lubrication of every automobile made. One of these grades is exactly adapted to the needs of *your* car. Its use is an investment that saves expense. It will end forever your lubrication troubles, and add to your pleasure and the life of your car.

Write for free booklet showing grade of MOBILOIL adapted to the use of every car. Gives track records to date, and money-saving motor hints.

Vacuum

MOBILOIL

"THE SILENT SELDEN"

$2,000 F. O. B. ROCHESTER, N. Y.

AFTER the remarkable results of our "first year"—the achieved success of 1908, we salute you with real and well established confidence as we introduce the Selden of 1909.

Not only has our promise to produce a high grade car of best materials and workmanship for $2000 been strictly fulfilled, but we have demonstrated the Selden genius in a silent, strong, comfortable, durable and handsome car. It does all that the owner wants to do and all that the chauffeur ought to do. Agents and owners are enthusiastic over it. Not a cheap car at all but one of the how-can-you-do-it-for-the-money kind.

Our 1909 wheel base is lengthened 5 inches from 109 to 114; the magneto and pump moved to left side of motor, the remaining equipment on the right; the brakes enlarged and now rigged inside the frame; the wheels now 34 inches were 32 inches; the radiator and hood made to conform in style to longer wheel base—little touches for style and convenience. No radical mechanical changes, simply because we couldn't find any necessary—no use fooling with what has proved so unusually good.

We can assure those who buy the 1909 Seldens all the efficiency of the 1908 Seldens with a little more style and a little more convenience, a little more refinement. The actual records of use and travel this year have so proven their merit, power and economic stability that it would be hard to promise anything better in practical construction.

THE COMING CAR OF MODERATE PRICE

Catalog and Agency Proposition upon Request. Agencies Wanted Everywhere.

Matheson

ANOTHER VICTORY

Two Matheson Cars WIN

TWO PERFECT SCORES

in New York to Boston Endurance Contest, March 11th, 247 miles—6 hours, 34 minutes running time, carrying four passengers over deep mud-covered roads, considered, in many places, almost impassible. 20 contestants.

These two perfect score Matheson four-cylinder cars had been driven by their owners over 15,000 and 19,000 miles respectively before entering this contest.

This victory recalls the great Cup Winning triumph of three Matheson cars which were the **only three** cars out of **32 contestants** to make **perfect time scores** in the greatest Endurance Contest ever held in America—300 miles in zero weather, over the ice and snow covered mountain roads from Philadelphia to Wilkes-Barre and return, Jan. 1-2, 1909. These three winning Mathesons had also been driven by their owners 9,000, 12,000 and 18,000 miles respectively before entering the contest.

50 H. P.
Six-cylinder Shaft Drive
$3,000
Equipped with choice of Touring, Tourabout, Toy-tonneau, Close coupled or Runabout bodies.

50 H. P.
Four-cylinder Chain Drive
$4,500
Equipped with Touring body, Limousine or Landaulet, $5,500. Roadster or Tourabout, $4,350.

MATHESON AUTOMOBILE COMPANY
1886-1888 Broadway, Cor. 62d Street New York City

MILLER'S Anti-Freeze Compound

DIRECTIONS FOR USE.

The radiator should be thoroughly washed out with hot solution of caustic soda, which will remove any dirt, and then clean water should be put in to see if the radiator leaks any place.

If the radiator is found not to leak, put in the solution. To get a mixture that will not freeze at 15 degrees below zero, Fahrenheit, add ten pounds of the compound to two gallons of water. To get a solution that will not freeze 30 degrees below zero, Fahrenheit, add ten pounds of the compound to every six quarts of water.

The cover on the can should be kept closed tight at all times while it contains any of the compound.

Price, 10-lb. cans..... $1.00 each.

Pan-American Automobile Body Polish

Pan-American Polish was awarded the Bronze Medal ("the only one awarded") at the Louisiana Purchase Exposition at St. Louis, 1904. This polish has been carefully prepared for the Automobile trade. It is also applicable to the carriage trade, or can be used on any varnished furniture or wood-work of any kind. It will remove stains, cover scratches; leaves the automobile with its original new lustre without being sticky or greasy.

It can be used on the leather seats or tops with the very best results. Can be used on any color or kind of varnish from the clearest white to the darkest black. Furnished in eight-ounce bottles.

For sale by all automobile dealers.

Price, 60 cents per 8-oz. bottle. Price, $3.00 per gallon.

Special prices quoted manufacturers, jobbers and dealers. Catalog on request.

Studebaker MOTOR CARS

Why Do Studebaker-Garford Cars Sell Faster, For More, Than Others?

HAS IT EVER OCCURRED TO YOU that the Studebaker-Garford gasoline cars command a higher price per horsepower than any other American cars? Perhaps it hasn't—not all persons understand cars well enough to compare them on that basis. Most folks are impressed with large figures—to them 50 or 60 or 70 horse power terms seem to appeal strongly—tho for the life of them they couldn't explain just why.

EFFICIENCY IS THE ONLY LOGICAL BASIS for comparison of an automobile or a horse or anything else. Funny how few appreciate that simple fact. Must be it's so simple they have forgotten it.

ONE HUNDRED DOLLARS PER HORSE POWER is the price of Studebaker-Garford 30s and 40s. Thirty sells for $3000 and the Forty for $4000—just an even hundred per horse power you see. (Of course that's with standard touring car body. Limousines and other special types come higher according to equipment.)

A LITTLE LESS THAN A MILE A MINUTE is the limit of speed of the 40 with seven passengers, and the 30 has about the same speed with its five. They are not racing cars and several other high priced cars can give a more spectacular demonstration on a good road—for a ways.

IF YOU WANT A RACING CAR we will be glad to recommend to you several concerns which make that kind of machine. We don't. Studebaker-Garford cars are built for that class of judicious buyers who are content with reasonable speed but who demand the best that can be produced in comfort and luxury—and of course absolute reliability under all conditions.

PERSONS WHO BOAST of covering a few hundred miles "without trouble" are not owners of Studebaker-Garford cars. Thousands of miles—two or three seasons of constant hard driving without any mechanical trouble—often without even an adjustment—are matters of course with owners of these cars. That's what they pay for. That's why Studebaker-Garford cars not only command a ready market at higher prices than other cars of same horse power, but there's a big shortage in our Models A and B today.

NOW IT DOESN'T SOUND TRUTHFUL to say that the Studebaker-Garford "30" for example, selling at $3000 is higher priced than any other "30"—for everybody knows there are several cars rated at "30" in the ads and which sell for $4200 to $5000.

BUT THOSE ARE "30s" ONLY IN NAME—according to the same formula which rates the Studebaker-Garford at 30 these others are more nearly 60. Lowest of them is 47 and one prominent example of the prevalent underrating fad should develop 58. Of course we cannot vouch for its developing that much—it doesn't agree with our ideas of design or construction and so we don't believe it will on a test.

WE HAVE OFTEN WONDERED if the real reason for thus underrating high priced cars was to obscure the fact that 50 and 60 horse power cars of other makes continually go down in defeat before the 30s and 40s of the Studebaker-Garford line. Could it be, think you?

MORE ROUGH ROADS RECORDS—covering distances like the famous drive from New York to Fort Leavenworth; the winter run from Chicago to Denver—when the 30 beat the crack European and American in the Round the World Race, by six days—stand to the credit of cars of this wonderfully hardy strain than are held by models of any other make.

WHY DO BUYERS GLADLY PAY MORE per horse power for Studebaker-Garford cars than they will pay for others of the same horse power or even for cars rated much higher? Must be a reason. And it must be a good reason, for rattle-brained folks don't buy Studebaker cars—they run after something more spectacular or more "original"—which is to say, experimental.

ASK ANY STUDEBAKER-GARFORD OWNER; he'll tell you in a word. It's because of the higher efficiency. Regardless of rating these cars excel in year-in-and-year-out performances. You never see one advertised for sale second hand. If an owner wants a newer model he always wants a later one of the same make. So he brings his old car to us—for, better than anyone else we know and appreciate its value.

LET'S SEND YOU A LIST of owners of Studebaker-Garfords—men of prominence who have driven their cars three and four and five years—and let their verdict determine your choice. Isn't that a good plan? We think so.

STUDEBAKER AUTOMOBILE COMPANY, Main Office: Cleveland, Ohio

Weed Cross Chains Are Brass Plated

When you buy chain tire grips insist that you get the genuine Weed brass plated and specially hardened cross chains. Buy only the BRASS PLATED ones—then you know you are getting the genuine Weed—not an imitation. The new hardening process, through which all Weed Cross Chains are put, enables the user to get two to three times the mileage formerly secured.

Since we could not improve the general design, neat appearance and simplicity of Weed Grips we have succeeded in improving the wearing quality of the cross chains.

MR. AUTOMOBILIST!

you should secure the benefit of this change; see that you do. Specify Weed Chain Tire Grips—and see that you get them.

WEED CHAIN TIRE GRIP COMPANY

28 Moore St. New York

The Warner Auto-Meter

1909 Style

Guaranteed Absolutely Accurate

is the only speed indicator made on the Magnetic Induction principle. Because of the principle it accurately indicates every range of speed from zero to the maximum.

All other instruments are made on the centrifugal principle. They fail to indicate any speed whatever under 5 to 10 miles per hour.

The Auto-Meter is so durably made that practical tests have shown that it will endure a MILLION MILES of riding without perceptible wear, or departing from absolute accuracy more than 10 feet to the mile.

We invite comparative tests. Before you decide on any Speed Indicator, put the Auto-Meter on one side of your dash and any other indicator at any price on the other. Then use your watch over a measured course. Keep the instrument which tells the truth. We know which it will be.

The Service and Selling Success of the Year is the

"Firestone"

NON-SKID TIRE

No other tire has ever appealed so sensibly to the motorist; no other has ever so effectively fulfilled its purpose. Its tough, all-rubber tread presents a mass of angles, edges and points of road-contact that PREVENTS skidding. Does away with all metal and other self-destroying features in tire construction that have hitherto made non-skids short-lived and unreasonably expensive in mileage cost.

THE TIRE TO USE—THE TIRE TO SELL

"Progressive Locomotion"

Every auto maker, dealer, owner and driver should send for this handsome new book (without any advertising), which illustrates the fascinating story of Vehicles, and of Rubber, from the crude to the perfection of today. Free upon request, stating size of tire used.

THE MARMON

"A Mechanical Masterpiece"

The "Thirty-Two" Roadster, $2400

Value, Not Venture

The marked mechanical perfection, the unusual durability, and the thorough dependability of Marmon cars have never been questioned by well informed, experienced motorists. For over fifty years, its manufacturers have enjoyed a world-wide reputation as builders of high grade mechanical products.

These facts will weigh heavily with the thoughtful buyer in considering the Marmon "Thirty-two." Light, powerful, and unsparingly equipped, it invites the most searching comparison with anything on wheels at $3,500 or less.

Motor, 4 cylinder, 4½ x 4½. Water-cooled. 32-40 H. P. Three-point support. Ignition, Bosch H. T. Magneto, dual system. Lubrication, Marmon system of automatic force feed through hollow crankshaft. Drive, straight line shaft. Selective transmission and rear axle one compact unit, very accessible. Large brakes, effective and very durable. Materials, absolutely the best of everything, including Krupp and Chrome Nickel Steels. Hess-Bright imported ball bearings. Tires, Q. D., 34 x 4. Wheel Base, 112 in. Weight, 2,100 lbs. Equipment, complete and high class. Bodies, Sheet Metal. Touring Car seats five; Suburban (detachable tonneau), seats four; Roadster seats two. Also Coupe or Limousine Town Car.

Marmon "Fifty" (Seven Passengers), $3,750.

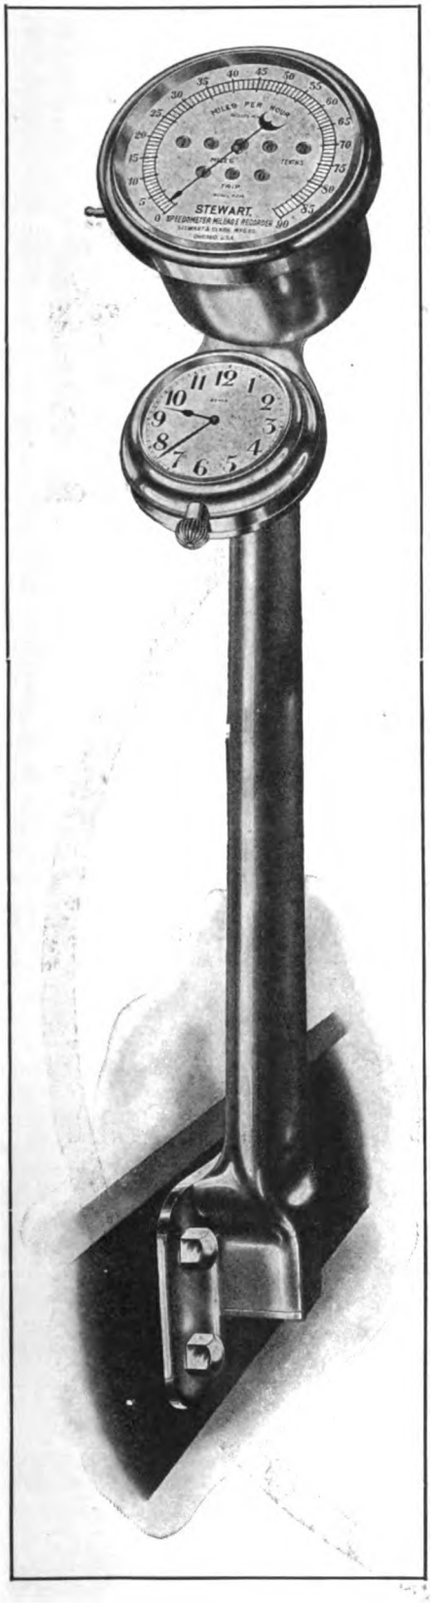
Chicopee Falls, Mass.

THE "JEWEL 40"

The Non-Skidding Car

SPECIFICATIONS



ENGINE—Rutenbur.
BORE AND STROKE—4⅛x5"
IGNITION—Double—Bosch Magneto, Connecticut Coil and Exide Storage Battery.
LUBRICATION—Self contained system with oil level pump in crank case.
TRANSMISSION—Selective type, 3 speeds forward and reverse.
BEARINGS—Timken Roller.
FRONT AXLE—One piece drop forging.
REAR AXLE—Full floating type.
WHEEL BASE—120".
WHEELS—36".
TIRES—Goodyear, Diamond, Firestone or Hartford, 36x4" front, 36x4½" rear.
BODY—Seven passenger.
WEIGHT—3,000 lbs.
PRICE—$3,000.00 complete with top, Hartford Shock Absorbers, Prest-O-Lite gas tank, 9" Rushmore Search lights, side lamps and tail lamp, double tire irons and trunk rack.

Rambler

The Car with the Offset Crank-Shaft.

Model Forty-four, 34 H. P., $2,250.
Spare Wheel, with Inflated Tire, Brackets, and Tools, $74. Magneto, $150.

TRY IT ON THE HILLS

Test this car at half-speed on a hill or sand road where power—and every ounce of it—is needed. Notice how steadily and powerfully it pulls when running slowly under load.

The capacity of the Rambler engine for doing this extra work is most noticeable at low engine speeds. This is because of the Offset Crank-Shaft.

All that power which in other engines is lost through friction on the bearings and cylinder walls is added to the driving force by the Rambler Offset Crank-Shaft. It reduces friction, eliminates hammer on bearings, gives more power. The Straight-Line Drive delivers the power direct and with least frictional loss to the rear axle.

Seven-passenger model, 45 horsepower, with Offset Crank-Shaft, $2,500. Other models, $1,150 to $2,500. A new Rambler catalog has just been issued. It describes and illustrates all distinctive features of new Ramblers—the Offset Crank-Shaft, Spare Wheel, Straight-Line Drive, etc. A copy on request.

THE MOTOR WORLD

Volume XIX. New York, U. S. A., Thursday, March 25, 1909. No. 26

WANT UNIFORM TRADE DISCOUNTS

Spark Plug Makers Propose a Scale for Jobbers and Dealers—Ignition Men in Conference.

Makers of ignition apparatus who are at the same time members of the Motor and Accessory Manufacturers arranged a series of conferences in New York City this week, looking to measures which will benefit their common trade interests. Among the most radical and important recommendations offered was one which was developed at the meeting of the spark plug manufacturers, and which contemplates a uniform scale of discounts to dealers and jobbers. Representatives of four prominent plug makers were present, including the Splitdorf Laboratory, A. R. Mosler, the Pittsfield Spark Coil Co., and the Janney-Steinmetz Co., with T. J. W. Kelly, of the Splitdorf organization, presiding as chairman. The meeting was held at the Hotel Cadillac on Tuesday morning, 23d inst., and was the first of the series. Various suggestions for standard plug sizes and other improvements were discussed, but the chief interest centered about the proposal for fixed and uniform discount figures for the trade.

So seriously was the matter taken up that the devising of contract forms that would adequately protect a uniform discount system was given consideration. As a result it was decided to take counsel with the legal advisers of the M. A. M. to see whether binding contracts could be made that would make the fixed discount plan feasible. If adopted, such a plan would affect only the jobbers and dealers, the matter of price to the car manufacturers being left open to individual discretion.

Following the meeting of the spark plug makers, the manufacturers of magnetos and coils held a conference on Tuesday afternoon, at the Cadillac. In attendance at this meeting were representatives of the Connecticut Telephone & Electric, Splitdorf, Autocoil, Hess-Bright, Remy and Pittsfield interests, with W. P. Wood, of the Pittsfield company, presiding. The third conference is scheduled for this afternoon (Thursday), at the Hotel Astor, when the manufacturers of timers and distributers will get together for a review of phases of the trade directly affecting their business. The conferences are in line with the M. A. M. policy of having the different classes of manufactures, constituting the membership, work in groups, on the committee plan. The conclusions of each of the meetings will be reported fully to the manufacturers in each group who were not able to attend, so that they will have an opportunity to express themselves before radical action is taken.

Hall and Wetzel in New Lamp Company.

Charles M. Hall and Thomas J. Wetzel, together with a number of prominent business men of Detroit, Mich., have organized the C. M. Hall Lamp Co., to manufacture automobile lamps of the high grade types. The concern is a Michigan corporation capitalized at $150,000, and will have its plant in Detroit. At a meeting held last Saturday, 20th inst., $100,000 of the capital was paid in, and the following officers were elected: John W. Leggitt, president; Thomas J. Wetzel, vice-president; J. F. Harty, treasurer; Charles M. Hall, secretary and general manager. As a pioneer lamp representative Hall is known throughout the trade, while Wetzel enjoys the widest possible acquaintance with the car manufacturers and the jobbers, as the selling agent for several prominent makes of parts and accessories. A complete line of the new company's lamps will be shown in the near future.

Receiver Asked for Gilmore.

Receivership proceedings have been brought against William R. Gilmore, of Philadelphia, Pa., who has been endeavoring to conduct a jobbing business in automobile accessories and supplies. He had an establishment on Broad street, but was in the "semi-jobber" classification.

WARNER SUES ON MAGNETIC TYPE

Stewart & Clark Made Defendants in Speedometer Infringement Action—"Multipolar" Model the Cause.

Having decided that there is not as much difference between "multipolar" and "magnetic" as the words might indicate, the Warner Instrument Co., of Beloit, Wis., has brought suit against the Stewart & Clark Mfg. Co., of Chicago, Ill., on the ground that the latter company is infringing the Warner patent rights as to the magnetic type of speed indicator for automobiles. The bill of complaint has been filed with the United States Circuit Court at Chicago, and specifically alleges infringement of the Warner company's patent No. 745,468, which was granted December 1, 1903, and which is claimed to cover the application of the magnetic drag principle to speeding indicating devices.

Heretofore the Stewart & Clark Mfg. Co. has employed the centrifugal principle entirely in the construction of its well known Stewart speedometers, but among many new models which the company produced for the 1909 season was a model denominated as being of the "multipolar" type. The polarity implied by the description proved to be magnetic polarity, the appearance of the model disclosing that magnets are utilized for the actuation of the indicating part of the mechanism.

Inasmuch as the principle involved has been a distinguishing feature of the Warner Auto-Meter from the first and because of the broadness of the Warner patent claims covering indicators using magnetic means for moving the responsive element, the suggestion of infringement was such as to impell the plaintiffs to have a final legal determination on the question. To this end the matter was placed in the courts, where the intricacies of speedometer construction will have an adjudication calculated to clarify the patent situation.

CAN COLLECT DUTY OVER AGAIN

Foreign Cars Must Pay Each Time Imported, Though Bought Here—Automobile Ruling Affects Horses.

Payment of the import duty on a foreign car does not necessarily relieve it from being assessed over again on its second entry into the United States, according to a decision of the board of general assessors, in New York City, particularly if between its first and second importations it has been used and repaired abroad. Objection was made by Mrs. Charles T. Barney, widow of the late head of the Knickerbocker Trust Co., to paying the 45 per cent. which the collector of the port of New York insisted on levying on her machine when it was shipped back from Europe. Inasmuch as she had bought the car in the United States and the import duty had once been paid on it, she contended through her representative that the exaction of the duty for the second time was unjust and illegal. The board of general appraisers, however, sustained the collector, and cited a recent decision of the United States courts that an automobile of foreign manufacture, if used and repaired abroad after purchase in the United States, must pay duty on its return, even thought it has been assessed the Dingley tariff rate at the time of its original importation. Apparently it should have been arranged to get a "drawback" or return of the original duty when it was shipped abroad, in order to protect the owner.

Another decision by the board, as showing that automobiles are not the subject of special prejudice, resulted in a ruling that a horse is no more entitled to the "household effects" classification for free entry than is the motor car. In fact, the board's ruling was chiefly based on the recent decision of the United States Circuit Court of Appeals denying such exemption to cars.

Hawley Develops a Demountable Rim.

The Hawley Demountable Rim Co. has been organized in Minneapolis, Minn., by R. C. Hawley, formerly manager of the Hawley Auto Co. The concern plans to produce a rim of which Hawley is the inventor. Its general features are the placing of two lugs 120 degrees apart on the inner circumference and a worm binding at a third point, the latter being the only one at which the wrench or tool need be applied.

Death of Henry Timken.

Henry Timken, president of the Timken Roller Bearing Axle Co., of Canton, O., died in San Diego, Cal., on the 16th inst., at the age of 76 years. His illness lasted but a few days and its fatal termination was a surprise in spite of his age, since he was unusually sturdy and rugged. He was buried in San Diego on Sunday, 21st inst. Beginning his career in St. Louis when that city had but 25,000 people, Mr. Timken for 45 years was a conspicuous figure in the manufacture of roller bearing axles, but while retaining the presidency of the Timken company, retired from active business about 12 years ago and took up his residence in California. His first patent, which he manufactured and put upon the market, was the Timken spring. This was followed by his invention of the tapered roller bearing that bears his name.

Birmingham Has Factory Prospects.

Automobile manufacture in the South is the subject of considerable promoting effort, and Birmingham, Ala., is pluming itself over the fact that it has prospect of becoming a motor car producing city. A company capitalized at $250,000 is announced as about to establish a factory on Avenue B, to make a car which will be known as the "Great Southern Six" and which is not only to agree with its name in the number of cylinders, but is to be marketed at a very "reasonable" price. E. F. Enslen, of Birmingham, who is slated for the position of secretary-treasurer, declares that the plans of the company have been completed and that it will be under way in two or three weeks.

Paige and Wilcox Now "Triplets."

Fred O. Paige and H. A. Wilcox, formerly of the Reliance Motor Car Co., of Owosso, Mich., have organized their new company to a point where they are ready to receive propositions from communities that would like to have the plant. The concern will be known as the Triple Motor Truck Co., and Ann Arbor, Mich., has been given the first chance to subscribe for $225,000 worth of the stock.

Briscoe Brings Southern News.

Benjamin Briscoe, president and general manager of the Maxwell-Briscoe Motor Co., of Tarrytown, N. Y., has returned from a southern trip and reports business conditions, particularly in the automobile field, as having undergone a great improvement. The territory having its center in Atlanta, especially, is giving promise of a lively season.

Pelletier Relinquishes Studebaker.

E. LeRoy Pelletier will hereafter devote himself exclusively to the duties of advertising manager for the E-M-F. Co., of Detroit, Mich., and has given up the responsibilities of the Studebaker advertising which he not long ago assumed in addition. As a health recuperative measure he is taking a brief vacation.

Thayer-Isham Makes a Truck.

The Thayer-Isham Automobile Co., 1713 Dunlap avenue, Marinette, Wis., has completed its first motor vehicle. It is a 20 horsepower truck, with planetary transmission and high wheels.

DEALERS DEMAND COMMISSIONS

Sue Makers on Direct Sales in Their Territories—Assert Agency Rights—Defense Offered by Manufacturer.

Disagreements between manufacturers and dealers as to commissions on cars placed in the latters' territories, respectively, have led to no little litigation at different times, and two more law suits arising from disputes of this kind have just been added to the list. Claiming commissions due on two cars sold in its territory during 1906-8, the Palace Auto Co., of Kansas City, Mo., has filed an attachment suit against the Olds Motor Works, of Lansing, Mich., while in Norristown, Pa., suit has been brought against the Autocar Co., of Ardmore, Pa., by Henry R. Hoopes, a local dealer, on the ground that the defendant company sold cars in his territory in breach of the contract under which he had the agency.

In the suit against the Olds Motor Works, the plaintiff Palace Auto Co. alleges that because of the agency agreement which it had with the defendant company at the time, commissions to the amount of $1,080 are due it on the machines which the Olds company placed direct with customers in the territory, and $3,600 is also asked on other counts for money said to be owing to the Palace company.

The defendant in the Hoopes suit against the Autocar Co., in fighting the case contends that it kept its part of the contract until the plaintiff wilfully and deliberately made the breach. It is alleged that he did not lay in an adequate stock of cars, did not advertise the cars, and made no attempt to sell the cars, and that he sold other cars and made the statement that he was going to get all the contracts he could with different companies, push the best selling car and by means of his contracts keep out competition. Asserting further that he did not take the cars his contract called for, the defendant claims that while he was bound not to sell "unlicensed" cars, Hoopes gave money aid to others to sell them.

Fernand Renault Dies in Paris.

Fernand Renault, of Renault Freres, the well known French automobile manufacturers, died in Paris on the 22d inst. He was 46 years old, and his death was due to acute nephritis, he having suffered for some time from digestive and kidney trouble. With his two brothers, Louis and Marcel, he inherited a large cloth manufacturing business from his father, which provided sufficient money for the sons to experiment with motor cars early in the industry. In 1897 they began producing cars embodying original features of construction devised by Louis. The latter survives, but Marcel was killed in the Paris-Madrid race in 1904.

RAINIER SOLD HIS HOLDINGS

Disposed of His Interests to Durant Before Forming New Company—Plant in Generalmotors Fold.

Back of the circumstances leading to the organization of the new Rainier Motor Co., there appears evidence of the delicate handiwork of the Flint (Mich.) manufacturer, who in floating a $12,500,000 holding company must needs have something for it to hold and who, it would seem, had cast a calculating eye on the Rainier plant as a possible acquirement some time ago. Although the purchase of the factory at Saginaw last week by a new concern, known as the Marquette Motor Co., and headed by W. C. Durant, of Generalmotors fame, was in the nature of a surprise to the trade, it is stated that before the closing of the transaction and before the forming of the new Rainier company, Rainier had disposed of all his holdings in the old company to Durant. The latter was thus facilitated in acquiring control of the property, in which he was also assisted by the bondholders in Saginaw.

As a result of the arrangement, the new Rainier company will pursue the lines on which the old company was originally conducted, and the Marquette Motor Co. will undertake the task of producing cars to its specifications and orders. So great are the expectations of business by the Rainier interests that it is thought that the factory's output for some time will be accounted for almost exclusively through this channel. Furthermore, Rainier indicates that his company also has plans for getting into the taximeter cab business in a large way before long.

Formal organization of the Marquette Motor Co. took place late last week, and resulted in the election of W. C. Durant, president; A. T. Ferrell, vice-president; and Arnold H. Goss, secretary and treasurer, these officers also constituting the board of directors. Of the capital stock of $300,000, the larger part, $175,000, has been subscribed by stockholders associated with the Generalmotors proposition; while $125,000 is taken by Saginaw people who were previously in the Rainier investment, in most cases as bondholders. Durant and Goss, general manager and secretary, respectively, of the Buick Motor Co., provide what may be regarded as ample representation for the Generalmotors interests in the officering of the concern as against the minority stockholders represented by Ferrell, of Saginaw, who was one of the chief bondholders. The $100,000 in bonds of the old Rainier company held by Ferrell on mortgage will at once be discharged, and capacity production is predicted for the immediate future. Such surplus of product as the plant may have over its arrangement with the new Rainier company, will be marketed, it is said, through the organization of Generalmotors agencies.

Plan to Make a Starting Device.

Organized with a capital of $50,000, a concern to be known as Long & Burress has undertaken to manufacture an automobile starter in Indianapolis, Ind. The device is the invention of George Burress, who after enhausting his finances in developing it, enlisted Dr. R. W. Long in the enterprise as senior partner. In principle the starter is a foot pedal communicating mechanically with the motor shaft in a ratchet combination having great leverage, so that a series of pushes on the pedal will turn the crankshaft.

Motor Fire Engines the Product.

After a long series of negotiations, S. W. Luetweiller has organized a company to manufacture automobile fire engines in Rochester, N. Y. Associated with him are Samuel B. Williams, formerly city treasurer in Rochester, and W. C. Smith. The company is reported to have purchased the plant of the American Laundry Machine Co. in Ames street, to which Leutweiller's present manufacturing equipment in Los Angeles, Cal., will be moved.

Mundy Examined by Referee.

The examination of Harry Mundy, of Utica, N. Y., who was forced into bankruptcy by his creditors, took place last week before Referee in Bankruptcy De LaFleur. It developed that his liabilities were $11,652.41 and that his assets comprise three pieces of real estate in which his equity amounts to about $5,000. The schedule, as filed, was found to be correct.

Becker Exchanges Jobs with Becker.

J. H. Becker and B. A. Becker have exchanged positions in the management of the Elmore Mfg. Co., of Clyde, O. B. A. Becker becomes secretary and general manager and J. H. Becker officially takes up the duties of treasurer. The transposition is simply a change of work more congenial to each, respectively, and involves no alterations in policy.

Plow Leaves Hartford Rubber.

Henry Plow, who for 13 years has served the Hartford Rubber Works Co. as assistant treasurer and treasurer, has resigned that office to accept the office of assistant treasurer of the Mitchell Motor Car Co. He will make the change on the first of the coming month.

Building Bodies on Pacific Coast.

The Beason Lumber Co., of Los Angeles, which recently was incorporated with capital stock of $250,000, has commenced the manufacture of automobile bodies and bentwood work generally. An output of 50 bodies per week is in prospect.

GOODYEAR VICTORY WAS FINAL

Supreme Court Refuses to Review Consolidated's Infringement Case—Relates to Solid Rubber Tires.

Conflicting patent interests in the tire and automobile industry have given trade importance to the comparatively recent attitude of the United States courts to the effect that where infringement proceedings have been met and defeated in one jurisdiction, they cannot be renewed against the same defendant in another district or circuit, a principle which has again been asserted this month in the winding up of a long legal battle over solid tire patents between the Consolidated Rubber Tire Co. and the Goodyear Tire & Rubber Co., both of Akron, O. The termination of the litigation, so far as the Goodyear company is involved as a defendant, came about through a decision of the United States Supreme Court denying the certiorari petition of the Consolidated company asking for a review of the Goodyear case, which had been decided in the latter's favor in the United States Circuit Court of Appeals.

In the spring of 1899 the Consolidated company began suit against the Goodyear company for infringement of the Grant patent on solid rubber tires, the action being filed in the United States Circuit Court at Cleveland, O. A decision adverse to the Goodyear company was rendered by Judge Wing, in October, 1901. The defendant carried the case up to the United States Circuit Court of Appeals, furnishing a $100,000 bond. On May 7, 1902, the court, consisting of Judges Day, Lurton and Severance, reversed the lower court and found in favor of the Goodyear Tire & Rubber Co. The plaintiff made application for a hearing to the Supreme Court of the United States, but the petition was denied.

Having gained a favorable decision against another rubber tire manufacturer about two years later, this time in the New York district, the Consolidated company again endeavored to have the Goodyear case reviewed by the Supreme Court, because of the conflicting decisions in courts of equal jurisdiction. On March 8, the Supreme Court for the second time refused to review the case, indicating that so far as the Goodyear company was concerned the action had its conclusion in the decision of the Court of Appeals. While in no way affecting the prosecution of infringement cases against other rubber companies than the Goodyear, the latter states that the Supreme Court's decision has the result of insuring it and its customers from further possibility of infringement suit under the Grant patent. Furthermore, the decision is of wide effect in confirming the policy of the Federal courts in protecting a defendant from repeated attacks.

In the Retail World.

Charles Custer has begun business in Sullivan, Ill., with a salesroom and garage. He will handle the Ford.

The Minneapolis Auto Tire Repair Station has opened at 1416 Hennepin avenue. Minneapolis, Minn. S. A. Nolan, from Akron, O., is in charge.

The Miami Automobile Co. is a new organization in Piqua, O. Its chief proprietor is Simon Amman, and it will have a "generalmotors" agency.

The Hartman Motor Car Co. will shortly start business in Omaha, Neb. F. G. Hartman is general manager and the company will handle the Marion.

The H. L. Keats Co., of Portland, Ore., has been appointed a distributor for Lozier cars. The company will have the entire State as its territory.

Simrell and Schnell, of the Court House Square Garage, in Scranton, Pa., have taken a new garage and salesroom. The location chosen is at 517 Linden street.

Chapman & McKenzie have opened a well equipped automobile repair shop in Providence, R. I. It is located at 773 Broad street, corner of Potter avenue.

The Burns Automobile Co., of Brooklyn, N. Y., has opened its new salesrooms at 1295 Bedford avenue. The old location at 31 Grant square will be retained as a garage.

L. C. Dennison has undertaken Winton representation in Cincinnati, O. He has leased the quarters lately occupied by the Second National Bank at 216 East Ninth street.

The Midland Motor Car Co., of Kansas City, Mo., has moved from its temporary quarters at 318 East Eleventh street to a new home. The latter is at 1606 Grand avenue.

The Jackson Motor Car Co., of Kansas City, Mo., managed by J. C. Powlesson and W. E. Mallory, has a new salesroom at 1714 Grand avenue. It provides more room than formerly.

W. P. Book, of Los Angeles, Cal., has taken the agency for Alco cars. He is building a salesroom and garage on South Olive street, which will be devoted exclusively to these cars.

A. J. Gorman, formerly of Kaiser & Gorman, St. Louis, Mo., agents for Dayton tires, has severed his connection with the firm. He is now the local agent for Standard speedometers.

G. W. Sewell and O. Johnson have formed the Iowa Auto Co., which will conduct a sales, garage and repair business in Clinton, Iowa. The concern has taken a building at 116 Sixth avenue.

The Post Motor Co., of New York City, handling the Hart-Kraft delivery wagons, has changed its location. It has moved from its former quarters at 1623 Broadway to 229 West Fifty-fourth street.

The Locomobile branch in Chicago, Ill., is to vacate its present location and move further south on Michigan avenue. A new building is being put up for its occupancy at the corner of Twentieth street.

W. H. Thompson has established an automobile repair shop at Fifteenth and H streets, northeast, Washington, D. C. Being in the suburbs, it is the first to be encountered on the road from Baltimore.

To handle Velie cars in Kansas City, Mo., a new concern has been formed, called the Evans Automobile Co. The organizer is George Evans of the Evans-Smith Drug Co., and the headquarters will be at 1927-9 Grand avenue.

The first automobile garage in Chelsea, Mich., has been opened by Mark Lowry. It is in the basement of the old Glazier building which was originally built for an automobile factory and is well adapted to garage purposes.

Charles M. Lee, of Newark, has been made manager of the branch of the Essex Automobile Co., which has been established in Montclair, N. J. He will handle the Jackson and Ford and will also institute a taximeter cab service.

A receiver has belen appointed for the Atlantic Automobile Company and Machine Works, of Atlantic City, N. J. George W. Meredith is the appointee and he will conduct the business as heretofore pending foreclosure proceedings.

In Indianapolis, Ind., a new salesroom for Marmon cars has been opened, to be known as Local Branch, Nordyke & Marmon Co. It occupies the ground floor corner of the Central Union Telephone building and will be in charge of C. E. Gambill.

W. D. Woolwine, formerly a banker, has entered the automobile business in Los Angeles, Cal. He has become treasurer of the Woolwine Motor Car Co., which has taken the local agency for Rapid trucks. Woods R. Woolwine is president of the corporation.

Tom Botterill, of Salt Lake City, Utah, has moved into a large new garage on State street, between South Temple and First South. The new building, which is of cement, has two stories and a basement and is equipped with elevator and the most modern garage and repair devices.

The Terre Haute, Indianapolis & Eastern Traction Co. is erecting a garage and electric charging station in Terre Haute, Ind., on North Ninth street, between Wabash avenue and Cherry street. While primarily for the local officials of the company, public business will also be solicited.

The Studebaker Bros, of Indianapolis, is to be the name of the firm which will handle the Studebaker lines in the Indiana metropolis. Frank Staley has been appointed manager, and pending the completion of the concern's new building on North Pennsylvania street, temporary quarters have been taken at 400 North Capitol avenue.

The Week's Incorporations.

Atlanta, Ga.—National Taxicab Co., under Georgia laws, with $15,000 to $250,000 capital. Corporators—H. L. Hopkins and J. H. Johnson.

Enid, Okla.—Enid Automobile Co., The, under Oklahoma laws, with $10,000 capital. Corporators—R. W. Couter, Michael Goodnature and C. V. Cessna.

Grand Forks, N. D.—Sims Automobile Co., under North Dakota laws, with $10,000 capital. Corporators—C. D. Lord and F. C. Lord, of Park River, N. D., et al.

Algona, Ia.—Algona Automobile and Machinery Co., The, under Iowa laws, with $10,000 capital. Corporators—F. E. McCorkle, L. J. Dickinson and H. B. Gardner.

Taunton, Mass.—Taunton Taxicab Co., under Massachusetts laws, with $2,000 capital; transportation. Corporators—William E. Rose, Harry Carlow and Frank B. Mason.

Dover, Del—Automobile Repair and Sales Co., The, under Delaware laws, with $5,000 capital. Corporators—E. J. Forham, H. M. Browne and J. J. Harper, all of New York City.

Columbus, O.—Columbus Auto Brass Co., The, under Ohio laws, with $10,000 capital. Corporators—C. S. Means, Roy Coffman, D. B. Neil, C. E. Roth, G. E. Smith and F. C. Eaton.

Milwaukee, Wis.—Wisconsin Motor Mfg. Co., under Wisconsin laws, with $50,000 capital. Corporators—Charles H. John, Edward Schwartzburg and Fred C. Kuetemeyer.

Camden, N. J.—P. G. H. Auto Delivery Co., Inc., under New Jersey laws, with $125,000 capital; automobile delivery business. Corporators—W. A. Pittis, A. Wood and V. A. Murray.

Chicago, Ill.—American Auto Appliance Co., under Illinois laws, with $200,000 capital; to manufacture automobile appliances. Corporators—E. A. Garvey, C. A. Garvey and F. R. Belt.

Chicago, Ill.—Centaur Motor Company of Illinois, under Illinois laws, with $10,000 capital; to deal in motor vehicles, etc. Corporators—A. M. Robbins, Robert E. Haley and Albert E. Lake.

Chicago, Ill.—Allen Fielder Co., under Illinois laws, with $5,000 capital; to sell cars and accessories and conduct garage. Corporators—Charles R. Browne, Charles Martin and H. M. Ryall.

San Antonio, Tex.—Seeing San Antonio Co., under Texas laws, with $6,000 capital; to operate sight-seeing motor vehicles. Corporators—P. B. Schmeelk, W. S. Beavers and J. N. Muncester.

Kittery, Me.—Panther Car Co., under Maine laws, with $100,000 capital; to manufacture and sell motors, cars, etc. Corporators—H. Mitchell, of Kittery, president; S. J. Morrison, of Portsmouth, N. H., treasurer.

GERMANY EXPERIENCES A SETBACK

Law and Labor Difficulties Make the Motor Situation Unsatisfactory—Some Other Causes of Stagnation.

In contrast to some of the other automobile producing countries of Europe, the appearance of activity and prosperity in motor car production which earlier in the year was presented by Germany was the occasion of no little remark by American observers who were abroad at the time of the Paris Salon, but the Fatherland has since relapsed into a much less flourishing condition, according to a Berlin correspondent of the Motor World who has made a canvass of the situation. Commercial vehicles and cheaper fuel present two live problems with which the German trade is wrestling, and the manufacturers of cars are having both law and labor difficulties.

"Special reasons are responsible for the unsatisfactory motor situation," he declares. "The high government tax which went into effect at the beginning of the year and the proposed liability law (Haftpflichtgesetz) which is now seriously discussed in the parliament, have produced something like a standstill in the market by greatly lessening the number of people wishing to purchase cars. The liability law would render an automobile owner responsible for any damage done to other people by his machine irrespective of whether he was riding in the car or not. The money market was extraordinarily bad the past year, and the effect of the custom tariff was to favor the import and hinder the export of automobiles. On the whole the economic situation in Germany, from the motor car standpoint, has been and still is anything but pleasant.

"At the beginning of 1908," he explains, in reviewing the condition of the German industry, "there were many orders, and during the spring and the first summer months the works were quite busy. But the getting of orders for the rest of the year was never before so difficult. Furthermore, there was continuous bad weather in summer and the large crowds usually flocking to the numerous beer gardens remained at home. Consequently the breweries had occasion to carry but little beer to such resorts, this transportation being done chiefly by motor cars. Still more were the omnibus companies affected, particularly those maintaining motor lines to thousands of pretty suburbs and villages such as prevail in South Germany. A number of local concerns went out of business for want of passengers.

"This, of course, did not favor the development of the local traffic by means of motor vehicles, to which latter so much attention is given by the manufacturers in the German empire. The fares were generally so low that not much profit is left, and it is the intention to raise them soon.

"Experiments have been made to cheapen the fuel," he continues, "and with some success. Considerable benzole is being used now as it is much cheaper and is thought to give the same power. It has the further virtue, from the German view, that it can be produced at home.

"The most numerous and longest motor bus lines are at present in Bavaria," it is stated, "where the results as concerns safe service and satisfactory profit are quite satisfactory. The government representatives of that kingdom granted 2,500,000 marks to further the overland traffic by motor cars, especially to supplement the local railways. Other parts of Germany are making serious efforts to follow this example.

"The number of automobiles used in the mail service is increasing, and in this respect Bavaria is again leading. Munich and Nuremberg are the cities presenting the best examples. Considerable use is made in all of Germany of motor cars for fire departments, municipalities and the army—for the latter perhaps to a larger extent than in any other country.

"As regards export, the crisis in London affecting the omnibus companies, through the new tariff and the London police regulations, had an unfavorable effect upon the many German firms building heavy cars and buses for the British metropolis. In former years this special line has been a lucrative business, but in 1908 the profits had already been much reduced for want of orders. On the other hand the export for South America has become very extensive. However, the large number of cars made for foreign countries has had a reducing effect upon the price.

"Continuous dissatisfaction is prevailing on the part of the workmen in the shops, and the constant desire for higher wages results in frequent strikes. These have not lasted long, however, and now when so many men have been laid off they are satisfied to find employment under the old terms."

Austria is incidentally mentioned as having greatly increased its home production of motor cars during the past year, four large plants having been erected in 1908. These, it is stated, are sufficient to supply domestic demand quantitatively, while the quality of Austrian production has always been high. The Austrian custom tariff has reduced the import of cars from the 90 per cent. of former years to a much lower figure. Certain types of voiturettes are even built for foreign customers.

Big Plans for Phillips's Lawn Mower.

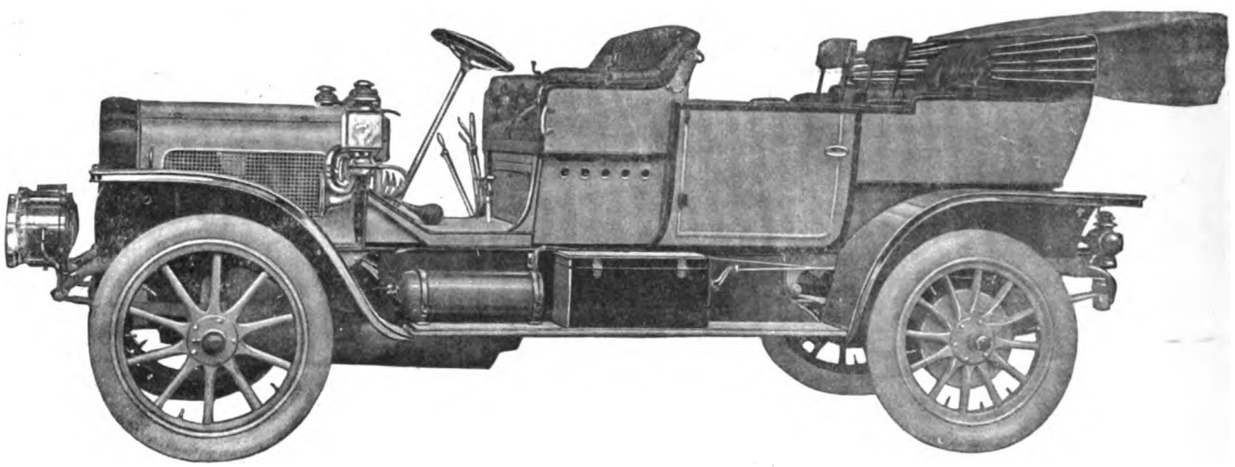
C. H. Phillips, a bicycle dealer of Poughkeepsie, N. Y., has patented what is described as a "combination field and farm motor lawn mower," of which great things are expected; so great indeed that it is stated that a two million dollar company is being formed to manufacture it.

BATES'S BAIT GOES A-BEGGING

Mail Order System Fails to Revolutionize the Tire Trade—Its Promoter Admits Buyers are Reluctant to Bite.

Whatever panics and perturbations the dealers and the old line manufacturers of automobile tires may have had as the result of the discovery by Charles Austin Bates that what the automobile owner has long needed is a tire factory from which he may get his tires direct on the mail order system, were unwarranted after all. The fears and quakes which it aroused can go back to cold storage again, and the established makers may breathe free once more, because Charles Austin has discovered that his previous discovery was a false alarm and that "there is really no place for a direct-from-factory-to-consumer tire."

"I have made up my mind that I was wrong about the selling of '——' tires at a net price, direct to the consumer," he writes to the treasurer and sales manager of the rubber company in Rutherford, N. J., of which he is the august president. "I overestimated the willingness of an automobile owner to save money at the expense of some inconvenience. After five months of experiment, I am satisfied that the owner is willing to pay for the convenience of being able to buy his tires in his own neighborhood from a local dealer, where he may also have the facility of a charge account."



Doubtful as some of the more conservative tire makers have been as to the possibilities of the scheme which Charles Austin pushed for a time with vigor, it is nevertheless interesting to have him so frank in declaring its impracticability. As a one time advertising "expert" and subsequently as a gold mine promoter, he has great confidence in the power of the process letter, when devised with "pulling" copy, to create customers. But apparently the attempt to market even the modest output of his tire factory by this method has not met with the success that he anticipated, although he still holds the door open to retail, mail order trade, and still uses the circular letter to encourage it. However, the tires are no longer to be strictly direct mail order goods and suitable concessions will be made to dealers and others who will help in finding a market for them.

In reviewing the defects of the system in its entirety he is of the opinion that: "Rather than be compelled to send us his money in advance, the owner will willingly pay a dealer's legitimate profit." How general such reluctance is to part with money in advance for goods with which the owner is not familiar, he does not state, but makes it plain that on tires, at any rate, the motoring public is not highly susceptible to the enticements of the direct mail order marketing method.

THE WHITE STEAMER

Is the Most Desirable Car

The White Steamer has many desirable qualities not possessed by any other automobile. It is the only car which is noiseless, odorless, smokeless and free from vibration. It is the only car which can be driven at any speed without the shifting of gears. For these reasons the passengers in a White enjoy a degree of comfort not obtainable in any other type of car.

The superiority of the White in these respects was well summed up in the following official report by the Quartermaster-General of the United States Army:

> "The White is simple in operation. The means of propulsion being steam, it is better suited for the transportation of the sick and wounded than gasolene cars on account of its free and smooth running, freedom from violent vibration and ease of controlling the speed between maximum and minimum without jerks or jolts."

These considerations, which influenced the War Department (and later the Navy Department) to adopt the White exclusively for motor ambulance work, should incline the private purchaser, who values simplicity and comfort, toward the White.

The White has an unequaled record for supreme reliability and for low cost of up-keep, and anyone who purchases a car without at least investigating the White is acting with only a partial understanding of present-day attainments in the construction of automobiles.

We make two models—a 20 horse-power car at $2000 and a 40 horse-power car at $4000 (shown above).

NEW YORK, MARCH 25, 1909.

Protection of Cars in the Garage.

Many garage men who lay stress on the completeness of their facilities for repairing cars overlook the importance of protecting the upholstery and coach work from the havoc wrought by careless workmen who lay their tools on fenders or woodwork and allow their greasy hands and clothes to touch the paint. A Belfast (Ireland) concern which makes a specialty of repairing motor cars has recognized the importance of protecting the finish and upholstery of cars entrusted to its care, and has devised a system of covers which are applied to the finished surfaces of cars brought in for repairs before any work is begun. The covers which are specially made for the purpose are placed on the upholstery, fenders and spring hangers. When wheels are to be removed for the attachment of speedometer driving gears, or repairs to pivots, covers are placed on the tires to protect the wheels from becoming scratched or the finish marred through contact with tools, greasy hands or grimy and gritty wearing apparel.

Such an example might well be adopted by American garages, for no matter how careful the workman may be, or how small the adjustment, it is impossible to avoid coming in contact with the finish which only can be to its detriment. The precaution affords the motoring fraternity a guarantee on the part of the repairman that the car will be returned with the coach work and interior finish in the same condition as when received and that it will not require a visit to the paint shop or upholsterers to be made presentable. Painting and upholstering are considerable items of expense and where garage keepers adopt safeguards which tend to decrease the frequency of such work their foresight is certain to be duly rewarded. Motorists appreciate the adoption of methods which tend to reduce the cost of upkeep of their cars and show their approval of the garage man's efforts in their behalf by becoming permanent customers, and by bringing in additional custom.

Incidentally, those owners who maintain private garages will be repaid for the trouble of having covers made for their cars by the avoidance of scratches or the soiling of the finish when they or their chauffeurs are working around the engine or chassis. A refinished car never can be made to look "as good as new" despite assurances to the contrary.

The Little Joker in the Big Order.

Accessory makers who receive astonishingly big orders for their goods, but conditioned on a very low quantity price, have no reason to congratulate themselves on closing the business until they have waited through the subsequent season and have seen what happens. In all probability they have been made the victims of a piece of business strategy which despite its age is successful in breaking the prices of even the most experienced manufacturers, where the latters' vigilance or far-sightedness is temporarily blinded by the prospect of big business.

This delicate operation of breaking a manufacturer's prices is so frequently performed with such painlessness and the administration of "laughing gas" is so effective, that the patient sometimes does not really know what happened to him. While mourning his subsequent troubles he may even look back upon those who operated on him as his benefactors and never suspect the relation between the operation and its effects.

Apparently it would be very illuminating to a large portion of the accessory manufacturing trade to disclose to them that many of the big quantity orders which are floating around are nothing more nor less than "blinds" or "plants" by which a number of buyers combine on one big stock order and secure prices considerably lower than the maker is willing to grant to them individually. The placing of several enormous recent orders in the accessory field provides instances of this, and already some of the manufacturers concerned are beginning to feel the unpleasant results and to awaken to a realization of what the deals signified in actual fact.

After vain attempts to get an "inside" on a certain line of goods that is greater than that of their competitors, big buyers are not averse to combining in groups of from three to ten or more for a big order to be placed in one lump, if the manufacturer can be persuaded to grant a suitable quantity price. Amazed by the size of the order, the manufacturer may cut down to bed rock to meet the wishes of the one to whom the negotiations have been entrusted. Rarely does he have reason to suspect that when the goods are delivered they will be divided up among his best customers, who when his salesman comes around later, will airily announce that they will not need any more of his goods for some time.

Peculiarly enough, the very manufacturers who are strongest in their respective fields are the most tempting marks for a buying coup of this sort. Their goods being in steady and certain demand, the buyers are safe in plunging to some extent on a big stock order where the possibilities of a price reduction are at all attractive. Having fixed ideas of business policy which he maintains with corresponding vigor, the maker may long resist the attempts of the jobbers and dealers to beat him down on his prices, only to "fall for" the immense quantity order from a more or less mysterious purchaser who must have an "inside."

Struggling makers with unproved products do not encounter any of these beneficent pieces of good fortune, in meeting buyers who want to place orders for 50,000 or 100,000 at a time. No such luck. It is the maker whose goods are sure of steady sale

Digitized by Google

who is approached with the quantity price proposition.

Not but what the jobbers or the car manufacturers or the dealers take a perfectly legitimate means of getting the best price they can. Even if the negotiator for the purchase keeps his own counsel as to where the goods are going to be used, or hints about export markets and vague new outlets, he is quite within his ethical rights to demand a reduced price for so large a quantity as he is prepared to order. Whatever harm comes to the accessory maker through supplying such buyers may be laid either to his inexperience or to his own lack of watchfulness and intelligent investigation.

Occasionally there may be reasons why a manufacturer should accept an order of this character, despite the fact that his eyes are open. He may be willing to make the price sacrifice to place a positive quantity order on his books for the ensuing season or to raise ready money. He may foresee a change in market conditions which his customers do not sense. Where he knows that the buyer is not ordering for himself alone, but for others as well, he can calculate and weigh all the phases of the effect that such a transaction will have on the future of his business.

Quite different, however, is the case of the accessory maker who having fought out the question of price with his trade and enjoying a steady business, is tempted to take the bait of some shrewd trader in the form of a staggering big order at a low price. An examination of the buyer's ability to sell such a quantity, thoroughly conducted, ought to yield an index of the degree of danger involved in supplying him. Before yielding to the quantity terms, the maker must remember also that whatever concessions he makes are almost certain to become known to his customers, giving them ground ever after for demanding price reduction. But what is most important of all, he should consider the probability that the goods sold at the low price will go into the territory from which he has heretofore been receiving a steady flow of orders at the old price. Such a result means that the territory will go dry of orders almost instantly and that never again can the old prices be fully restored.

In resisting the temptations put in his way and designed for his downfall, the accessory manufacturer may take courage from the fact that jobbers and dealers at heart have a secret affection and respect for goods on which the prices are absolutely fixed and uniform. The goods on which nobody is certain of getting the bottom are what cause the worry. Trade experience and development forces the conclusion that what the accessory maker needs, next in order to a good product, is a comprehensive selling plan and a stiff backbone—so stiff, in fact, that even the advisers in his own employ cannot make him bend obeisance to quantity orders.

Occasional comment is heard of the effect of the general appearance and finish in influencing the choice of ladies when purchasing a car. Appropos of which, instance the remark of one fair visitor overheard at the recent Boston show. "I don't think I like that car as well as that other one," quoth she, "I think mahogany makes a much better finish for a car than Circassian walnut anyway." The particular portion of the machine referred to was a couple of walnut strips running across the tops of the tonneau doors and representing perhaps 3 feet of rough stock, board measure. Manufacturers please note the advisability of providing a certain elasticity in such minor specifications as these, as perhaps more often than they wot the deciding factor is a matter of a half dollar's worth of inconspicuous and non-essential material upon which they have hardly deemed it necessary to devote more than a couple of minutes thought.

The New York Senate devoted two hours of Tuesday last to a discussion of "joy riding" and finally passed a bill making it a penal offense to use a motor vehicle without the owner's specific consent. It is desirable legislation, but it greatly is to be feared that it will not touch the most notorious of all "joy riders"—the city officials who appear to believe that the municipal automobiles, bought and maintained at the expense of the tax payers, are designed chiefly or largely for their personal pleasure and the pleasure of their families and friends.

A peewee publication, which for more than one reason makes a specialty of distributing manufacturers' catalogs, last week illustrated two remarkable performances. In one Jim Jeffries, the prize fighter, is "being paced by an automobile," which apparently is standing at the roadside or at any rate Jeffries is running away from it. In the other, a heavily loaded automobile is "climbing" a tremendously steep grade—so steep (!) that the houses and telegraph poles actually are falling down hill!

Two weeks since we referred to Automobile Topics as being more respectable than at least one other publication. Judged by more recent occurrences, however, it seems evident that we were mistaken.

COMING EVENTS

March 22-27, Toledo, O.—Toledo Automobile Dealers Association's automobile show.

March 23-26, Daytona, Fla.—The Motor Contest Association's (Inc.) seventh annual international races, Daytona Beach.

March 24-27, Syracuse, N. Y.—Syracuse Automobile Dealers Association's first annual show, New York State armory.

March 25, 26, 27, Logansport, Ind.—Automobile show, old rink.

March 27, Atlanta, Ga.—Fulton County Automobile Club's third annual hill-climb, Stewart's hill.

March 27-April 3, Pittsburg, Pa.—Automobile Dealers Association's show, Duquesne Garden.

April 1-3, Logansport, Ind.—Logansport Automobile and Motorcycle Dealers Association's show, Broadway garage.

April 10, New York City—New York Automobile Trade Association's second semi annual hill climb on Fort George hill.

April 10-17, Brooklyn, N. Y.—Automobile show, Claremont rink.

April 15-17, Louisville, Ky.—Louisville Automobile Association's show, Coliseum.

April 19-24, Bangor, Me.—Eastern Maine automobile and motor boat show.

April 22, Chattanooga, Tenn.—Three days race meet and hill climb on Lookout Mountain.

April 26-May 1, New York City—New York Automobile Trade Association's second annual automobile carnival.

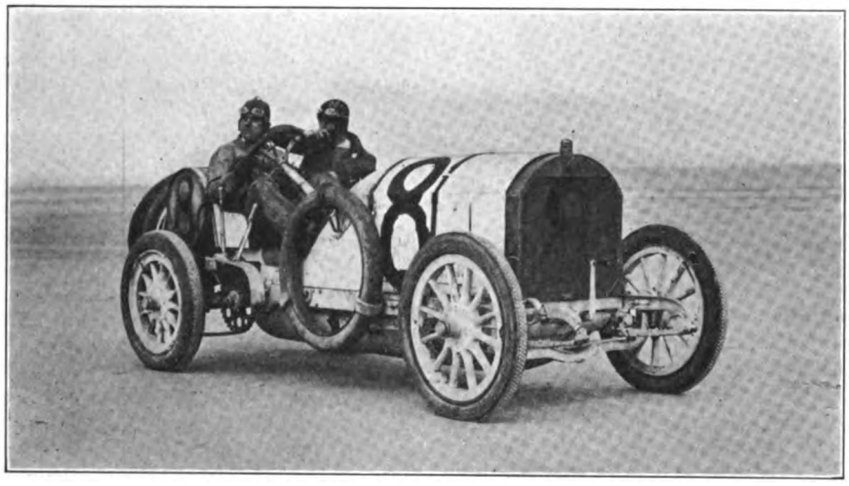
May 3-6, Harrisburg, Pa.—Motor Club of Harrisburg's reliability contest.

May 10-13, Detroit, Mich.—Detroit Automobile Dealers Association's annual four days reliability run.

May 18, 19, Norristown, Pa.—Norristown Automobile Club's endurance run, to Hagerstown, Md., and return.

May 19-22, Philadelphia, Pa.—Quaker City Motor Club's endurance contest, Philadelphia-Pittsburg and return.

May 22, Hartford, Conn.—Automobile Club of Hartford's 200 miles endurance run.



May 30, Wilkes-Barre, Pa.—Wilkes-Barre Automobile Club's fourth annual hill climb on Giant's Despair.

BROWN CAPTURES DEWAR TROPHY

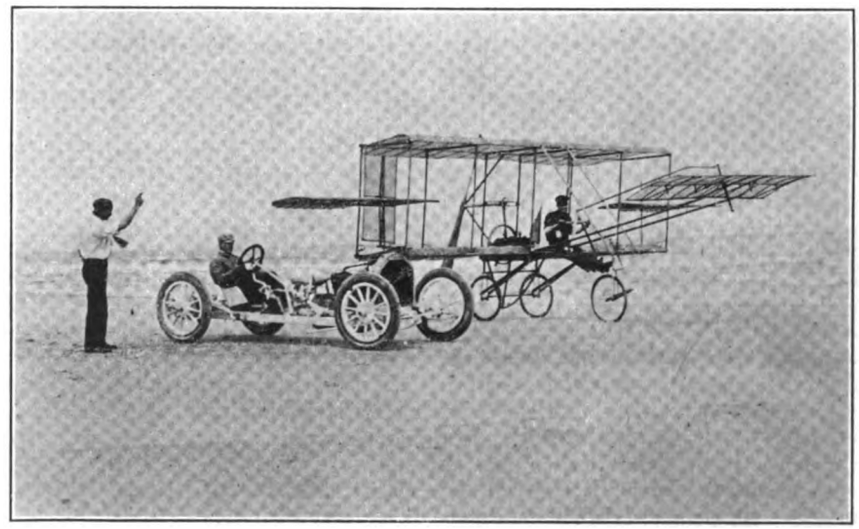
World's Record for Robertson—Bicycle and Motorcycle Contests the Exciting Features at Daytona Beach.

Daytona, Fla., March 23.—Exclusive Ormond, which originally was the "whole thing," again this year "passed up" the speed carnival and its next door, and not so exclusive, neighbor, Daytona, took over the function and received all the advertising and trade. And Daytona has drawn the crowd. The hotels are all filled, though apparently mostly with winter visitors who are staying over for the races, which is the real purpose of the carnival. The array of cars is not as promising as it had been hoped it might be, and the promised aeroplane exploits may not prove as thrilling as the public had been led to believe they would.

DAVID BRUCE BROWN, BENZ, WINNER DEWAR TROPHY

As a matter of fact, one flying machine did appear yesterday, long enough to go through the motions of a make-believe race with an automobile, but indications do not point to anything startling in this line.

Of the old-time throng of well-known automobilists, there is only a vague and scattered reminder. Most of those who are on the Beach, in fact, appear to be those who have come down on business connected with the races. Among these are S. A. Miles, who is acting as referee; Wilber F. Hobbs, of the Michelin Tire Co.; A. N. Mayo, Fisk Rubber Co.; J. M. Uppercue, Cadillac Motor Car Co.; Leonard D. Fisk, Hartford, Conn., agent for the Locomobile, who has a home here; W. B. Wise, General Motors Co.



W. H. Pickens, well remembered about New York, and now racing manager for the generalmotors camp, also is here and appears prosperous. He is conspicuous in a pale green suit and a jaunty brown felt hat. Chevrolet, who is mentioned as designer of the Generalmotors racing stud, by the way, has not appeared. But drivers who will figure with these machines and who are on the beach already are Lewis Strang, George De Witt, Robert Burman and F. B. Myers. Herbert Lytle, lately recovered from a prolonged siege of typhoid fever, will handle a Cadillac car.

What was, by the testimony of Deputy Sheriff John Myers and other local luminaries, agreed to be the biggest crowd ever present on an opening day, witnessed the four events which were cleared off the program this afternoon. The grandstands were filled and for a mile in either direction crowds lined the course. Policed by 30 deputies, the beach was kept clear at first, but during the motorcycle trials which concluded the afternoon, the course was overrun and the danger to contestants and spectators correspondingly multiplied. That all-important factor in beach trials, the wind, was neutral, beginning east and shifting over to southeast later on.

By all odds, the most interesting feature of the afternoon was the bicycle race, while the motorcycle event is deserving of passing mention, particularly on account of the general claim that the mile speed record was broken by Wray, who rode a 15 horsepower "freak." As a matter of fact, Wray's machine was away over 61 cubic inches, the maximum displacement allowed under the rules of the Federation of American Motorcyclists; and nothing he ever may do on the freak will stand as a record.

Because the timing apparatus was short-circuited or otherwise disjointed, the 200 miles stock car race was run following the quarter mile dash for bicycles. Burman, Strang and De Witt, all driving Generalmotors and Herbert Lytle in the Cadillac, started for the turning point, ten miles south of the finish line. At the end of the first round trip down the beach, Burman was leading Strang by 50 yards. As the second car rounded the turn, a roll of tire tape slipped from the machine somewhere and went rolling away down the beach, creating some little excitement for the moment especially in the vicinity of the excited Pickens, who, conceiving that it was an intermediate pinion from the transmission, somehow gone astray, at once became very much agitated. Meanwhile, the time for the 20 miles was being noted as 18 minutes 17 seconds. The Cadillac, which followed, slowed at the turn, Lytle being under the impression that his steering gear was loose, but went on. De Witt, however, mistook the turn and continued past the point where he should have doubled, and only checked his speed when the howls of the crowd admonished him that he was far out of his course.

At 40 miles Strang had the lead, his time being 36 minutes 56⅘ seconds; with De Witt second, in 44 minutes 41 seconds. The Cadillac was away behind the others, while Burman had quit, carburetter trouble serving as the explanation. Strang again had the lead at 60 miles, with 55 minutes 2 seconds. De Witt, remaining in second, had clinched his advantage in the meantime by gaining a lap on the Cadillac. Thereafter,

START OF "RACE" BETWEEN AEROPLANE AND GENERALMOTORS CAR

Digitized by Google

the green caps with white polka dots and flying streamers which were the Generalmotors insignia sailed onward without let or hindrance. Strang's time at 80 miles was 1 hour, 15 minutes and 20⅗ seconds, and he finished the 100 miles, to which the race had been curtailed, in 1 hour 34 minutes and 1 second, as against DeWitt's 1 hour, 44 minutes and 22 seconds. The Cadillac suffered from magneto trouble, it was said, but at all events it kept in motion until the last lap, which, however, it did not manage to finish.

The timing apparatus being finally adjusted, the three heats of the race for the Sir Thomas Dewar Trophy were run, proving at once the redeeming feature of the day in the matter of speed, and incidentally furnishing a second runaway exhibition. The only two starters were Ralph DePalma and David Bruce Brown, the young New Yorker who is an amateur under the A. A. A. rules and a pro under A. A. U. rules and who last year established a record for 35⅗ for the mile. Brown's mount was the Benz racer which Hemery drove at Savannah last fall, and which commonly is credited with unlimited speed capabilities. DePalma's Fiat was no match for it, though it should be observed that the latter has had no previous experience in beach racing, and the three heats went to Brown respectively in 33⅕, 33⅗ and 33 flat, as against DePalma's 36⅕ and 36 flat.

Second Day—Wednesday.

Daytona, Fla., March 24.—Due probably to yesterday's "runaways" and to the long drawn out proceedings, the crowd present on the beach today was much smaller and the racing was not of keener interest. The last event to be run was stopped by nightfall when only half over, and unless something startling happens it is not unlikely that the crowd is likely to leave Daytona without waiting for the finish of the meet. As a matter of fact, that portion of it which was in evidence this afternoon, left the beach long before the "sport" was over. As has happened before at Florida meets, the officials have begun to get in each other's way—which may be supposed to presage further disappointments.

The best event of the meet so far, was the five miles invitation race between DePalma in the Fiat, and George Robertson who drove the big Benz racer, which latter, barring mechanical troubles is almost sure to sweep the beach clean. DePalma's Fiat while commonly recognized as a fast car, is by no means the equal of the monster Benz, while Kilpatrick's Hotchkiss, former Vanderbilt contender and holder of various road records, somehow has not been got into shape as yet, and has been witheld from all events. The story of the race is quickly told: Robertson, with the quickest start, led DePalma all the way, finishing in world's record time a hundred yards ahead of his competitor, in 2 minutes 45⅕ seconds.

De Palma and Brown were the only starters in the ten miles, free-for-all, and the latter won easily in 5 minutes, 14⅗ seconds. De Palma's time was 5 minutes 42⅕ seconds.

Due to bungling, the five miles southern price and horsepower handicap, as it was styled on the program, was started as a scratch race. Gus Grosjean, driving the Pope-Hartford entry, made a runaway of it, leaving Laughlin's Cleveland and Robertson's Locomobile to second and third place, respectively, the latter only beating the Cadillac home by about 6 inches. Myers came in last, in the closest race seen thus far.

Although it was growing late and a strong south wind was blowing, which was most favorable for short record flights, Referee Miles insisted upon calling the 200 miles piston displacement classification race. This was the last race to be run, as well as the most tedious and uninteresting of the day. De Palma, who was leading, stopped at 120 miles on account of the darkness. His time was 1 hour, 33 minutes, 44⅗ seconds. The only other starter in the class for engines of more than 460 inches piston displacement dropped out during the first lap on account of a broken piston, and may not be able to compete again during the meet. De Witt's Generalmotors stopped at an even 100 miles, having done the distance in 1 hour 39 minutes 27⅘ seconds. Lytle's Cadillac had gone only 60 miles when the race was halted; while Strang in the class for motors of between 321 and 400 inches displacement, finished the hundred miles in 1 hour, 30 minutes and 24 seconds

Several bicycle and motorcycle events also were run off and a number of new records therefor were credited.

The morning hours were enlivened by an automobile parade, which served to arouse considerable enthusiasm and created a welcome diversion. The enthusiasm was not sufficient to outlast the disappointment of the afternoon, however, and it looks as though moving day for the crowd was close at hand.

The summaries:

First Day—Tuesday.

Quarter-mile dash, bicycles—Won by Joseph Fogler; second, W. L. Mitten; third, E. F. Root. Time, 0:30⅕.

Two hundred miles, Florida stock car price class race (classes E and D reduced to 100 miles by agreement of contestants and referee)—Won by Lewis Strang, Generalmotors; second, George De Witt, Generalmotors. Time, 1:3401⅕.

One mile, Dewar trophy—First heat won by David B. Brown, Benz; second, Ralph De Palma, Fiat. Time, 0:33⅕. Second heat won by Brown, second De Palma. Time, 0:33⅘. Third heat won by Brown; second, De Palma. Time, 0:33.

One mile, record trials, motorcycles—Best time made by Walter Goerke in 0:45⅕ (world's record).

Second Day—Wednesday.

Five miles, invitation race between De Palma and George Robertson—Won by Robertson, Benz. Time, 2:45⅕ (world's record).

Ten miles, free-for-all—Won by David B. Brown, Benz; second, Ralph De Palma, Fiat. Time, 5:14⅗.

Five miles, southern price and power handicap (run as scratch race through error)—Won by Gus Grosjean, Pope-Hartford; second, James Laughlin, 3d, Cleveland; third, George Robertson, Locomobile. Time not taken.

Two hundred miles, piston displacement class race (stopped on account of darkness)—Ralph De Palma, Fiat, 120 miles, time 1:33:44⅗. George De Witt, Generalmotors, 100 miles; time 1:39:27⅘. Lewis Strang, Generalmotors, 100 miles; time, 1:30:24.

Half-mile bicycle—Won by Joe Fogler, Brooklyn; second, W. L. Mitten, Davenport; third, Eddie Root, Boston. Time 47⅕ seconds. (Record.)

One mile motorcycle time trial—Won by Oscar Hedstrom, 14 horsepower Indian. Time, 44⅗ seconds.

Five miles motorcycle record trials—Won by Walter Goerke, Brooklyn, 7 horsepower Indian; time, 3 minutes 30⅕ seconds. second, Robert Stubbs, Birmingham, Ala., 7 Indian, 3 minutes 33 seconds; third, A. G. Chapple, New York, 7 Indian, 3 minutes 52 seconds. (Record.)

Ten miles motorcycle—Won by A. G. Chapple, New York, 7 Indian; second, Walter Goerke, Brooklyn; third, William Wray. Time, 8 minutes 57 seconds. (Record.)

Two miles bicycle—Won by Joe Fogler, Brooklyn; second, Eddie Root, Boston; third, W. L. Mitten. Time, 3 minutes 45⅕ seconds.

Why the Sultan Bought in Quantity.

Much astonishment was caused by the fact that when the pillage of the palace of Abd-el-Tziz, the Sultan of Morocco, took place the invaders found therein twelve motor cars and a hundred bicycles. The explanation given for this is amusing. It seems that when the Sultan of Morocco wished to obtain a motor car or a bicycle he was informed that in Europe it was customary to sells cars only by the dozen, and bicycles only by the hundred. Believing implicitly in the veracity of his informant, he made his purchases accordingly.

Dirt a Mischief Maker in Casings.

Of the evil effects of permitting dirt and gravel to find its way into tire casings when making roadside repairs, much is heard in tire repair booklets and in advice to beginners. Nothwithstanding the prevalence of these bits of warning, however, it is the experience of the head vulcanizer at the factory of the Goodyear Tire & Rubber Co., that about 20 per cent. of the inner tubes which are sent in for repair, show signs of scoring as a result of carelessness in just this particular.

Toledo Show Testifies to Increasing Interest

Ohio's turn at the whirl of local automobile shows was renewed this week with the opening on Monday, 22d inst., of the Toledo show. The auditorium, which last season was amply large to hold the biggest local aggregation ever mustered in its line, now is just large enough for the purposes of the Toledo Automobile Dealers Association, which is holding the show, and indications point to a probable necessity of seeking more ample quarters another year, granting only a continuance of the expansion which has been witnessed during the past twelvemonth. As a matter of fact, there are something like four times as many cars on view as were shown a year ago, and nearly three times as many exhibits devoted exclusively to motor cars. Last year's show afforded representation to only seven different dealers. Now the representation has been swelled to nearly a score, while about 20 different makes of car are on view, covering a goodly share of the market and revealing in variety practically everything that the market affords. Accessories and supplies furnish the basis of nearly double the number of exhibits which are devoted to cars and the display is of the usual large variety.

In laying out the floor spaces Manager Shy C. Fisk, who is secretary of the dealers' association, has arranged the booths in three rows down the floor with an encircling series next the wall. The balcony is entirely devoted to the accessory and supplies people. By way of decoration, masses of white bunting are employed to conceal the gray walls of the building, while booths are ornamented with magnolia trees and various smaller potted plants, artificial and otherwise, in which here and there, concealed electric light bulbs help to shed a warmth of color and light upon the exhibits and tone down the unmasked glare of the overhead lights. Various amusement features, including the usual musical program, of course, serve to lighten the tedium of the show for the non-technical visitor. The list of exhibitors of cars, together with the machines they display, is as follows:

H. J. Adams, Reo, Kisselkar; Apperson-Toledo Co., Pope-Toledo; Atwood Automobile Co., Premier, Regal, Stoddard-Dayton, Velie, Overland, Waverley electric; Buick Motor Co., Buick; Central Auto Co., Maxwell, Mitchell; Gamble Motor Car Co., Baker electric, Rauch & Lang electric, Stearns, Peerless; Kirk Bros. Automobile Co., Thomas, Knox, Studebaker, E-M-F. Indianapolis Trade Holds Open House Week

Closely allied to a show week, and indeed, partaking of the nature of a "multiple-unit" show spread over the entire automobile territory of the city, Indianapolis, Ind., is this week enjoying a flood-tide of automobile enthusiasm. The fifteen dealers and eleven manufacturers who make up the local motoring contingent, have combined their efforts in making the week a profitable as well as a spectacular one. Today (Thursday) is to be signalized by a daylight parade of cars, old and new, decorated and otherwise, while all through the week "open house" is the rule. A series of gymkhana contests is another feature calculated to attract attention to the week's program, in addition to which a number of more or less impromptu speed, hill-climbing and endurance contests are promised or are in prospect, though none are regularly programmed.

The complete list of dealers and manufacturers who are participating in the event and are assisting the movement by extending a hearty welcome to all visitors as well as affording them an opportunity for demonstrations in endless numbers and unlimited amounts, is as follows:

Dealers.

Fisher Automobile Co., 400 Capitol avenue—Stoddard-Dayton, Overland, Maxwell, National, Empire.

State Automobile Co., 415-419 Massachusetts avenue—Oakland.

Indiana Carriage & Automobile Co., 27-33 North Capitol avenue—Jackson, Regal, Leader.

Chalmers-Detroit Automobile Co., 11 W. Walnut street—Chalmers-Detroit, Pierce Arrow.

Buick-Losey Co., 130-132 East New York street—Buick.

Willis-Holcomb Co., 330-332 North Illinois street—Apperson, Packard, E-M-F.

Motor Car Sales Co., 330 North Illinois street—E-M-F.

Gibson Automobile Co., 238 Massachusetts avenue—Premier, Reo, Ford, Marion.

Hearsey-Willis Co., 113-117 West Market street—White steamer, Waverley electric, Rambler, Mitchell.

Cadillac Automobile Co., 23 East Ohio street—Cadillac.

Finch & Freeman, 33 South Capitol avenue—Haynes, Auburn, Richmond.

Morton-Place Garage, 1840 North New Jersey street—Moline.

Indianapolis Automobile Co., 115 West Maryland street—Cartercar, Gyroscope.

Indianapolis Motor Car Co., 423 East Market street—Rapid motor trucks.

Nordyke & Marmon Co., Meridian and New York streets—Marmon.

Manufacturers.

National Motor Car Company, Twenty-second and L. E. & W. Railway.

Overland Automobile Co., Oliver avenue and Drover street.

Premier Motor Car Co., 221-225 South Shelby street.

Marion Motor Car Co., 742-750 East Washington street.

Cole Carriage Co., 950 West New York street.

American Motor Car Co., 420-430 South Illinois street.

Nordyke & Marmon Co., Take Stockyards cars, Morris street and Kentucky ave.

Waverley Co., 139 South East street.

Irvin Mfg. Co., Tenth street and canal.

Wheeler & Schebler, Shelby and Sanders streets.

G & J Tire Co., 549 East Georgia street.

Syracuse Stages Many Exhibits at First Show

Under the experienced management of Dai H. Lewis, secretary of the Automobile Club of Buffalo, the first automobile show to be held in Syracuse, N. Y., opened in the State armory yesterday (Wednesday) to continue to the end of the week. Contrary to the customary conditions attendant upon the holding of maiden local shows, the entire amount of space available in this instance was oversubscribed in advance, as has been the case this season with practically all the established local shows, so that with the opening, the exhibition was as complete as its space limitations would permit. Indeed, so successful have been the efforts of the Syracuse Automobile Dealers Association, that the products of something like 30 different factories are represented, while the actual number of machines on view numbers close to a hundred. Besides, there are the accessory exhibitors who have flocked to the show standard in characteristic numbers, bringing their own peculiar glow of enthusiasm and optimism to the show.

Pride of place naturally goes to local enterprise in the Franklin exhibit, which is one of the most extensive as well as one of the most patronized of the various booths. Although this is Syracuse's first full-fledged

Digitized by Google

show, in the sense of an exposition of the products of a considerable number of makers, the entering wedge was driven last year, when the H. H. Franklin Mfg. Co. instituted a show of its own, failing to arouse sufficient interest to secure a more general display. Thus in a sense, this is the second instead of the first, local show in that vicinity.

The program of the show, though limited necessarily to four days, yet partakes of the usual gala element in the consecration of each of the days to special groups of visitors. Thus, Wednesday was "Administration and Manufacturers' Day," today figures as "Mystique Krewe Day," tomorrow will be "Society Day," and Saturday "'Varsity Day."

Louisville Now Plans Eight Shows.

With a true spirit of perseverance that augurs well for the success of the event, the Louisville (Ky.) automobile dealers are going ahead with their plans for the automobile show, which is to be held April 15, 16 and 17, despite an unforseen setback. Fire recently destroyed the Coliseum where the exhibition was to have been held, and it seemed that the lack of a suitable hall would prevent the holding of the show. This apparently insurmountable difficulty was met by an agreement that each dealer should decorate his show rooms in a manner similar to what was contemplated at his space in the Coliseum. Eight dealers have acquiesced in the proposal, so that Louisville will have eight shows instead of one. Automobiles will be furnished to carry the visitors around to the different garages, and admission will be free to all exhibits.

Show for Motorists and Horsemen.

Contrary to the usual procedure at automobile shows, when the motor car is the center of attraction, the horse will share the honors with its rival at the coming exhibition of equines and motor cars at Newcastle, Ind., April 1st, 2d and 3d. Lovers of the horse have combined forces with the devotees of the power wagon, to promote a show, and from the enthusiasm which is being manifested, the amalgamation of the interests concerned will militate greatly for the success of the exhibition. Many horse owners who otherwise would not be attracted by an automobile show, will take in the exhibition and offer a fruitful field for the automobile dealer.

Atlanta Plans Show for Autumn.

Considerable agitation in Atlanta, Ga., for the holding of an automobile show has resulted in a resolution to defer the project and endeavor to secure an early fall dating, as soon after November 1st as is possible, in fact. Action has been taken in the matter by a joint committee of the Fulton County Automobile Club and the newly organized Atlanta Automobile Trade Association, which has named a conference committee consisting of President E. W. Gans, of the dealers' association; Ed. H. Inman, J. J. Cohen, Clark Howell, G. W. Hanson, J. H. Nunnally and Charles I. Ryan, to arrange with the associations of automobile and accessory manufacturers in New York City for a suitable date and a sanction.

Hartford Show Yields a Dividend.

Emulating the New York example, the Hartford Automobile Dealers Association has declared a dividend to the exhibitors at the recent Hartford automobile show. The report of the show committee discloses gross receipts of $6,008.04, and disbursements amounting to $4,420.14, leaving a balance of $1,588.26. As a result a return of 39⅞ per cent. was awarded the dealers and one of 36.43 per cent. to the exhibitors of accessories. Last year a 92 per cent. dividend was declared, but the show this year was more elaborate.

Logansport Fixes Dates for Show.

Inspired by the successful promotion of automobile shows in other cities, Logansport, Ind. proposes to enter the rapidly expanding show circuit. The Logansport Automobile and Motorcycle Dealers Association is back of the project, and April 1, 2 and 3 have been selected as the dates for the event, and the Broadway garage is the location chosen. A goodly share of the leading cars and motorcycles will be shown and all available space has been taken.

Germany's Imports and Exports.

Foreign cars and parts to the value of $3,275,750 were passed through the German customs last year as against $4,458,750 in 1907. To offset this the Fatherland sold to other countries cars and parts valued at $3,406,250 in 1908, an increase of $125,000 over the preceding twelvemonth.

Taunton to Have Taximeter Cabs.

The Taunton Taxicab Co. has been formed in Taunton, Mass., with headquarters at Carlow's garage. Five machines will be bought to start, and the equipment will be increased as fast as increasing patronage seems to warrant.

Taximeter Cabs Popular in Germany.

In the land of the Kaiser taximeter cabs are rapidly winning their way into popular favor. Berlin now has over 2,000 of the "scooters" and other cities in the empire are fast adding to their quota.

Cab Service Planned for Indianapolis.

Charles W. Sheets & Son are arranging to operate a taximeter cab system in Indianapolis, Ind. The headquarters of the enterprise will be at 1015 North Capitol avenue.

Tensile Strength of Vanadium Steel.

"The gain in toughness and strength of steel, due to the introduction into the construction of a small percentage of vanadium, is shown in some recent comparative tests of a carbon steel frame of 78,000 pounds tensile strength and 46,000 pounds elastic limit, and a frame of similar section with vanadium added to the steel composition," says the Scientific American. "The vanadium steel frame section, carried on supports four feet apart, stood twenty blows of a 5,000 pound weight falling from a height of 18 feet, before fracture took place. The carbon steel frame section was deflected 5½ inches by the first blow and broke on the second. In the whole series of tests the vanadium steel showed about 15 per cent. higher tensile strength and 25 per cent. greater elastic limit than the carbon steel."

America's Share in Australian Trade.

According to a customs report recently issued, 3,559 motor vehicles were imported into Australia from 1901 to 1907. Of this total 1,175 went to New South Wales, 1,436 to Victoria, 132 to Queensland, 496 to South Australia, 224 to Western Australia, and 96 to Tasmania. The total import value of these vehicles was $3,392,125, and the duty paid on them amounted to $701,105.

Of the total number of automobiles imported during the years stated, no less than 398 were imported from the United States. In the year 1903 the United States sent to Australia 71 automobiles, valued at $35,262; in 1904, 161, valued at $75,586; in 1905, 122, valued at $63,799; and in 1906, 44, valued at $37,841. The figures for 1907 are not yet complete, nor is it possible to get the figures for the first three quarters of 1908.

Motorcycles imported during the nine months ended September 30, 1908, were valued at $59,361, the duty being $16.881. Bodies for automobiles, motor trucks, and wagons, valued at $135,011, were imported during the same period, the duty amounting to $45,954. There were further imported during the nine months under review chassis for automobiles, motor trucks, and wagons of a total value of $933,394, and the duty upon these amounted to $22,439.

Making Belgium Roads Fast and Safe.

Considerable attention is being given to the improvement of the roads by the government in Belgium. In the future the line of new roads will be laid out to secure a radii of 328 feet as a minimum for country roads. This minimum will be reduced to conform to local conditions, where the road passes through cities and towns. The roads will avoid grade crossings and swinging drawbridges, and be so planned as to open up branch avenues of travel at their juncture with the trunk lines. Where conditions are such as to be misleading to tourists regarding the direction to be taken, the by-roads will be concealed by the arrangement of trees, or special forms of construction marked with legible signs. Of ample width, with easy grades, and conducive to high speeds, and so built as to withstand heavy traffic, they will have feeders to take care of local traffic in small centers.

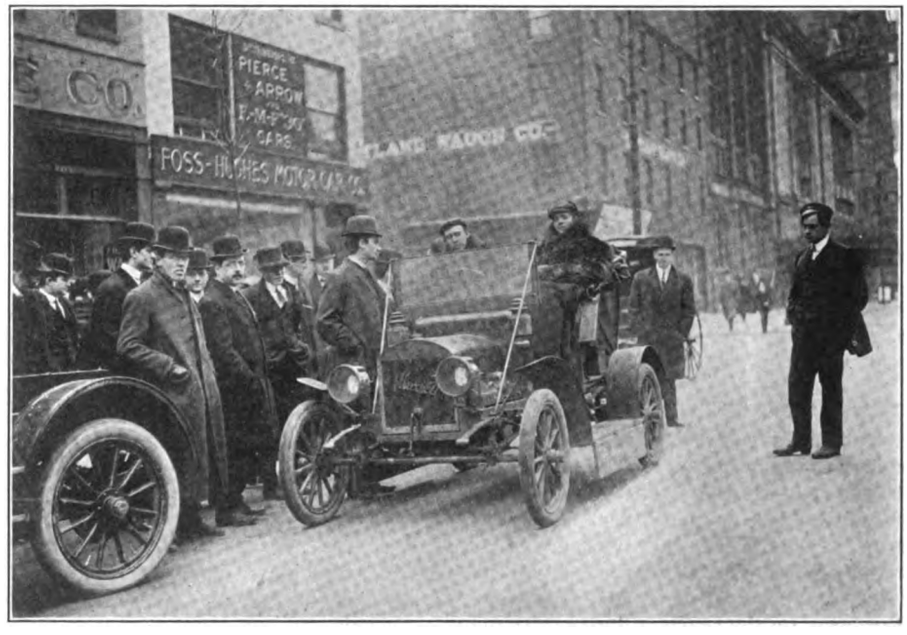
NON-STOP TESTS WITH VARIATIONS

Air Cooled Motor Runs 60 Hours with Car Standing Still—Two Thousand Miles Run on City Streets.



With the approach of the open touring season the popularity of the manufacturers' and dealers' demonstration is waxing strong, particularly where in the guise of endurance run or contest it may serve to call to the attention of a great number of people the peculiar merits of the cars under trial. Just here is revealed something of the progress which has been made in car building during the past few years. Where only a short time ago, relatively speaking, public demonstrations for the most part were confined to runs between well known points, sometimes for speed and sometimes for endurance purposes, now they are largely devoted to tests of endurance placed on a mileage or time basis, and therefore possessing quite as much general as local interest. Furthermore, the advertising art is being brought to bear with increasing consistency upon these efforts at publicity with most successful results.

FRANKLIN IN 60-HOUR NON-STOP MOTOR TEST

Thus, for example, the people of Kansas City were treated to the sight of a diminutive colored lad seated astride the bonnet of a Franklin car standing in front of the local agency the other day. Swathed in a heavy blanket and beaming in indolence and comfort he was banked by various signs which indicated that a 60-hour non-stop test of the motor was in progress. Because of the old-time superstition as to the unreliability of air-cooled engines in general, and because of the popular belief that they always "run hot" when they run at all, a placard in front of the lad—which also explained his presence in that unusual position—read: "T'aint hot! 'f t'was, Id move."

The test, which was applied to a 28 horsepower stock car, was carried out in front of the headquarters of the Franklin Motor Car Co., at 1108 East Fifteenth street. It began Monday morning and did not end until Wednesday night; during which time only 1½ gallons of oil and 28 gallons of gasolene were used, although the motor was run at a good rate from start to finish.

MAXWELL, JR., ON COMPLETION OF 2,000 MILES NON-STOP RUN

A sixty-mile as well as a sixty-hour test was made to round out the demonstration. In running the sixty miles the car carried five people about Kansas City, the run being made in eleven hours at the rate of 5 5-11 miles an hour. The entire course was covered on the low speed, which is geared at 12 to 1. Had the run been made on the high speed with the engine making the same number of turns, the distance covered would have been 225 miles, as was carefully explained to the spectators. The low gear trial was adopted, naturally, as being a better test of the cool running properties of the motor.

Philadelphia last week was the scene of a hardly less ambitious endurance test of the demonstration variety, when a Maxwell Junior car was made to do a 2,000 miles non-stop run up and down Broad street. Running in city traffic is a hard test for any vehicle, but no one can begin to appreciate the strain which is thrown upon both the car and its driver who has not attempted to complete not merely one or two brief down-town or cross-town runs, but a long distance under non-stop conditions. Notwithstanding the rigorous nature of the test, however, the machine survived and was sent over the road to Pittsburg, where the trial ended, without the necessity of a single motor stop. But even this test appears not to have been severe enough to suit the tastes of this particular maker, as is shown by the fact that in another locality another non-stop performance is being carried forward.

Ten thousand miles without stopping the engine is the stupendous task allotted to a Maxwell car by the Boston agency, to prove its utility, this being an instance of another type of modern and popular demonstration. On Thursday last, a four cylinder 30 horsepower car left the headquarters of the Bay State Automobile Association with Lucius Tyler at the wheel, and Adam Schneider as observer, in an attempt to do the 100 century non-engine stop run. L. R. Speare, the newly elected executive head of the A. A. A., started the engine on its long

Digitized by Google

run, the ceremony attracting the usual audience of passing pedestrians.

The car will be kept going night and day until the completion of the 10,000 miles which is expected to take three weeks. Drivers and observers will be changed every eight hours to relieve the monotony of the grind, and the constant strain of keeping the engine running. No attempt at high speed will be made, as the main object sought is to keep the engine running for the allotted distance, and fast driving might lead to accidents which would cause all preparations to go for naught. For the first week the car will be driven to Worcester and return. The second week the course will be changed to Providence and back, while the final week will be spent on the Boston and Newburyport route. The car will be checked at both ends of the course on each leg of its journey. Up to noon Wednesday the distance traveled by the car was 2,606 miles, as shown by the cards of the official observers, and the distance had been accomplished without adjustment or trouble of any sort, and, of course, without a single stop.

Adjusting Pressure in the Tires.

Once the average owner has been educated up to the point of appreciating the necessity of maintaining a uniform degree of inflation in his tires, the question naturally arises as to whether the same pressures should be employed in hot as in cold weather. To this, a well-known tire expert replies that they should, notwithstanding the differences in atmospheric temperature. On this account, however, the rise in pressure due to friction caused by the kneading of the walls will be much greater in summer than in winter, so that some method of equalization is necessary. To this end, it is suggested that in warm weather tires which have been newly inflated be gone over after having been run long enough for normal conditions to become established, and the pressures tested by means of a suitable gauge. If the pressure in any tube is found to be higher than the normal amount recommended by the maker of that particular tire, it may be relieved by letting off a portion of the air.

Card for the Atlanta Hill Climb.

Atlanta, Ga., is fairly bristling with excitement these days, for on Saturday next, 27th inst., the Fulton County Automobile Club will hold its annual hill climbing contest up Stewart avenue hill. Because of the proximity of Daytona, it is expected that several of the crack speed merchants who will perform on the beach will go to Atlanta, Barney Oldfield, Lewis Strang, and Charles Burman already having entered cars. Seven events are carded, as follows: For touring cars of runabouts costing $900 or less, touring cars or runabouts costing $1,500 or less; touring cars or runabouts costing $5,000 or less, runabouts costing $5,000 or less, and free-for-all stripped cars.

PUSHING CHICAGO CARNIVAL PLANS

Local Club Takes Steps to Avoid Friction with A. A. A.—New Dates Fixed for Middle of June.

A slight misconception of the newly assumed function of the American Automobile Association in its complete domination of racing control has caused a temporary halt in the plans of the Chicago Automobile Club, which has been so eagerly fostering the scheme of a national stock car race to take place in the latter part of May. Despite the fact that the club through its active committees was doing all the work of developing the race, and that the preparations had been advanced even to the point of practically settling upon the date, the course and the nature of the race, the prospect that at the last moment the A. A. A. would step in and assume full control of affairs, even to the appointment of officers and the dictation of the rules for the contest, served to bring about an abrupt alteration in the status of the event. Although the proffer of the Cobe trophy by President Ira M. Cobe, of the Chicago Club, had been accepted by the executive committee of the A. A. A. upon the basis of its being held for national competition, the resentment of the Chicago club members was so strong that they immediately determined to make the event a local one, clipping off the term national and changing the date.

Despite this change in its status, however, the affairs of the race or speed carnival as it is called, are progressing favorably. It is now slated to occur on June 18 and 19, instead of May 29 and 31, as at first planned, and as a western event, it will be run entirely under the management of the Chicago club. The rules which are being formulated by the A. A. A. contest board under the direction of the Manufacturers' Contest Association will be recognized, and the program will consist of a light car race to be run on the first day in all probability, while the entire second day will be required for the contest of 250 miles or thereabouts for the Cobe trophy. Practically the only difficulty now remaining is the securing of a militia guard for the policing of the course, and this being assured, it is practically certain, it is said, that the A. A. A. will not delay in granting a sanction under the new terms.

That all was not going smoothly with the plans for the race as they originally stood, is revealed by the intimation that the eligibility rule made it necessary for the entry of a stock car, that at least 25 duplicate machines should have been produced by the same maker. This, as precluding the possibility of trying out 1,910 cars in the contest, put something of a damper on the enthusiasm of the promotors. The proposed engine limitations also were criticized, it is said. Furthermore, it was feared that the weather would not have become sufficiently settled by the end of May for the course to be put into the best shape, while the delay in formulating the rules was threatening embarrassment to the potential entrants who, presumably required more than a few days of preparation for as ambitious an event as originally had been planned.

As matters now stand, the race seems likely to be run about as originally planned, save that its management will be more to the liking of the contest committee of the club than would have been the case had the A. A. A. been allowed to step into the position of command. Makers, it is thought, will be likely to take just as much interest in the event under its new guise as would have been the case had it remained national in name, particularly as so much interest just now is centered in the western market. Altogether, the matter appears to have been adjusted without serious friction on either side.

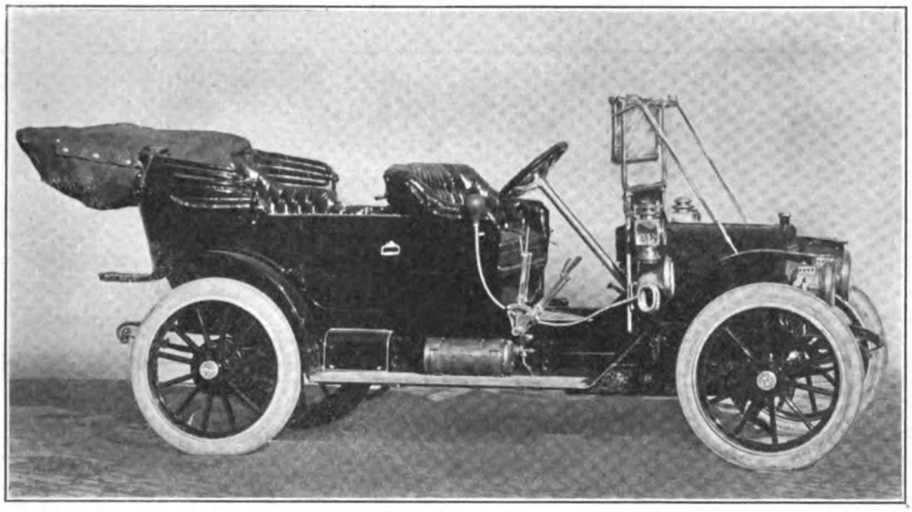
Wilkes-Barre Planning Large for Its Meet.

That the Wilkes-Barre (Pa.) Automobile Club intends to make this year's hill climb up Giant's Despair mountain of more importance than any of its predecessors, is evident from the early preparations that are being made in anticipation of it. As usual the slimb will take place on Decoration Day, May 30th, on the now famous course which runs up the south side of Giant's Despair—which prior to the first hill climbing contest held upon it was locally known as Wilkes-Barre Mountain.

The nature of the course and the splendid arrangements that always have marked the annual event leads not only members of the Wilkes-Barre club, but many others, to believe that it is one of the ideal courses, if not the very best roadway in America for such a contest.

The club already has begun the preliminary work for the climb which they hope to make an event of national importance. It is hoped to induce the various clubs throughout the East to promote club runs or endurance contests to finish in Wilkes-Barre the day before the hill climb, and several public spirited citizens of the Diamond City already have intimated that if the plan is put into effect trophies will not be lacking. The committee expects that runs will be made from New York, Buffalo, Pittsburg, Philadelphia, Baltimore and other cities.

Plans 10,000 Miles Run on Track.



Among the "stunts" being planned for the new motor track at Indianapolis, Ind., when it is completed, is an effort to make 1,000 miles per day for ten consecutive days. The car which will attempt the feat will be a National, the makers of which, the National Motor Vehicle Co., of Indianapolis, have had no little success in similar record making attempts in the past.

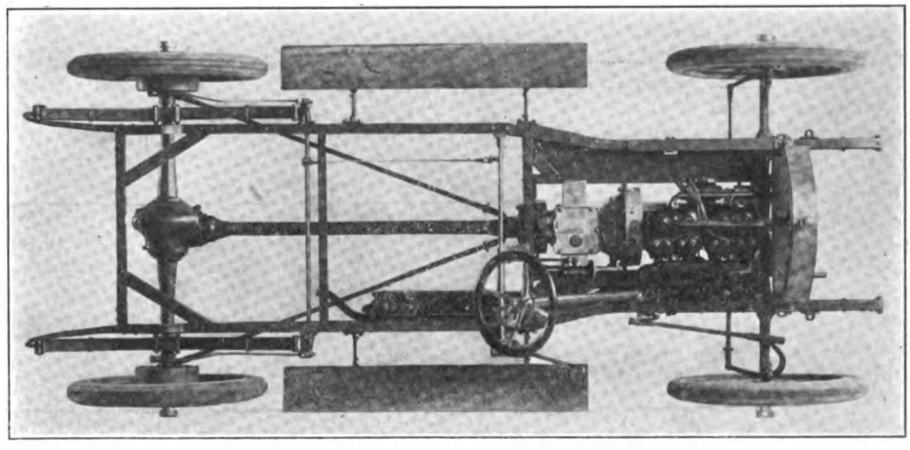
FEATURES OF THE HERRESHOFF

Its Neatness, Compact Construction and Large Capacity—Thoroughness Shown in the Specifications.

One of the new cars to receive marked attention in connection with the recent Boston show, quite as much because of its neat and condensed construction as because of its novelty, was the Herreshoff—a machine



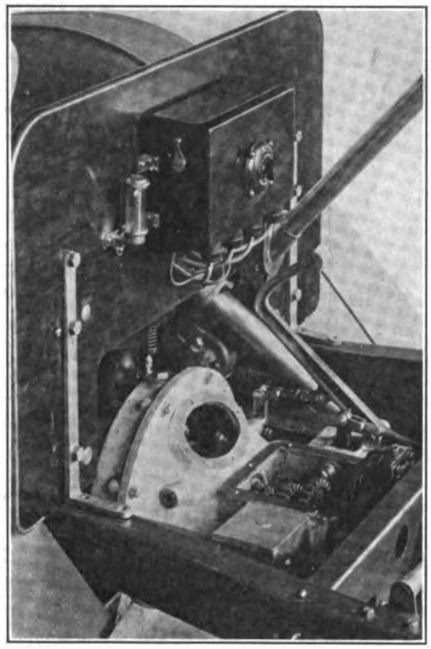
HERRESHOFF 24 H.P. TOURING MODEL

which has been looked forward to with considerable curiosity since the first announcement of its advent, made exclusively by Motor World some months since, and which is made by the Herreshoff Motor Co., Detroit, Mich. Nor did its appearance in any way prove a disappointment to those who had anticipated an attractive offering as well as a practical one at the hands of its designer and builder. Light and compact appearing, if anything, small for its rated capacity and power, it was seen that the term "light cob" which had been applied to it was far from a misnomer, as it is intended to fulfill just the purpose in the private garage which the peculiarly sturdy and efficient horse of that class fulfills in the equine establishment.

Further details of the machine which were not available during the rush of show week, bear out early impressions as to the thorough going manner in which its specifications have been chosen and worked out. By dint of much close figuring a far greater ratio of passenger carrying space to bulk of power plant has been secured than commonly is found in large cars, while the external lines are perfectly in accord with current practice save that they are worked out with an eye to compacting the mechanism as far as possible. The unit power plant, for example, though containing all the elements found in many cars of much larger size, is made to occupy only the limited amount of space encompassed by the very short bonnet and the reach directly back of the dash and under the floor boards. In fact, the cross frame member which supports the forward end of the torque tube and serves as the midriff of the chassis, is placed at somewhere about two-fifths of the distance between the radiator and the rear axle instead of back of the center, as is commonly the case.

By this means the rear of the chassis is kept perfectly clear of mechanism, while the forward portion, which is narrowed down, and suitably reinforced, is made to withstand practically all the torsional stresses which result from the application of the power to the driving group. As a matter of course, the axle group in the rear is suitably braced by means of long strut rods which run forward from the axle ends to the articulation of the torque tube with the frame, the axle itself being afforded a floating attachment to the frame by means of the shackling system adopted.

HERRESHOFF CHASSIS, VIEWED FROM ABOVE



The motor is of the quadruple, vertical type, employing thermo-syphon cooling circulation, double ignition with accumulators and Bosch magneto, rated at 24 horsepower nominal output, and measuring 3⅜ by 3¼ inches, bore and stroke. Together with the gear box, which is encased in an integral housing, it is mounted on a short subframe. The valves are offset from the cylinders, mounted side by side on the right side of the motor, and actuated conveniently from a single cam shaft. The two sets of spark plugs are carried over the valve pockets, while the carburetter and piping manifolds being located on this side as well, ample space is left on the other side for the mounting of the magneto and the single vertical pillar, which is used for the mounting of the timer for the jump spark battery system, and for the lubricating pump drive. Engine oiling is accomplished by means of a constant flow system, circulation for which is maintained by means of the pump from a sump in the lower part of the engine base, through a single sight-feed glass, and to the various shaft bearings. Annular ball bearings of the F. & S. type are employed for both crank and cam shafts.

The change gear group which, as already mentioned, is carried in a housing held solidly with the engine base by means of a series of bolts which secure the fly wheel casing to the end of the gear box, is of the progressive type, affording three forward speeds with the reverse, the top speed being through a direct drive through to the propeller shaft. A heavy service brake is mounted on the drive shaft back of the gear box and just in front of the universal joint, and is actuated by an arm extending from the single pedal lever. This pedal, it should be observed, is so inter-connected with the multiple disc clutch, as to release that member upon a slight depression, applying the brake when brought to the limit of its travel. This, with the foot accelerator completes the control arrangements on the foot board.

The rear axle, which is of the floating type, is Timken mounted, as also is the front axle. The wheels are 32 inches in diameter, shod with 3½ inch quick detachable tires, and the wheel base is 100 inches. The frame is of pressed steel, with long spring horns in the rear, a peculiarity of its formation being the very short radius of the offset which is used to secure ample

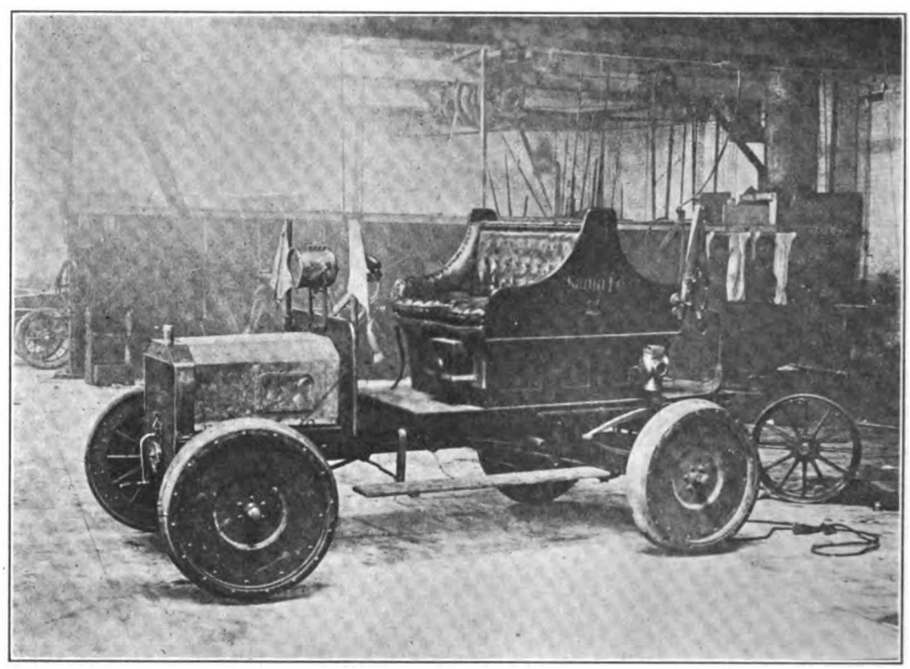
Digitized by Google

clearance for the rear axle, and which is unusual in that the offset is completely filled with a rubber buffer. The spring suspension is of the semi-elliptic order, front and rear, the front members which are 34 inches in length being in marked contrast to the rear ones which are no less than 52 inches long The car is produced in both runabout and touring types, as well as lan-

HERRESHOFF TRANSMISSION MOUNTING

daulette and coupe, in the former instance, the fuel storage being in a rear-mounted tank with pressure feed, while in the touring types the tank is carried under the front seat from which the feed is by gravity. In either pattern of body mounting, the control mechanism is placed on the right side of the car, spark and throttle control being located on the top of the steering column, though the throttle is interconnected with the foot accelerator already mentioned, while the magneto is made to run with a fixed point of ignition, so that the spark lever applies only to the battery and coil system which is a stock feature of the machine. As is customary, the gear striking lever is mounted at the end of the foot board, while outside it is the emergency brake lever, which applies the internal expanding brakes on the rear wheels. The complete weight of the machine is given as 1,575 pounds for the touring car, or 1,495 for the runabout.

Advantage of a Petcock in Drain Pipe.



If the water in the cooler is to be drawn off, it is well to have more than one pail handy if there is no shutoff on the drain pipe, as it is no easy matter to put the plug back when there is a pressure of water in the pipe. When no petcock is fitted the convenience which one affords should be an incentive to procure its attachment.

ADAPTING MOTOR CAR TO RAILS

How a Ford Runabout has Been Transformed for Railway Inspection Service —Its Satisfactory Performance.

While motor cars have been used to perform unusual tasks of all sorts outside of their regular field and have unfailingly made good, it is in the development of the self-propelled vehicle for railway inspection work that it finds a particularly fitting application. Many specially built machines have been employed in this field, but comparatively few, which are transformed touring cars or runabouts.

The car shown in the accompanying illustration, which is of the latter and therefore unusual order, is a Ford runabout which was fitted with flanged steel wheels and used in the service of the Santa Fe system, for

FORD RUNABOUT TRANSFORMED FOR RAILWAY INSPECTION

track inspection, trouble wagon and general utility work, and has covered 40,000 miles. By its ability to attain much higher speed, and the wide radius of trackage which it can cover in a limited time, it has demonstrated the great superiority of the mechanically propelled over the hand propelled type of car for this class of work.

The transformation process necessary to fit the machine for railway work, it will be observed, was neither a serious nor troublesome undertaking. In addition to the substitution of the flanged wheels for the regular equipment of the automobile, the front axle was stiffened by the elimination of the knuckles, the body was supplanted by one having dos-a-dos seats, and new running boards were installed. These, with the removal of the steering column and a slight rearrangement of the control mechanism, proved all the alteration which was necessary.

Readjustment of Lubricating Scoops.

One system of engine lubrication which is rather common involves the use of scoops made of thin metal and attached to the "big ends" of the connecting rods in such a way that at each down stroke a small amount of oil will be picked up from the oil well and thrown up against the under side of the journal. In arrangements of this sort it is evident that the amount of oil which reaches the bearings must depend upon the depth to which the scoops sink in the oil wells—supposing the latter to be fed uniformly and the level in them properly preserved. If one of the scoops happens to be improperly adjusted or is bent up ever so slightly, as may result from careless handling in overhauling, for example, the result will be a corresponding starvation of the bearing which it is supposed to feed. On this account great care should be taken in repairing machines in which this method is employed, in order that the proper distribution of the oil be not affected.

Compound to Remove Carbon Deposit.

Innumerable compounds for removing carbon deposits from the cylinders and pistons have from time to time been invented, each claiming to possess qualities superior to any other. However, several owners who have tried the following method unite in saying that it gives excellent results. Here it is: Put an ounce of baking soda into each cylinder, then add one-fourth of a pint of kerosene and turn the engine over a few times to thoroughly soften the deposit.

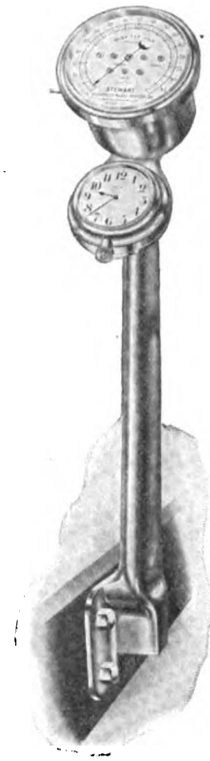
WHAT A BIG FACTORY CONSUMES



The Great Quantities of Raw Material Required for a Season's Output—Amazing Array of Figures.

Just how much raw material is involved in the production of a season's output of motor cars is beyond the appreciation of the average owner, even were he able to figure the actual amounts involved in the assemblage of the finished product. Some idea of the stupendous nature of the undertaking of building cars in large lots, however, may be gained from the following figures which are vouched for by the official statistician of the Maxwell-Briscoe Motor Co. In preparing for the production of 12,000 Maxwell cars, bids are being solicited on materials, as follows: Aluminum castings, 200 tons; brass castings, 150 tons; babbit metal for bearings, 50 tons; brass tubing, 126,000 feet, or approximately 25 miles. The rivets used in building this lot of cars will weigh something over 30 tons, while for materials other than metal, bids are required on 13,000 hides to be used for upholstering and trimming, and material for top coverings, to the extent of 40,000 yards. Steel in bar stock will be required to the extent of 1,000 tons, and malleable castings, 800 tons. Of the special metals, there will be used no less than 50 tons of chrome nickel, and 50 tons of nickel steel.

Speedometer on Independent Standard.

Mounting the speedometer on a separate standard of its own at the side of the car instead of on the dash is the idea disclosed in the new Model 14 Stewart which is being offered by the Stewart and Clarke Mfg. Co., of Chicago, Ill. The standard or bracket that is used has a steel core inside by which the drive is communicated to the speed indicating mechanism. The core has a bevel gear connection with the flexible shaft at the bottom of the standard. The arrangement eliminates the necessity of sharp bends in the shaft, since the latter is called upon for no other service than from the front wheel of the car to the bottom of the standard.

As shown by the accompanying illustration, the device fastens to the outside of the car frame, usually at a point forward of where the gear change levers are located, so that the readings will be convenient to the driver's eye no matter how fast the machine is going. A Stewart speedometer Model 11, of the 60-mile, multipolar type, is used for the speed and distance readings while the time is supplied by an eight-day automobile watch. Complete with the brass finished standard and all necessary shaft and gearing, the combination sells for $75 at retail. Further new combinations which the company has brought out include Model 15, a combination of speedometer Model 12, centrifugal type, and an eight-day watch, the latter mounted on top of the speedometer, price $25; Model 16, a combination of multipolar speedometer Model 11, having diamond bearings and a 90-mile scale, with

NEW MODEL STEWART SPEEDOMETER

an eight-day watch, price $90; and Model 17, a combination of the 90-mile multipolar Model 11, with a Chelsea clock and electric light, price $125.

Muffler of a Multiple Unit Type.

What might be described as "multiple unit" construction is employed in the new Powell pressed steel mufflers for 1910, made by the Powell Muffler & Timer Co., Inc., of Utica, N. Y. As many units as are necessary can be assembled into one muffler, to suit the requirements of the particular motor to which it is applied. To provide the greatest range necessary, however, the mufflers are supplied in two diameter sizes, the smaller being 5 inches and the larger 6¾ inches. The small mufflers are made of 20 gauge and the large size of 16 gauge steel.

From the photographic reproduction herewith it will be seen that the alternate discs composing the units form both the baffle plates and the outside casing. It has been the aim of the manufacturers to have the opening through the muffler as large or larger than the exhaust pipe from the motor, to eliminate back pressure and at the same time have effective suppression of the noise. As is also shown, protection from the heat is provided for the tie rods. The two main features of difference that are claimed are that it can be easily cleaned and that the total area of the baffle plates may be changed to correspond with the motor on which the device is used. By removing the end bolts on the tie rods, the muffler is readily separable either for cleaning or for alterations in the number of baffle plate units.

Night School for the Remy Forces.

In order that new acquisitions to the office and factory forces may quickly become familiar with the systems in vogue with the least possible derangement of the regular routine, the Remy Electric Co., of Anderson, Ind., have established a night school for their instruction. The classes are held two nights a week and are well attended by the employes, who have exhibited much enthusiasm at the innovation, which is the first known instance of the adoption of an educational campaign of this sort by an ignition appliance factory.

At present the topics under discussion are of a mechanical nature and comprise the motor ignition systems in general and covering both American and foreign practice. These instructions are being conducted by the chief engineer and his assistant. When the mechanical end has been well covered the classes will be turned over to the sales manager and his assistants for a thorough schooling in the selling branch of the business. In the opinion of the executive head of the company this policy of co-operation between the employes and manufacturer is bound to be productive of greater loyalty and efficiency on the part of the men and contribute largely to the success of the enterprise.

New Quick Detachable Rim Announced.

Requiring but one set of reversible side rims for both clincher and quick detachable tires, a new quick detachable rim is to be brought out by the Goodyear Tire & Rubber Co., of Akron, Ohio, for the 1910 season, according to an announcement which the company has just made. No complete description of the rim is as yet offered, but in design it is said to differ entirely from anything else on the market. A limited quantity will be supplied to manufacturers for testing purposes during the latter part of the 1909 season.

POWELL MUFFLER OF MULTIPLE UNIT CONSTRUCTION

PLANS OF CONTEST ASSOCIATION

The Organization Reports Progress—Its Action Concerning the Cobe Trophy—Code of General Rules Drafted.

At the end of the first month of its existtience, the Manufacturers Contest Association has made the first public announcement of its plans for the oversight of the government of automobile sport, incidentally promising to submit shortly to the contest board of the American Automobile Association, through which its activities will be exercised, a series of classifications which shall govern all competitive tests during the season of 1909. Already, it has submitted to the contest board its findings in regard to the conduct of the contest for the Cobe Trophy, the stock chassis race which is to be held near Chicago some time in the latter part of May, and the complete rules for that event are consequently expected to be issued within a short time.

Hereafter, it is stated, the classification and rules committee of the M. C. A. will submit to the contest board its recommendations for classifications for all contests for the ensuing year not later than August 15th, in order that the contest board may have opportunity to get them into shape to be announced not later than the first of September in order that the manufacturers may be enabled to get their cars in shape before the commencement of the racing season.

These announcements were contained in a circular issued by the M. C. A. late last week and reciting the complete history of the association from the preliminary organization of a committee of seven representatives of manufacturers and importers at the culmination of a series of mass meetings held in New York, to the final organization and recognition of the association at the meeting held in Chicago on February 10th, and the ratification of the plan two days later. Following the election of officers and the appointment of an advisory board composed of representatives of the three associations of the American manufacturers and the Importers Salon, as told by the Motor World at the time, a rules committee consisting of representatives from 25 concerns was appointed.

The interests represented in this way are the following: Apperson, Buick, Chadwick, Chalmers-Detroit, Fiat, Ford, Isotta, Itala, Knox, Locomobile, Lozier, Maxwell, Mitchell, National, Panhard, Pennsylvania, Pierce, Premier, Rambler, Renault, Reo, Stearns, Stoddard-Dayton, Thomas, White.

From this list of 25, H. E. Coffin, chairman of the rules committee, selected a working committee of five in addition to the chairman, as follows: F. B. Stearns, The F. B. Stearns Co.; A. L. Riker, Locomobile Co. of America; Edgar Apperson, Apperson Bros. Automobile Co.; Paul Lacroix, Renault Freres Selling Branch; George A. Weidely, Premier Motor Mfg. Co.

The plan of action, which already has been put in force, conprehends the formation of recommendations for the rules by the working sub-committee, and the submission of its action to the committee of 25 for its approval. Following a thorough digest of the proposed measures by this committee, the final report will be submitted to the contest board of the A. A. A., for ratification by that body and subsequent adoption.

In accordance with this plan the recommendations for the conduct of the Cobe Cup race were referred to the contest board of the A. A. A. following a meeting of the rules committee of the M. C. A., held in New York on March 5th, while the preliminary draft proposed as a basis for the 1909 rules which shall govern all competitions in the United States, will be presented to the 25 members of the general rules committee within a few days. The Manufacturers Contest Association is now in process of incorporation, and it is announced that applications for membership, conditions of eligibility, etc., will be issued withn a short time.

The officers of the association, chosen at the Chicago meeting are: Benjamin Briscoe, Maxwell-Briscoe Motor Co., chairman; William E. Metzger, Everitt-Metzger-Flanders Co., secretary-treasurer; Russell A. Field, 1777 Broadway, New York, assistant secretary-treasurer; H. E. Coffin, Chalmers-Detroit Motor Co., chairman of the rules committee; advisory committee, representing the combined interests of the manufacturers' association upon the board; Messrs. E. P. Chalfant (A. L. A. M), Alfred Reeves (A. M. C. M. A.), E. R. Hollander (I. A. S.), and S. A. Miles (N. A. A. M.).

Lookout Mountain Date Changed.

Originally planned for this month, the three days race meet and hill climb on Lookout Mountain, which has been promoted under the auspices of the Automobile Club of Chattanooga, Tenn., has been redated and will occur sometime during the latter part of next month, the hill climb probably occurring on the 22d. Seven different classes will be arranged for stock machines, and great expectations are held as to the spectacular nature of the affair owing to the tortuous nature of the mountain course.

Forty Entries for Atlanta Climb.

When the entries closed last Saturday, 20th inst, 40 nominations had been received for the annual hill climb at Atlanta, Ga., on the 27th inst., under the auspices of the Fulton County Automobile Club. Seven events are on the program, with silver cups to the winner in each class. A preliminary event for motorcycles will whet the appetite of the spectators for the big events which are to follow.

DETROIT THE STARTING POINT

Official Announcement that Glidden Tour Will Begin at that City—Hotel Train to Accompany the Tourists.

Confirming a long series of pretty well authenticated rumors, the contest board of the American Automobile Association announced late last week that the forthcoming annual touring contest of the A. A. A. —otherwise the Glidden tour—will start from Detroit. Further details as to the route of the contest are still withheld, pending the completion of arrangements for the housing and care of the tourists, but it is pretty well understood that Chicago and Minneapolis will be counted as important stopping places in the western itinerary.

Coming after strong appeals had been made by a number of other cities, Detroit's application was carried through with cyclonic energy. Entry of fifteen local cars was promised at the outset, and this offer, conditioned on the acceptance of Detroit as a starting point was later clinched by the tendered deposit of $3,000 to cover the entrance fees of the cars, at $200 each, which was made by President George E. Lane, of the Detroit Automobile Dealers Association. In addition to this, arrangements already have been made to secure ample headquarters for the tour in the large dining room of the Hotel Pontchartrain, while public spirited citizens have combined to offer a cup for the miniature tonneau class, not as a challenge trophy, but as a permanent award for this particular tour. The latter offer is to be laid before the contest board at its meeting in New York during the first week in April.

A decorated automobile parade is another local feature promised in connection with the start of the tour.

While the details of the plans which are forming for the conduct of the tour are shrouded in considerable mystery, this much has been announced in addition to the starting point of the tour—that the bodily welfare of the tourists en route will be looked after a part of the time at least, not by local inn-keepers, but by the Pullman Hotel Co.—otherwise—the Pullman Palace Car Co. A special sleeping and eating train will follow the tour from siding to siding, as a railroad construction gang is followed from point to point by the living cars, and each night when away from the reach of central towns and cities the weary motorists will be safely stowed away in the snug comforts of their own little "uppers" and "lowers." Arrangements already have been made for the provision of sleeping and dining accommodations for 300 tourists, but the negotiations for hauling the train from point to point are being arranged by chairman Hower, who is now in Chicago.

MOTORING IN SNOWY WASTES

Arctic Adventures Between Washington and Baltimore in March—Florida Tells How He Conquered the Drifts.

Being snow-bound in March is an adventure which few motorists would expect to encounter or care to experience. Yet just such an episode forestalled the plans of a number of wayfarers who had planned to return from the recent Taft inaugural in the same way in which they had gone to it—in their automobiles. One party only got through before the warm weather had largely effaced all traces of the unseasonable blizzard which so nearly had obliterated from the map the National Capitol on its greatest occasion. The sole survivor of a number of hardy adventurers who had essayed the northern trip with their machines was Jim Florida, Vanderbilt Cup contestant and otherwise veteran of a number of other conspicuous events, who with his Locomobile "30" touring car not simply attempted but achieved a rugged passage through to Baltimore.

As Florida himself tells the story, they left Washington at 10 o'clock Sunday morning with clear skies and air so balmy and warm as almost to make them regret having provided themselves with the equipment of shovels, axes and other pioneering outfit with which the car was laden. For the first few miles the pike road was in fair condition. Then upon a side road leading to Ashton, 15 miles away, the first real difficulties began to be encountered in drifts which were waist high. Says Florida:

"We opened up the road for about two miles, then we saw a driveway into a plowed field which the farmers had been using as a road for a distance of about two miles, the snow in the road at this place being up to our shoulders. To get into the field, we had to jump a big ditch about two feet wide and as deep. Our first attempt was a failure, as the rear wheels fell in up to the hubs. Our first use for fence rails came here; we used up over a dozen rails to raise it up and build a road under it, so as to get over the ditch and up the embankment into the field. We started through the field on low gear, until, when about half way from the road our car fell into a big hole, mud over the running boards- car laying on fly wheel, motor stuck fast and for the second time, some more digging and road building. The fence at this place was about 400 yards away and meant considerable walking through knee deep snow and mud to get some 20 rails. From the hot sun, the field became a sea of mud.

"Having spent three hours and gained only two lengths as we kept sinking more and more, we decided to give up the attempt of getting through the fields, and to get back to the road, seeing some 20 linemen who were putting up telegraph wires, we got them to give us a lift and turn the front of the car around towards the road, shoulder deep in the snow, which we had tried so hard to avoid. We headed for the road and had again to jump the ditch; being down hill the good little car hurdled it in great shape, the fly wheel sticking and stopping the motor. Here the car was covered in the snow, and we had to shovel tons of snow to get an opening. The shoveling was continued for about one and a half miles. Getting through this we were able to drive for a little way, when we went up against it again, here we had a choice of shoveling as far as we could see or shovel for about 50 yards to gain entrance to a field. We took the latter."

From this point on, the road appeared good, in the light of what had been encountered. But before long the difficulties of fallen poles and wires began to multiply. Highland was reached after dark, and undaunted, Florida and his crew started on with lanterns, determined to get as far as possible. Finally it came to the triple alternative of avoiding the roads for the bottomless fields, shoveling through three miles of snow on the highway, or as Florida puts it, moving "385 tons" of snow, or accepting the hospitality of a farmer over night. The latter was their choice, needless to say.

By morning the fields had frozen over sufficiently to sustain the weight of the car. But when the road was reached again, there was practically two miles to be shoveled before Clarksville was reached. Then only 24 miles of clear road remained to Baltimore. The first stretch required all of two hours; the second less than 50 minutes.

MOTORING FROM WASHINGTON TO BALTIMORE THE SUNDAY AFTER INAUGURATION DAY

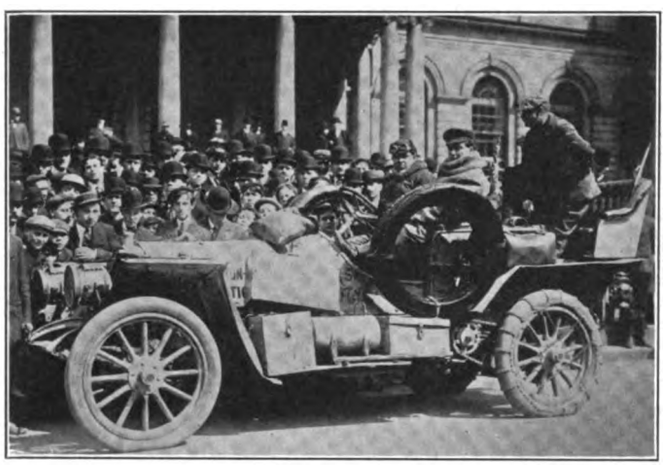
PATHFINDER BEGINS LONG JOURNEY



George Miller and His Thomas Car Get Official Send-Off from New York to Seattle—Making Good Progress.

A mild amount of interest has been aroused over the projected New York to Seattle tour of next June, by the incidents connected with the start from New York last Saturday, 20th inst., of the Thomas pathfinding car, and its reported progress from point to point since that time. The particular Thomas car selected for the difficult exploit of searching out in the early spring the roads which will be most feasible for the purposes of the tour in early midsummer, is said to be the identical machine, which a little more than a year ago performed the difficult feat of exploring a portion of the Alaskan territory merely as a side issue to its winning the race from New York to Paris. Certainly the extent of its equipment on Saturday gave the impression that both it and its crew must be prepared to face all the vicissitudes which the upcountry portions of any two continents might be expected to afford.

Carrying a letter from Mayor McClellan, of New York, to Mayor Miller, of Seattle, the pioneering expedition was officially despatched from City Hall in mid-afternoon. Prior to the start, George Miller, the driver, who acted as mechanic during the latter part of the New York to Paris race; C. W. Eaton, his mechanic; L. W. Redington, who will observe the road and route conditions during the trip, and J. S. M. Sley, representing the Thomas Co., were tendered an informal reception in the offices of the Mayor, his secretary doing the honors in the absence of His Honor himself. A secondary and hardly less impressive send-off was afforded the car and its crew on its way uptown when Robert Lee Morrell presented Miller with a flag which he charged him to carry across the continent in token of the interest of the Automobile Club of America in the trip and in the contest which is to be run under its official sanction. The second speeding ceremony took place before the A. C. A. club house.

The departure was witnessed by a kindly disposed crowd of not overwhelming proportions, while the car was accompanied on the early stages of its journey by a sizeable convoy of other cars, many of which bore the little "A. Y. P." banderoles, which are to be the standard of the tour. Later reports showed the car to be struggling with the snow-drifts in northern New York State, but making good progress, all things considered.

Efforts at booming the race on the western coast, particularly in the vicinity of Seattle have been productive of great enthusiasm. The purpose of the tour in advertising the Alaska-Yukon-Pacific exposition as well as serving as a competition for the Guggenheim trophy, has been warmly endorsed by local enthusiasts. Not only have the citizens of Seattle subscribed for a fund of $5,000 to provide the necessary cash prizes for the contestants, but preparations are being made for the erection of a building on the exposition grounds where the victorious cars will be exhibited during the remaining months of the expostion without charge to their owners. Supplementing this, it is stated that the cars are to be shipped back to the starting point free of charge to the contestants—a generous plan which should serve as an able inducement in stimulating entries.

START OF NEW YORK-SEATTLE PATHFINDER

MILLER PILOTING THOMAS UP BROADWAY

Narragansett Park to be Motordrome.

Having long passed into history as a scene for "horse trots," Narragansett Park, onetime among the most famous racing parks in the country, is about to be converted into an automobile race course, according to Fred E. Perkins, who has been identified with the ownership of the track for a number of years. As soon as weather permits, the work of reconstructing the old Providence course for its new purpose of automobile speed contests will be undertaken and carried forward as rapidly as possible.

PLANNING A CARNIVAL FOR LOWELL

Heinze Launches the Proposition and Local Merchants Respond—Nest Egg Laid for Necessary Funds.

Through the energetic efforts of J. O. Heinze, president of the Lowell Automobile Club, who was instrumental in bringing the Labor Day race of last fall to a climax, the city of Lowell, Mass., is again faced with the opportunity of taking to itself an increment of fame in the automobile world by the establishment of a carnival sometime during the coming fall. To this end, a meeting of local merchants was called early last week, and another on Friday, a preliminary subscription of $1,000 being raised as a nucleus for a sinking fund to carry out the plan. Last fall, considerable sums of money were spent in floating the road race, which, as it only lasted one day, did not afford opportunity for securing a proper return on the investment in highway repair, grandstand construction and so on, as Mr. Heinze, who provided a large amount of the enthusiasm for that undertaking now points out. By the institution of a carnival period of three days or a week, however, he now sees possibilities not only of entirely concelling whatever expenditure might be necessary to promote it, but of recouping local capital in some measure to make up for the deficit of last year. He is quite certain that Lowell business interests even outside the automobile business would be sure to profit largely as a result of the advertising which the city would obtain.

Another Race in Fairmount Park.

Permission has been granted by the Fairmount Park Commission for the holding of a stripped stock chassis race on October 7, over the same boulevard course in Philadelphia as was used during Founders' Week last fall. The Quaker City Motor Club, which is to promote the event, has announced the distance as 200 miles.

College Course in Rubber Chemistry.

A departure from the usual curriculum in vogue in colleges and technical schools is announced by the faculty of Buchtel College, Akron, O., who at the opening of the new college year in September will put on a course in rubber chemistry. Such an innovation is particularly adapted to Akron, which is the home of several of the large tire plants and it is instituted in response to a demand for instruction in the treatment of rubber by employes of the tire factories. The course will extend over a period of two years and a preparatory training of the same length in the rudiments of chemistry will be required to be eligible.

The first year's program will consist of the analysis of samples of rubber in various stages, the study of various solvents of rubber and similar phases. In the final term a more comprehensive and intimate knowledge of the subject will be introduced. A new chemical laboratory is now in course of erection in which to carry on the work.

New Snap for the Snapshot Artist.

Itinerant photographers in New York City have found that newly arrived sailors and family groups in the tenement districts are not the only classes of custom to which they may look. It has been discovered that chauffeurs, waiting on the street with their cars, are not averse to being "snapped." Some of the motor car drivers claim that they have found such pictures of themselves very useful when hunting new jobs, the photographs giving evidence of the truth of their assertions as to what cars they have driven and also permitting the prospective employer to judge of the appearance and "form" of the driver when in service.

Bogus Tire Repairer in a New Game.

C. C. Smith, of the Jamaica Tire Repair Co., Jamaica, N. Y., would give a few dimes to lay hands on a man who is taking his name in vain; so also would a number of automobilists from whom the bogus Smith gathered tires which he failed to return. The much-wanted Smith is the perpetrator of a new but simple swindle that does credit to his misdirected ingenuity.

Representing himself as C. C. Smith, of the Jamaica Tire Repair Co., and presenting Smith's business cards, he called on a number of Brooklyn automobilists soliciting the repair of their tires. He quoted such attractive prices for the work that at least five doctors and one undertaker "succumbed" and permitted "Smith" to carry off one or more tires, to the Jamaica shop, as they supposed. That was the last the medicos and funeral director saw of their property. They never reached Jamaica.

The police are looking for the bogus Smith, who is believed to be a man who recently applied to the Jamaica concern for work and who helped himself to a supply of its visiting cards when he took his departure.

Wireless "C. Q. D." for Automobiles.

Passing automobiles that use high tension ignition with the vibrator system give off ethereal waves that influence some types of wireless telegraph apparatus, according to dabblers in the wireless science, and consequently puzzle the message receivers at times by the electrical disturbances they create. Built on this hypothesis, the proposal is advanced that motorists equip their spark coils with telegraph keys and learn sufficient of the code to flash "C Q D" signals in cases of distress.

Automobiles in Battle of Flowers.

An automobile section will be one of the features of the forthcoming Battle of the Flowers parade, which is to be held in San Antonio, Tex., on April 21st. Arrangements are in the hands of the San Antonio Automobile Club, which also is anxious to promote a race meet during the week.

Lonsdale Club's Annual Election.

The recent election of officers of the Lonsdale (Pa.) Automobile Club for the ensuing year resulted as follows: Dr. J. W. Bawman, president; H. S. Louder, vice-president; T. R. Bright, secretary, and Henry B. Freed, treasurer.

Fulton County Club Acquires Home.

After a diligent search on the part of the club house committee, in which many proffered sites were considered, the Fulton County (Ga.) Automobile Club has found itself a home, located 7½ miles from Atlanta on a spacious tract of land, accessible to all roads on the north side and commanding a picturesque view of the surroundings. The new club house for some years has been the country residence of a wealthy Atlantan and is considered one of the most beautiful homes in the vicinity. Being already equipped with electric lights, telephones and all modern conveniences, it is admirably adapted to the needs and pleasures of the club.

The Fulton County Automobile Club was organized last fall, and its already large membership is destined to be well augmented by the acquisition of the new house.

Cincinnati Club Nears the 500 Mark.

At the recent annual meeting of the Cincinnati (O.) Automobile Club the reports of the officers disclosed among other things that the organization now has 458 members on its rolls. The officers elected were: Dr. C. L. Bonifield, president; D. McKim Cooke, first vice-president; G. W. Drach, second vice-president; Dr. L. S. Colter, secretary; Harry L. Manss, treasurer; E. J. Carpenter, consulting engineer; board of governors, two year term, Dr. G. M. Allen, J. P. Orr, George W. Cleveland, W. M. Perin, Dr. A. B. Heyl; one year term, Louis J. Merkel, A. P. Streitman, E. A. Conklin, Val Duttenhofer, Jr., and Paul Verkamp.

Russian Police Will Scan Motorists.

Foiled for months in their attempts to locate the source of a great volume of revolutionary printed matter, the Russian police have at last solved the mystery by seizing an automobile which has for some time been piquing their curiosity. The machine, which has been flitting from one district to another, was stopped in Riga, and when it was searched, revealed a complete printing establishment for producing inflammatory literature.

The Week's Patents.

904,163. **Indicator for Radiators.** Harry Vissering, Chicago, Ill. Filed April 29, 1907. Serial No. 370,951.

1. The combination with a water cooling radiator, of an indicator mounted thereon and comprising an upright tube communicating at its lower end with the top of the radiator and provided at its side with a window.

904,352. Pneumatic Spring. William C. McCullough, Bucyrus, Ohio. Filed Nov. 25, 1907. Serial No. 403,765.

1. In a device of the class described, the combination with a vehicle axle and vehicle spring, of plates carried by both, a flexible bag located between the plates, and inflexible reservoir tanks attached to the bag and supported by the springs.

904,358. Clutch. Carl T. Painter, Chattanooga, Tenn., assignor to Patten Manufacturing Company, Chattanooga, Tenn., a Corporation of Tennessee. Filed Nov. 16, 1907, Serial No. 402,563. Renewed Sept. 25, 1908. Serial No. 454,775.

1. A clutch comprising a divided ring, a lever pivotally supported by said ring, spring means acting against the lever at one side of its pivot, and means to directly engage said lever and shift the same in opposition to the spring means to expand the ring.

904,409. Pneumatic Tire. John L. Coesir, Joplin, Mo. Filed Jan. 30, 1908. Serial No. 413,481.

1. The combination with a wheel rim having inwardly extending annular clenchers, and a felly interposed between the clenchers; of a tube embracing the rim and clenchers, and having inturned edge portions insertible between the felly and the clenchers, an annually exposed non-inflatable circular wedge interposed between the felly and each edge portion of the tube, for binding said portion in engagement with the adjoining clenchers and constantly exposed means upon said wedge for expanding the same to secure the edge portions of the tube upon the clenchers.

904,413. Traction Wheel Drive. Jean B. Dumais, Chicago, Ill., assignor of one-half to Frank R. Crane, Chicago, Ill. Filed May 8, 1908. Serial No. 431,685.

1. In a traction drive for motor vehicles, a traction wheel provided with a housing having a circular rim portion in concentric relation to the axis of rotation of the wheel, a driving axle upon which the wheel is journaled, a sleeve mounted loosely upon the axle and formed with a circular flange, an annular clutch carried by said flange and formed with a peripheral gap, and an intermediate lever pivoted to said flange with its outer end engaging lever pivoted to said gap and its inner end in operative engagement with the axle, substantially as set forth.

904,434. **Oil Pump.** Russell Huff, Detroit, Mich., assignor to Packard Motor Car Company, Detroit, Mich., a Corporation of West Virginia. Filed March 23, 1907. Serial No. 364,142.

1. In an oil pump, the combination of a plunger having a longitudinal slot extending through its outer end, a sleeve adjustable on the plunger to vary the length of the slot therein, and means extending into said slot and adapted to reciprocate the plunger.

904,435. **Protector** and Non-Skidding Band for Pneumatic Tires of Wheels. Albert T. Hughes, London, England. Filed Oct. 18, 1907. Serial No. 398,070.

A tire protector consisting of a series of circumferentially arranged hinged tread elements adapted to grip the tire and each having each side thereof provided with a dovetailed recess, whereby the recess of each opposing pair of elements will constitute a dove-tailed socket, and resilient studs mounted in said socket and projecting from the outer faces of the tread elements.

904,508. Carburetter. William M. Carlin, Indianapolis, Ind. Filed Feb. 19, 1908. Serial No. 416,701.

1. In a carburetter, the combination with a hollow cylinder having its top end closed and its bottom enlarged end open, an air inlet valve situated over said enlarged open bottom end, a mechanism connecting said valve and the steering shaft of the vehicle whereby the valve closure is effected to control the vacuum in said cylinder, and an outlet situated near said top closed end, of said cylinder of a fluid duct situated intermediate the ends of said cylinder, and having an inlet end situated exteriorly of said cylinder, a needle valve sleeve guide extending vertically from said duct and situated centrally of the interior of said cylinder, said guide having a fluid fuel outlet, a valve seat situated at the bottom of the bore of said guide sleeve and a needle valve spindle fitted into said guide sleeve to slide along longitudinally therein, a needle valve on the end of said spindle coacting with said seat, and a disc situated at the top portion of said spindle and connected thereto, said disc of smaller diameter than the interior diameter of said cylinder.

904,570. Supplemental Wheel for Motor Cars. Milton D. Stocking, Lindenwood, Ill. Filed Feb. 3, 1908. Serial No. 414,107.

1. A supplemental wheel for motor cars adapted to have an engagement with the hub of one of the main wheels of a car and connected to the main wheel by devices having screw-threaded shanks, and a crank for each shank and having an end with a screw threaded opening.

904,659. Carburetter. Edmund J. Thompson, Ottawa, Ontario, Canada, assignor, by direct and mesne assignments, of one-fourth to Berton Herbert Sills and one-fourth to Russell Sutherland Smart, Ottawa, Canada. Filed Feb 6. 1908. Serial No. 414,663.

1. In a carburetter, and in combination a spray nozzle, a rotatable member controling the passage of combustible therethrough, a movable air controlling member actuated automatically by the suction of the engine and means operated by the movement of the air controlling member for rotating the said controlling member.

904,723. Automobile Transmission Mechanism. Milton O. Reeves, Columbus, Ind., a Corporation of Indiana. Filed Oct. 19, 1907. Serial No. 398,234.

1. A driving train comprising two shafts, a pair of driving elements on the first of said shafts one larger than the other, a pair of corresponding driving elements on the second shaft one larger than the other, and

U & H MAGNETOS

The New Members

of the U & H family are in line with the demand for magnetos which shall combine simplicity and moderate price with the perfection of working, which has always characterized the best imported magnetos. In every smallest detail they maintain the high standard of design and finish which has made U & H MAGNETOS notable for reliability.

CB—A magneto for small 4 and 6 cylinder motors. Price $100
LB—A magneto for large 4 and 6 cylinder motors. Price $125
CD—Same size as CB, but with a separate coil for battery use only. The magneto itself is of standard U & H arc flame type, with high tension current induced in the secondary winding of the armature. The battery operates through a special timer on the magneto and uses the magneto distributor. Price, complete with coil and high tension switch $125
LD—Same size as LB, but has provision for dual ignition similar to CD. Suitable for the largest motors. Price, complete $150
TYPE CG-3—For two cylinder motors. Price $60

J.S. BRETZ COMPANY

means for shifting one of the driving elements of the second shaft into and out of co-operative alignment with its corresponding element of the first shaft, the proportion between the several elements being such that, when said shiftable element is in co-operative alignment and driving engagement with its co-operating element, the other pair of elements cannot be brought into driving engagement though in co-operative alignment.

904,790. Stuffing Box for Engine Valves. John J. MacMulkin, Huntington, N. Y., assignor of one-fourth to Henry P. Palmer and one-fourth to Charles A. Singer, New York, N. Y. Filed March 10, 1908. Serial No. 420,138.

1. A device of the character described comprising a valve chamber having a valve therein, a stem for said valve projecting beyond said valve chamber, a spring pressed stuffing box mounted on the projected portion of said stem, and a gland for said valve stem mounted in said valve chamber and having an exteriorly projecting end portion that extends into said stuffing box.

904,799. Starting Device. Arthur E. Nelson, Cohoes, N. Y. Filed Sept. 20, 1907. Serial No. 393,858.

1. In a starting device for the crank shaft of an automobile, a casing formed in two parts loosely mounted on the shaft, a ratchet and pulley keyed to the shaft, a lever, one of said parts having worm-teeth, while the other part has means to be co-operated with by said lever and provided with weighted means to co-operate with the ratchet, a stop for said weighted means, and means for transmitting power from said pulley to the part having the worm teeth so as to rewind the spring.

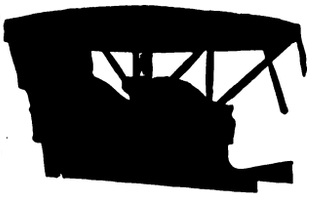
904,837. Cushioning Device for Vehicles. Alexander Carpenter and Charles C. Kissell, Findlay, Ohio. Filed Oct. 30, 1907. Serial No. 399,897.

1. The combination with superposed members, one of said members having a socket and oppositely disposed spaced retaining webs within the socket, and an axle engaging extension depending from said member; of a stem upon the other member and movably mounted within the socket, said stem having a reduced portion movably mounted between the webs, a head upon said reduced portion and insertible between and under the webs, said head and webs co-operating to prevent separation of the members when in a predetermined relation, and a cushioning device interposed between the members.

904,855. Carburetter for Internal Combustion Engines. Giovanni Enrico, Turin, Italy, assignor to F. I. A. T. Societa Fabbrica Italiana Automobili-Torino, Turin, Italy. Filed Nov. 27, 1906. Serial No. 345,359.

1. In a carburetter for internal combustion engines, a hydrocarbon valve, an air valve, and means for connecting said valves so that they may be moved together to vary the quantity of mixture, such means being adapted to permit a relative manual adjustment of such valves and the automatic return thereof to their original relative positions.

904,868. Transmission Gear for Motor Vehicles. Hans T. Hansen, Chicago, Ill. Filed Dec. 26, 1907. Serial No. 408,047.



1. The combination with a planetary gear, of means for taking power from one extreme pinion thereof, means to drive the other extreme pinion at a speed not exceeding the speed of the prime mover and for driving the intermediate pinion carrying member at a variable speed, and means for positively preventing relative rotation between the extreme pinion to which power is applied and the intermediate pinion carrying member when moving at substantially equal speeds.

904,998. Self Propelled Vehicle. Charles Richter, Tampa, Fla., assignor to himself and Louis Fromer, Tampa, Fla. Filed Dec. 26, 1907. Serial No. 407,998.

1. A self propelled vehicle adapted to travel on land or on water and having a buoyant body, a common wheel adapted for propelling the vehicle on land or on the water and arranged to rotate in one plane only, and means for adjusting said wheel whereby the latter is adapted for steering the vehicle on water.

HARTFORD

EVERY tire, no matter how poor, has its patrons and its partisans; but the one true tire test is — time and travel.

Find, among your friends, the old and experienced motorists—men who have driven cars for four, five or six years; and tried, perhaps, every prominent tire produced.

In the majority of cases you'll find them committed beyond the possibility of change to

HARTFORD TIRES

"The Tire That Lasts"

There's a definite, concrete reason for this—partially expressed in the phrase "The tire that lasts."

Hartford tires DO last—because they are designed right to begin with; because the heavy tread is compounded exactly right; because the fabric is specially woven Sea Island Cotton; because the cushion is absolutely pure Para; because Hartford Inner Tubes are made to fit without folding, straining, or wrinkling, which means durability impossible in a tube vulcanized on a straight mandrel.

If you are inexperienced in buying tires or dissatisfied with your experience, consult those who have driven long and hard—almost inevitably they will direct you to the Hartford Tire—"The Tire That Lasts." Ask for Hartford Clincher Tires and Tubes on your new car or try a set the next time you renew.

We recommend Standard Universal Quick Detachable Rims.

The Hartford Rubber Works Co., HARTFORD CONNECTICUT

MORGAN & WRIGHT TIRES ARE GOOD TIRES

Good for the motorist who wishes to cut down his car maintenance bills

Any experienced motorist knows that the size of tire bills is not determined entirely by the *length* of service of the tires. Repair bills are a big factor to be reckoned with.

Morgan & Wright tires will last a long time. We can cite plenty of cases where motorists have obtained 10,000 miles' service or more from a set of our tires by giving them proper care and inflation. We are proud of these records, *but*—

While we recognize the importance of large mileage, we lay even more stress on this point: Morgan & Wright tires require mighty little repair-shop assistance in making their records. The *"assistance" is put into the tires before they leave the factory.*

MORGAN & WRIGHT, Detroit

Franklin Car makes perfect score on Timken Roller Bearing and Axle in Bretton Woods Endurance Run.

The 24-hour Bretton Woods Endurance Run of the Bay State Automobile Association, was planned with a view to being so severe as to break the perfect score with which each of the 21 contestants started, in a tour of 369 miles.

Instead of being a 24-hour run of 369 miles, it was a 1,627-mile contest consuming 95 hours, running without adjustment.

Never in the history of automobiling was there a more severe or ability-proving test. The route was the most difficult that could be selected, up steep grades, over roads so rough they required much low gear work, and so dusty as to interfere with the operation of some of the cars.

The Franklin car completed this remarkable run with a perfect score.

The fact that this car was equipped with TIMKEN ROLLER BEARINGS is additional proof that manufacturers realize TIMKEN PRODUCTS are indispensable for getting maximum power and endurance out of their cars.

Write for descriptive literature and special information.

THE TIMKEN ROLLER BEARING AXLE CO., Canton, Ohio
